Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model CB-1072. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6 volt, 21 cp. Dimmer and tail lamps are 6 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

Model X (1922-1923)
Delco System

Plate No. 821

CASE

MODEL X (1922-1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO SYSTEM

BATTERY.—Willard, Type SJRN-4, 6 volts. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159 for 1922 models and No. 2178 for 1923 models. Distributor Model No. 5207 for 1922 models and No. 5256 for 1923 models. Breaker contacts separate .012 to .016 inch. They are made of tungsten. If condition affects ignition, remove and resurface with a hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every 500 miles. If track of rotor button is not well polished, apply a small quantity of vaseline with a small cloth.

Timing.—Breaker points begin to separate when piston No. 1 is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps separate .025 inch.

STARTER.—Model No. 181. The direction of rotation, looking at commutator end, is clockwise. Free torque at 50 amperes, 3 volts. Lock torque 10 pounds at armshift, requiring 450 amperes, 2.3 volts. Brush tension set at 45 to 50 ounces. Cranks engine at 110 R.P.M., taking 300 amperes.

Oiling.—Put 8 or 10 drops of light engine oil every month or 1000 miles. Repack reduction gear housing with medium soft grease twice a season.

GENERATOR.—Model No. 165 for 1922 model and No. 258 for 1923 model. The rotation looking at commutator end is counter-clockwise. The third brush system is employed for current output regulation. Maximum charging rate is 13 to 17 amperes, attained at 1600 R.P.M. of armature.

Generator Test Datas

Amperes	Hot Test	R.P.M.
0.0		650
4.5		800
Max. 13-17		1600
9-12		2300

Main brush tension at 25 to 35 ounces and third brush set at 20 to 30 ounces.

Oiling.—Put 8 or 10 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 650 R.P.M. of armature, and opens at 550 R.P.M. Relay contacts separate .046 to .062 inch, and air gap, between armature and coil core, separate .025 to .035 inch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Auxiliary lamps, 6-8 volts, 4 cp. Dash, tail, side and tonneau lights are 6-8 volts, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating the current is 3.5 amperes. Vibrating ceases at 15 amperes.

STEPHENS

MODEL 10-20 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—U. S. L., 313-X, 6 volt, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5257. The contact points are made of tungsten. If condition of contacts affects ignition, remove and resurface on a medium hard oilstone. Breaker contacts separate .020 to .027 inch.

Oiling.—Put 4 or 5 drops of light engine oil into distributor oiler once every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts separate when piston entering power stroke is at top dead center.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model No. 262. The direction of rotation, looking at commutator end is counter-clockwise. Brush tension is $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds. Stall torque is 10 pounds, taking 450 amperes at 2.3 volts. Starter running free takes 50 amperes at 6 volts. Connection to the engine is through a Bendix drive.

Oiling.—Put 4 or 5 drops of light engine oil into starter oilers every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise. The third brush system is employed for current output regulation. The maximum charging rate is 18 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
4		800	4		800
8		1000	9		1000
14-16		1600	15-18		1600
15		2000	17		2000

To adjust the charging rate loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of all the generator brushes should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be given once every 500 miles.

RELAY.—Model No. 5754. Relay closes at 6.75 to 7.5 volts and opens at 3 amperes discharge. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Auxiliary lamps are 6 volts, 6 cp. Dash, tail, tonneau and side lamps are 6 volts, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes. Vibration continues to function with a current flow not exceeding 15 amperes.

Model 20-25 (1923)
Bosch Systems

Plate No. 823

DORT

MODEL 20-25 (1923) BOSCH GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volts, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model T-C-20. Breaker contacts separate .023 inch. They are made of tungsten. If condition of points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into wick oilers once every month. If car is driven more than 1000 miles, this attention must be given every 1000 miles.

Timing.—Breaker begins to separate when top dead center of No. 1 piston is reached, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps separate .025 inch.

STARTER.—Model G-D-525. The direction of rotation, looking at commutator end of starter, is counter-clockwise. Cranks engine at 150 R.P.M., requiring 110 amperes.

Starter Data

Torque	R.P.M.	Amperes
12 ft. lbs.	160	440
15 ft. lbs.		550

Maximum resistance is 0.0075 ohms, current being 400 amperes at 3 volts.

Oiling.—Put 4 or 5 drops of light engine oil into starter oilers every month.

GENERATOR.—Model G.D.636. The direction of rotation looking at commutator end of generator is counter-clockwise. The third brush system is used to regulate the current or voltage. The maximum charging rate is 14 amperes, reached at 1200 R.P.M. of armature or 16 miles per hour of car in high gear.

Generator Test Data

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	500
7	660	7.5	660
10	900	11	900
12	1100	13	1100
14	1200	16	1200

Oiling.—Put 4 or 5 drops of light engine oil into generator wick oilers once a month. If car is driven over 1000 miles in a month, this attention must be given every 1000 miles.

RELAY.—The relay is mounted on generator housing, closed at 7 miles per hour or 500 R.P.M. of armature and opens at 7 M.P.H. or 500 R.P.M. of relay armature. Relay contacts separate .013 to .018 inch. The air gap between coil core and relay armature is .031 inch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. A dimmer resistance is used. Dash lamp and tail lamp are 6-8 volts, 2 cp. Dome lamps are furnished with closed cars only.

FUSES.—There are only two fuses, each 10 amperes.

HUPMOBILE

SERIES R (1923)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Willard, Type SJRN-4, 117 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. N-3. Distributor Model No. R-A. Breaker contacts separate .014-.016 inch. When the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. The contact points must be parallel when installed. The ignition current is approximately 3 amperes, engine idle, breaker contacts and ignition switch closed.

Oiling.—Place 4 or 5 drops of light engine oil in the oil cup and apply a small amount of vaseline to the cam with a toothpick once to every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given to every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .020 to .022 inch.

STARTER.—Frame No. 33A.B. Style 298,808. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter armature revolves at 3700-4100 R.P.M., taking 70 amperes at 5.5 volts. The torque at 1600 R.P.M. is 1.75 pound-feet, the current being 150 amperes at 5.5 volts. The lock torque is 12 pound-feet at 4 volts, the current being 500 amperes. The pressure of the brushes on the commutator is 1 to 1½ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Frame 760, Type A-T-35. Generator current regulation is by the third third brush system. Maximum current output is 10-12 amperes (hot) at 1250 R.P.M. of the armature, or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	_____	450	0	_____	500
8	_____	675	6	_____	725
15-17	_____	1250	10-12	_____	1250
12	_____	840	9	_____	850
10	_____	2000	7-8	_____	2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6.0 to 6.6 volts. Operating as a motor the generator takes 5.0 amperes at 6.0 to 6.3 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the commutator end bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Style No. 262,982. Relay of type 760 is mounted on generator frame, on the outside on type A-T-35. Relay closes at 10 M.P.H., or 500 R.P.M. of armature or at 6.5 volts, and opens when there is a discharge of from 0-3 amperes. The contacts separate .030-.035 inch. The air gap between armature of relay and coil core is .005 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting circuit fuses are 10 ampere. Generator field fuse is 5 ampere.

ANDERSON **SERIES 40 (1923)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM** **REMY IGNITION**

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine flat, jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 705-A. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 250 R.P.M.

Starter Data			
Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10000	65	5.0
1 lb. ft.	3000	145	5.4
4 lb. ft.	1000	310	4.5
5 lb. ft.	800	350	4.4
12 lb. ft.	Lock	600	3.0

Above tests are made without the reduction gears.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 234-E. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit at a temperature of 175°F., reducing the charging rate 6 amperes. The thermostat is intended to change the charging rate as the demands of seasons or car operation requires. Never touch the thermostat points. Maximum current output is reached at 2000 R.P.M. of the armature or 28 miles per hour.

Generator Data		
Amperes	R.P.M.	Volts
0	525	6.4
7	780	7.1-7.2
19.5-20.5	1680	8.6
14	1100	7.8
19.0-20.0	2000	8.6
13.0-15.0	3000	8.0

Field winding takes 5 amperes at 6.4 volts. Pressure of main brushes on commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces. Position of third brush is adjusted by turning a screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 525-575 R.P.M. of the armature and opens at 7-9 miles per hour or 475-525 R.P.M. of the armature. Relay contacts separate .012-.015 inch. Air gap between relay armature and coil core is .012-.015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 5 ampere.

NATIONAL SERIES "BB" (1923)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 615-RHN, 6 volt, 125 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5211. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor shaft bearings every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Frame 751. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 4000 R.P.M., taking a current of 38-52 amperes at 5.5 volts. Cranking the engine at 100-150 R.P.M., taking a current of 175-275 amperes at 5-5.5 volts. Lock torque being 21 pound-feet, current being 650 amperes, at 4.8 volts.

Starter Test Data

Torque	R.P.M.	Amperes
2.5	1450	140
4.0	1150	200
8.5	650	310
10.0	500	350
21.0	Lock	650

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by the third brush system. Maximum charging rate is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour. The direction of rotation is counter-clockwise, looking at commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0		450	0		500
8		675	6		725
12		840	9		850
15-17		1250	11-13		1250
10		2000	7-8		2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated an hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes, when 6 volts pressure is applied to its terminal. When generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 450-500 R.P.M. of the armature or 8 miles per hour, and opens at 400-450 R.P.M. of the armature or 6 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay contacts. Contacts separate .013 to .018 inch. The air gap between the armature (moving member) and coil core is .031 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are 3-4 volts, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3 to 5 amperes.

FUSES.—One fuse is used in the generator, and it is 5 amperes.

LINCOLN

MODEL 1923

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3, LRVX-15-2, 6 volt, 135 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5226. Breaker contacts separate to .020 inch. If burned or pitted, affecting the ignition, resurface on a medium hard oilstone.

Oiling.—Put 3 or 4 drops of oil in the oiler every 250 miles. Also put light cup grease to a level just above the cover plate near the spark advance lever on the forward side of the housing every 5000 miles. A very small amount of grease or vaseline should be applied to the surface of the breaker cam every 2000 miles.

Timing.—The right breaker points should commence to open on the mark "RET" on the clutch-ring. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps are .025-.030 inch.

STARTER-GENERATOR.—Model No. 193. The starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears, meshed by the operator. Two overrunning clutches are provided in connection with the ignition switch. A circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses the operations. The direction of rotation is counter-clockwise, looking at the starter commutator end. The starter running freely, takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3 volts. The pressure of the starter brushes should be 2 1/4-2 3/4 pounds each.

GENERATOR.—Generator current regulation is by the third brush. It begins to supply current at a speed of 7 miles per hour. The maximum charging rate is 16 amperes, reached at 1400 R.P.M. of armature, or 20 miles per hour.

Generator Data.—Motor Generator No. 193

Amperes	R.P.M.
3	600
12	1000
14-16	1400
15	2000

To adjust the charging rate, loosen the commutator cover band and the locknut on the end of the generator. Then turn the adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put a few drops of good oil in front and rear oil cups of the starter-generator bearings every 250 miles.

RELAY.—There is no relay. It is controlled by the ignition switch.

LAMPS.—Head lamps, 6-8 volt, 21 cp. Side, tonneau extension, dash, dome, rear quarter and inspection lamps, each 6-8 volt, 4 cp. Cowl and rear lamps, 3-4 volt, 2 cp. Handy extension lamp, 6-8 volts, 4 cp. Signal lamp, 6-8 volts, 21 cp. All lamps are single contact.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. The vibrating circuit breaker in the lighting circuit begins to operate when the current flow reaches 25-30 amperes. While vibrating the current is not over 15 amperes. The lockout circuit breaker protects the horn and handy lamp circuits. A current of 25-30 amperes causes this device to operate. While operating the current flow is less than 1 ampere.

LINCOLN
Model 1923
Delco System
Plate No. 827

MOON

MODEL 6-40 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY—Exide, Type 3-XC-13-1, 6 volts, 85 ampere-hours capacity. The negative (—) terminal is grounded.

IGNITION—Coil Model No. 2178. Breaker contacts separate .020 inch. They are made of tungsten. If condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling—Put 4 or 5 drops of light engine oil into distributor oiler once a week. If car is driven over 250 miles in one week, this care must be given each 250 miles.

Timing—Breaker contact opens when piston No. 1 is at top dead center, entering on power stroke, spark control lever and breaker assembly fully retarded.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—Spark plug gaps separate .025 inch.

STARTER—Model 240. The direction of rotation looking at commutator end is counter-clockwise. The starter is connected to the engine through a Bendix drive. The lock torque is 12 pound feet.

Starter Test Data

Torque	R.P.M.	Amperes
0.0		50
1.0	2600	110
1.5	2175	140
2.0	1900	160
2.5	1650	180
3.0	1450	200

The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds on each brush.

Oiling—Put 4 or 5 drops of light engine oil into starter oilers every week. If car is driven over 250 miles in one week, this care must be given every 250 miles.

GENERATOR—Model No. 257. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is employed for current regulation. The maximum charging rate is 17 amperes, reached at 1400 R.P.M. of generator armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		460	0		440
4		600	4.5		600
9.5		800	10		800
13.5		1000	15		1000
15.5		1400	17		1400

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle on the plate. Shifting the third brush in the direction of generator rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate.

Oiling—Put 4 or 5 drops of light engine oil into generator oiler every week. If car is driven over 250 miles in one week, this care must be given every 250 miles.

RELAY—Relay closes at 7 to 8 miles per hour or 550 to 600 R.P.M. of armature, and opens at 5 to 6 miles per hour or 500 to 550 R.P.M. Relay contacts separate .046-.062 inch. Air gap between relay armature and coil core is .020 to .035 inch.

LAMPS—Head lamps are 6 volts, 21 cp. Auxiliary lamps are 6 volts, 4 cp. Dash and side lamps are 6 volts, 2 cp.

CIRCUIT BREAKER—Circuit breaker begins to vibrate when the current reaches 25 amperes, and continues to vibrate with 3 to 5 amperes.

CHEVROLET
Superior Model (1923)
Remy System

Plate No. 829

CHEVROLET

SUPERIOR MODEL (1923)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Exide, Type 3-XC-13-1, or Willard, Type SJXR-3, 6 volt, 90 ampere-hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plug gaps are .025 inch.

STARTER.—Model 711-B. The direction of rotation, looking at commutator end, is counter-clockwise. Starter is connected to motor by a Bendix drive. Cranks the at 160 R.P.M. taking 140 amperes. Starter brush tension should be 20-24 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
10 "	Lock	3.5	425

Oiling.—Put 4 or 5 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model 950-A. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for voltage regulation. The maximum charging rate is 18 amperes reached at 1800 R.P.M. of the generator armature. Brush tension is 14-18 ounces each. Shunt field current is 5 amperes at 6 volts.

Generator Test Data

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	640			
7	7-7.3	860	12-15	8-8.5	1750
15-17	8.3-8.8	1750			
8.5-15.5		2500			

To adjust the generator charging rate, loosen the generator cover band and the screw on the generator end plate. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Tail and coil lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 4 cp.

FUSES.—One fuse is used; 20 amperes.

CHEVROLET

SUPERIOR MODEL (1923)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

CHEVROLET
Superior Model (1923)
Auto-Lite Generating, Starting and Lighting Systems
Remy Ignition

Plate N . 830

BATTERY.—Exide, Type 3-XC-13-1, or Willard, Type SJXR-3, 6 volt, 90 ampere-hour.

The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Distributor Model No. 66-P. Breaker contacts separate .030 inch. When the condition of contacts affects the ignition, resurface on a medium hard flintstone.

Oiling.—Refill the grease cup under the breaker head with soft cup grease and turn bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—The spark plug diameters are 7/8 inch, gaps are .022 inch.

STARTER.—Model MF. Rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 150 to 160 R.P.M., normally, taking 160 amperes

Starter Data.—Model MF

Torque	R.P.M.	Amperes	Volts
2.0 lb. ft.	1550	190	5.1
4 lb. ft.	960	295	4.5
6 lb. ft.	500	390	4.0
7.5 lb. ft.	100	460	3.7

Stalled Torque Data

Volts	Lock Torque
2.0	5.6 lb. ft.
3.5	10.4 lb. ft.
5.0	15.0 lb. ft.

The brush tension is 2 pounds.

Oiling.—Thoroughly clean out and repack the starter bearings with soft cup or ball-bearing grease every six months.

GENERATOR.—G.H. 1012. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		700	0		660
6		1200	6		1000
10		1700	10		1300
12		2000	12		1500
13		2400	16		2400

The brush tension is 2 pounds. Charging rate is varied by adjustment of the third brush setting. Move the third brush in a counter-clockwise direction, looking at the commutator end, to increase the charging rate and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting the position. Operating freely as a motor, generator takes 2.7 amperes, armature revolving at 450 R.P.M. Shunt field winding takes 1.7 amperes.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 700 R.P.M. of the armature, and opens at 4 miles per hour or 600 R.P.M. of the armature. The discharge current is 0 to 2 amperes at opening of relay contacts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface them with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Tail lamp is 6-8 volts, 2 cp. Dome lamp is 4 cp. (used only in closed bodies).

FUSES.—Fuse is 20 ampere.

GRANT
Series 65000 (1922)
Bijur Generating, Starting and Lighting Systems
Atwater-Kent Ignition

Plate No. 831

GRANT

SERIES 65000 (1922)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 105 ampere-hours. The starting capacity is 120 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model N3. Distributor Model 46-CC. Breaker contacts separate .015 inch, fully separated. The contact points are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oil-stone.

Oiling.—Remove distributor cap every two weeks and put 4 or 5 drops of light engine oil into exposed oil hole. Put a small amount of vaseline on the cam, applying with a tooth-pick. If car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch. Spark plug gaps are .025 inch.

STARTER.—Type FD-140, M-1380. The starter is connected to the engine by a Bijur drive. Motor running freely at 5000 R.P.M. takes a current of 35-45 amperes, 5.8 volts. Cranking the engine at 150 R.P.M., requires a current of 250 amperes, 5 volts. Lock torque is 11.6 pounds-feet, current being 550 amperes, 4 volts. Pressure of brushes on the commutator is 30 ounces.

Oiling.—Put 5 or 6 drops of light engine oil into each of the starter bearing oilers every month.

GENERATOR.—Type P-230, M-1345. Generator current regulation is by the third brush system. Maximum current output is 14 amperes, reached at 1200 R.P.M. of the armature or 23 M.P.H. Charging rate reduces to 12 amperes at 30-40 M.P.H. Charging rate is varied by inserting a special toothed wrench in the adjusting hole in the commutator end plate and moving the third brush assembly through a ratchet engagement. Turn the adjusting wrench in a clockwise direction to increase the charging rate, and in the opposite direction to decrease the charging rate.

Generator Test Data

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
12	1200	14	1200

Oiling.—Put 4 or 5 drops of light engine oil in commutator end oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Drive end of generator is oiled by the splash of the engine.

RELAY.—Relay closes at 450 R.P.M. of armature, or 9 M.P.H., or 7-7.5 volts, and opens at 200-300 R.P.M., or 4-6 M.P.H., or 0-1 ampere discharge. The contact gap is .015 inch. The air gap between relay armature and coil core is .015 to .020 inch, contacts fully closed.

LAMPS.—Head lights are 6-8 volts, 21 cp. Tail, side and dash lamps are 6-8 volts, 2 cp. Signal lamp is 6-8 volts, 21 cp. Dimmer resistance is used. All lamps have single contact base.

FUSES.—Lighting fuses are 15 amperes, $1\frac{1}{4}$ inch long. Generator fuse is 15 amperes $\frac{5}{8}$ inch long.

EARL
Model 40 (1923)
Auto-Lite Starter and Generator
Connecticut Ignition

Plate No. 832

EARL MODEL 40 (1923) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L. Type, HDN, 313X, 6 volts, 95 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Connecticut, Model 16-C. Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when piston No. 1 before top dead center, $2\frac{3}{4}$ inch measured on flywheel, and spark control lever and breaker assembly fully advanced.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model MG-1013. Starter is connected to engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 4000 R.P.M., taking 40-60 amperes, 6 volts. Cranking engine at 125 R.P.M., requiring 150 amperes, 5 volts. Lock torque 13 pounds-feet, current being 450 amperes, at 3-4 volts.

Starter Data		
Torque	R.P.M.	Ampere
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	450

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model GJ-1013. Generator current regulation is by third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 16-18 amperes at 7-7.5 volts.

Cold Test (25°C)			Generator Data			Hot Test (75°C)		
Ampere	Volts	R. P. M.	Ampere	Volts	R. P. M.	Ampere	Volts	R. P. M.

15.5	6.8	1700	12	7.35	1850	12	7.35	1850

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7 volts and opens when there is a discharge of from 0 to 2 amperes. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp., S.C. Dash lamp is 6-8 volt, 2 cp. D. C. Side and tail lamps are 6-8 volts, 2 cp., S.C. Motor lamp, 6-8 volts, 2 cp., D.C.

FUSES.—Fuses are 20 ampere.

COMBINATION SWITCH.—Briggs and Stratton, No. 2267.

BUICK

MODEL 23-FOUR (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-13-1, 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor is integral with the motor-generator. Breaker contacts separate .0225 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, they must be removed and resurfaced with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The condenser is mounted within the breaker housing, and the resistance unit on the side of the housing.

Oiling.—See motor-generator oiling.

Timing.—Breaker contacts begin to separate when the seven-degree mark on the fly-wheel (which is approximately one inch after top dead center) is at the indicator, spark control lever and distributor drive shaft in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Diameter, 7/8 inch. Spark gaps are .030 inch.

STARTER.—Motor-generator Model Nos. 231 and 236. Starter and generator are one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with ignition switch, a circuit is closed, allowing the current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears opens the generator circuit, and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by the third brush system. The maximum charging rate should not exceed 18 amperes, hot adjustment, under any circumstances. To adjust the charging rate loosen clamp screw on third brush carrier (to right of bearing, looking at commutator end). Move carrier to left to increase charging rate, and to the right to decrease the charging rate. Tighten the clamp screw after position adjustment.

Test Data		
Amperes	R.P.M.	M.P.H.
8-9	825	
0	600	
Max. 14-16	1500	20
12-15	1800	

FIELD TEST.—Field draws 1.5-2 amperes, 6 volts.

Motoring freely at 250 R.P.M., taking 5-6 amperes, 6 volts, with over running clutch.

Oiling.—Put 4 or 5 drops of light engine oil in oiler provided for lubricating the rear armature shaft bearing every two weeks. Remove the front end cover over the commutator and put 3 or 4 drops of light engine oil in the exposed oil hole. Put 4 or 5 drops of light engine oil in the upper distributor shaft bearing oiler. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Refill starting gear grease cup with soft cup grease and turn down two turns every month. Every six months, remove the plate on the side of the distributor housing and refill with soft cup grease to a level just above the manual advance ring.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dome lamp is 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

BUICK
Model 23-Four (1923)
Delco System

Plate No. 833

6 CYLINDER MODEL (1923)

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash, tail and side lamps are 6-8 volt, 2 cp.

COMBINATION SWITCH.—Model No. 1159. A vibrating circuit breaker, mounted on the rear of the switch, takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating, the current is 3-5 amperes.

STAR
Model 1922-1923
Auto-Lite System

Plate No. 835

STAR MODEL 1922-1923 AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type CDN-311, 6 volt, 84 ampere-hours capacity. Starting capacity—96 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4041. Distributor Model IG-4030-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone. The condenser is now mounted in the distributor housing.

Oiling.—Fill grease cup under the breaker head with soft cup grease and turn down once every two weeks. Put 4 or 5 drops of light engine oil on the wick oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when No. 1 piston is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, and the gaps are .030 inch.

STARTER.—Model MG. The direction of rotation, looking at commutator end, is counter-clockwise. The connection to engine is by a Bendix drive. The motor running free at 4000 R.P.M. takes 40-60 amperes at 6 volts. Cranking engine at 125 R.P.M. it takes 150 amperes, 5 volts. Lock torque—12 pound-feet, 450 amperes, 3-4 volts.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR.—Generator Model GJ. The direction of rotation is counter-clockwise. The third brush system is used for current regulation. Motoring freely, generator takes 4-5 amperes, 6 volts. Field test, 2.2 amperes, 6 volts, each coil separately 8.8 amperes, 6 volts.

Generator Data

Cold Test. (25°C)			Hot Test (75°C)		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.

14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given to every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7-9 M.P.H., and opens at 450-500 R.P.M., 5-7 miles per hour. Relay contact gap separates .025-.035 inch. Air gap between relay armature and coil separates .010-.015 inch.

LIGHTING.—Head lights are 6-8 volts, 21 cp., S.C. Dimmer and tail lights are 6-8 volts, 4 cp., S.C. Dash light, 6-8 volts, 2 cp., S.C.

FUSES.—20 amperes.

DURANT 4
Model A-22 (1922)
Auto-Lite Systems

Plate No. 836

DURANT MODEL A-22 (1922) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volts, 84 ampere-hours capacity. Starting capacity—96 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Auto-Lite Battery Ignit-on. Breaker contacts separate .020 inch. They are made of tungsten. If condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into distributor oiler once every week. If car is driven over 250 miles in one week, this attention must be given every 250 miles.

Timing.—Breaker contacts begin to separate when No. 1 piston is on top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model MF. The direction of rotation is counter-clockwise. The connection to engine is by a Bendix drive. Motor running free at 4000 R.P.M. takes 40 amperes at 6 volts. Cranking engine at 110 R.P.M., it requires 120-160 amperes at 5.5 volts. Lock torque is 10 pound-feet, taking 400-450 amperes at 3-4 volts.

Oiling.—Put 4 or 5 drops of light engine oil into motor oiler once a week. This care must be given every 250 miles, if car is driven more than 250 miles a week.

GENERATOR.—Model GH. The direction of rotation is counter-clockwise. The third brush system is employed for voltage regulation. To increase output of the generator, remove brush band, loosen brass nut inside of generator housing above the commutator, and move third brush in a counter-clockwise direction; to decrease, vice versa.

Generator Test Data		
Amperes	R.P.M.	M.P.H.
0	550	—
8	900	—
14 Max.	1700	20

Motoring freely, generator takes 2.7 amperes at 6 volts. Field current is 1.7 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler once every week. If car is driven over 250 miles in a week, this care must be given every 250 miles.

RELAY.—Relay contacts closes at 500-550 R.P.M., 7-9 M.P.H., 6.5 volts, and opens at 450-500 R.P.M. of armature, or 5-7 M.P.H., 0-1 ampere discharge. Contact gaps separate .025-.035 inch. Air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING.—Switch, Connecticut, Type 187-3-Y. Head lamps are 6-8 volts, 21 cp., S.C. Dimmer and dash lamps are 6-8 volts, 4 cp., S.C. Tail lamp is 6-8 volts, 2 cp., S.C.

FUSE.—20 amperes.

MAXWELL

MODEL 1923

REMY GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY.—U. S. L., Type C.D.X.-313-X, 6 volts. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 284-L, Distributor Model No. 369C. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface them on a medium hard oilstone.

Oiling.—Fill distributor grease cup with soft grease and turn down two or three turns once a month. If car is driven over 1000 miles in a month, this attention must be given once to every 1000 miles.

Timing.—Contact points begin to separate when No. 1 piston is $\frac{3}{64}$ of an inch past top dead center on power stroke; as measured on flywheel is 10 degrees past top dead center, spark control lever and breaker assembly fully retarded. To adjust points to open at this position, loosen clamp which locks sparks lever to distributor head, and rotate distributor head until points begin to open with rotor under segment connected to spark plug No. 1.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters $\frac{7}{8}$ inch. Gaps are .027-.030 inch.

STARTER.—Starter Model 712-A. The direction of rotation is counter-clockwise, looking at commutator end. The connection to engine is by a Bendix drive. The motor running free at 4000 R.P.M., taking 50-60 amperes, 6 volts. Cranking engine at 150 R.P.M. Lock torque is 11 pound feet taking 450 amperes at 3.6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into starter oiler once a month. If car is driven over 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model No. 961-A. The direction of rotation looking at the commutator end is counter-clockwise. Generator running freely at 440 R.P.M. takes 6.5 amperes at 7.1 volts. Shunt field current is 5 amperes at 6 volts. The third brush system is used for current regulation. To adjust generator output, loosen locknut on outside of generator end plate and shift the third brush. Moving the brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the output. Before adjusting charging rate, make certain that fan belt is not slipping. If the fan moves even part of a revolution when the relay points are closed or if a higher speed than 20-25 M.P.H. is required to reach the maximum charging rate the fan belt is loose and slipping.

Generator Data.

Amperes	R.P.M.	M.P.H.
0	600	—
11-14	1000	—
12 Min.	1500	6.5
16 Max.	1500-2500	7.5
7	3000	—

Oiling.—Fill wick oiler with light engine oil once every two weeks. If car is driven more than 500 miles in two weeks, this care must be given once every 500 miles.

RELAY.—Relay points close 8-10 M.P.H., 7 volts; and opens at 7-8 M.P.H., 0-3 amperes discharge. Relay contacts separate .014-.025 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING.—Briggs and Stratton Lighting and Ignition Switches, Panel No. 1485 or 1562. Head lamps are 6-8 volts, 21 cp., S.C. Tail, side and dash lamps are each 6-8 volts, 2 cp., S.C. Dimmer lamps are 6-8 volts, 4 cp., S.C.

FUSES.—Fuses are 20 amperes.

WILLS SAINT CLAIR

MODEL A-68 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volts, 140 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5235. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oil-stone. Two sets of contacts are provided. They operate with a four sided cam and open separately. Each breaker cam controls one coil and fires one bank of cylinders. The distributor is provided with manual and automatic advance. Manual advance is 45-50°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-22° at 2000 R.P.M. The breaker arm spring tension is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of medium heavy grease on the breaker cam and on the track in the distributor head every 1000 miles. After polishing the rotor track with a clean cloth, remove all excess grease.

Timing.—Breaker contacts firing right bank of cylinders begin to separate when piston No. 1 entering power stroke reaches a position 7° past top dead center (measured on flywheel) with the spark control lever and breaker assembly in the fully retarded position. This position is reached when the flywheel marking EC-1 is slightly past the indicator. Breaker contacts firing the left bank open when piston No. 8 reaches a similar position. The engine fires at intervals of 60 and 120° corresponding to 30 and 60° of distributor travel. These intervals must be accurately set. This may be done by connecting a test lamp in each circuit and noting the exact moment the contacts separate. If small scratches are made on the distributor housing opposite the rotor when the contacts separate the firing intervals can be measured. The straight line distances between the marks should be $1\frac{1}{16}$ " for the 30° and $2\frac{1}{32}$ " for the 60° intervals.

Firing Order.—The firing order is 1, 8, 3, 6, 4, 5, 2, 7.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER GENERATOR.—Model 207. Starter cranks the engine at 100 R.P.M. Current required to break away is 265 amperes. While cranking starter draws 50-75 amperes. Rotation is clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 lb. ft.	Lock	3	—

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens 190-200° F., cuts in Res., reducing charging rate 50 per cent.

Generator Data—No. 207

Amperes	Cold	R.P.M.	Amperes	Hot	R.P.M.
0	—	575-600	0	—	750-800
8-10	—	1000	1-2	—	1000
16-18	—	1500	6-8	—	1500
18-20	—	2400	11-13	—	2400

To adjust the charging rate, loosen cover band and locknut on the generator commutator end and shift the third brush mounting plate by means of the handle. To increase the charging rate shift the third brush in the direction of armature rotation and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Every 1000 miles apply heavy grease to starting gear shaft through fitting in rear end of shaft and apply heavy oil to the generator clutch through oiler in top of housing. Once each year remove, disassemble and clean generator and motor clutches. Repack with vaseline.

RELAY.—There is no relay. The circuit between the battery and generator is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dash and tail lamps are 6-8 volts, 2 cp. Dimmer lamps is 6-8 volt, 2 cp. All are single contact.

FUSES.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25-30 amperes to start this device. While vibrating the current is 10-15 amperes.

Plate N . 838

HUFFMAN MODEL R (1921-22-23) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type SJWN-3, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018 to .024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service resurface contacts with fine emery cloth.

OILING.—Refill the grease cup under the breaker head and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. D-288. Starter is connected to the engine through a Bendix drive. When cranking engine, starter takes 130 amperes, armature revolving at 1500 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
10.0 lb. ft.	250	420	4.6
5.0 lb. ft.	850	250	5.3
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C-288. Generator current regulation is by third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature or 20-25 miles per hour.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
6		600	5		600
13		900	10		900
15		1200	12		1200
13.5		1600	11.5		1600
11.5		2000	10		2000

Shunt field current is 3.5 amperes at 6.5 volts. Charging rate is varied by adjustment of the third brush setting. Remove the leather plug in the commutator end of the generator, loosen the screw exposed and move in the direction of armature rotation to increase the charging rate. Move in the opposite direction to decrease the charging rate. Tighten the adjusting screw and replace the leather plug after adjustment is made.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 18 cp. Dimmer lamps are 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp.

MODELS 3-25 AND 3-35 (1922-1923) BIJUR GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

Plate No. 840

BATTERY.—Willard, Type SMW-7, 6 volts, 120 ampere-hours capacity. Starting capacity—90 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION.—Coils Model No. 2150. Distributor Model No. 5161. Breaker contacts separate .015 to .020 inch. To clean contacts, put a drop of oil on each pair while engine is in operation. Run the engine until the violent sparking caused by the oil ceases. Stop the engine and clean the contacts thoroughly with gasoline. If condition of breaker points affects ignition, remove and resurface on a medium hard oilstone.

OILING.—Put 8-10 drops of light engine oil in each of the ignition unit oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles. Once a season remove the top and lower plates at the rear of the distributor housing and repack with vaseline.

TIMING.—Breaker contacts on the right-hand side begin to separate when the flywheel marking "S.R." is at the indicator, spark control lever and breaker assembly in the fully advanced position. This is the firing position for No. 1 cylinder of the right-hand block. Breaker contacts on the left-hand side begin to separate when the flywheel marking "S.L." is at the indicator, spark control lever and breaker assembly in the fully advanced position. This is the firing position for No. 1 cylinder of the left-hand block.

FIRING ORDER.—The firing order is 1R, 6L, 4R, 3L, 2R, 5L, 6R, 1L, 3R, 4L, 5R, 2L. Spark Plugs.—Spark plug diameter is $\frac{7}{8}$ inch, gaps separate .030 inch.

STARTER.—Types ED-160, M-800, M-1041. The direction of rotation looking at commutator end is counter-clockwise. Starter is connected to engine by a Bijur automatic pinion shift. Motor running freely at 6800 R.P.M., taking 60 amperes, 5.8 volts. Cranking engine at 120 R.P.M., requiring 175-225 amperes, 5 volts. Lock torque—16.5 pound-feet, taking 665 amperes, 3.6 volts.

OILING.—Fill the starter oilers with light engine oil once a month.

GENERATOR.—Types K-646, M-718, M-718-A, M-1426. The direction of rotation is counter-clockwise, looking at commutator end. Generator regulation is by a vibrator-relay-regulator. The maximum charging rate is 15-18 amperes, decreasing to 4-6 amperes as battery becomes charged. The maximum charging rate is reached at 1000-1400 R.P.M. of armature or 20 miles per hour, car speed at high gears.

Generator Test Data

Amperes	R.P.M.
0	350
Max. 15-18	750

Generator motoring freely at 3-5 amperes, 6 volts. Field test—1.2-1.4 amperes, 7.75 volts, generator operating.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay and regulator are contained in an aluminum case, mounted on top of the generator frame. Adjustments are made through two holes in the side of the case. Relay closes at 8 miles per hour, or 450-500 R.P.M. of the armature, and opens at 7 miles per hour or 400-450 R.P.M. of the armature. Relay contact should close when the voltage of the generator reaches 6.5 volts. To adjust the relay remove the disconnecting plug and insert the adjusting wrench in the hole nearest the plug end and make a trial adjustment of the spring tension. Turn the wrench to the right to raise the cut-in voltage and to the left to decrease the cut-in voltage. Replace the plug and ascertain the result of the adjustment. Continue making trial adjustments in this manner until the desired relay action is obtained. Be sure that the disconnecting plug is always removed before inserting the wrench in the adjusting hole, or a direct short-circuit of the battery is liable to occur. Adjust the regulator in the same manner making trial adjustments with the plug removed until the specified action is obtained. To adjust the regulator, the generator must be driven at 1000-1400 R.P.M., charging a battery of 1.250 solution, or higher. The regulator must be adjusted to limit the voltage of the generator to 7.75 volts. Turn the adjusting nut to the right to raise the voltage and to the left to lower the voltage.

LAMPS.—Head lamps are 6-8 volt, 24 cp. Dimmer lamps are 6-8 volt, 6 cp. Instrument, inspection, side, tonneau, pillar, rear quarter and rear baggage compartment lamp are each 6-8 volt, 4 cp. Dome lamp is 6-8 volt, 12 cp., gas-filled. Tail lamp is 6-8 volt, 2 cp. All lamps have a single contact base.

FUSES.—Fuses are 10 ampere.

COLUMBIA
Light Six Model (1922-23)
Auto-Lite Generating, Starting and Lighting System
Auto-Lite Ignition

Plate No. 841

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

COLUMBIA LIGHT SIX MODEL (1922-23) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type CDX-311-X, 6 volt, 120 ampere-hour. Starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .018-.020 inch. The contact points are made of tungsten. If the condition of the contact points affects the ignition, remove and re-surface on a medium hard oilstone.

Oiling.—Fill the oiler at the side of the distributor housing with light engine oil once a month, or every 1000 miles. Put a few drops of oil on the breaker arm bearing every 3000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model MH-1019. Starter is connected to engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter running free at 4000 R.P.M., takes a current of 40-60 amperes at 6 volts. Cranking the engine at 125 R.P.M., takes a current of 150 amperes, 5 volts. Lock torque is 18 pound-feet, current being 600-650 amperes, 3-4 volts.

Starter Test Data

Torque	R.P.M.	Amperes
2 lbs. ft.	1160	110
4 lbs. ft.	880	170
6 lbs. ft.	700	225
8 lbs. ft.	580	275
10 lbs. ft.	460	325
12 lbs. ft.	375	365
17.5 lbs. ft.	Lock	600

Oiling.—Put 4 or 5 drops of light engine oil in each of starter bearings once in two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR.—Model GJ-1025V. The direction of rotation is counter-clockwise, looking at commutator end. Generator motoring freely at 6 volts, 4-5 amperes. Field test, current being 2.2 amperes, 6 volts. Each coil separately, 8.8 amperes, 6 volts. The third brush system is used for current regulation. To increase generator output move third brush in a counter-clockwise direction, to decrease, vice versa. The maximum charging rate is reached at 20-25 M.P.H., or 1600-1700 R.P.M. of armature.

Generator Test Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0.0		500	0.0		550
4.0		600	4.0		730
8.0		750	6.0		850
12.0		950	8.0		950
16.0		1400	12.0		1350
16.5		1600	12.6		1700
15.0		2400	11.6		2400
13.0		3000	10.6		3000

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers once every two weeks. If car is driven over 500 miles in two weeks, this attention must be given once to every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7-9 M.P.H., at 6.5 volts, and opens at 450-500 R.P.M. of armature, or 5-7 M.P.H., or 0-1 ampere discharge. The contact gap is .025-.030 inch. The air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Side lamps are 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp. All have single contact base, except dash lamp. Dash lamp is 6-8 volts, 2 cp., D.C.

COMBINATION SWITCH.—Briggs & Stratton Model No. 1927.

Plate No. 842

FRANKLIN

MODEL 10-A (1922-23)

NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEMS ATWATER-KENT IGNITION

BATTERY.—Willard, Type SJR-5, 6 volts, 132 ampere-hours. The starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 28 hours. The negative (—) terminal is grounded.

IGNITION.—Atwater-Kent, Type RA. Breaker contacts separate .015 inch, contacts fully separated. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. If car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Put a small amount of vaseline on the cam, applying with a toothpick every 1000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is one inch before top dead center, measured on the flywheel, on compression stroke. Spark control button pushed in, triangle work in for wheel to the right (generator side) of the center line work inside for wheel housing.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model K. The starter is connected to engine by chain. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 5000 R.P.M., takes a current of 50-60 amperes, at 6 volts. Starter cranking the engine at 125 R.P.M., takes a current of 125-200 amperes at 3-4 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every month. If car is driven over 1000 miles in a month, this attention must be given every 1000 miles.

GENERATOR.—Model LA-3938. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the output of the generator, loosen lock screw on end plate and turn adjusting screw in a clockwise direction. Motoring freely, the generator takes 4-6 amperes at 6 volts. Field current is 3-4 amperes at 6 volts.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	600	8
Max. 15-20	1600-1800	20
8-10	3000	

Oiling.—Put 4 or 5 drops of light engine oil in each generator oiler every two weeks. If car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 550-600 R.P.M., or 10-12 M.P.H., taking 6.5 volts. Relay opens at 500-550 R.P.M., or 8-10 M.P.H., or 0-2 amperes discharge. Contact gap is .025-.040 inch, and the air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Briggs & Stratton Switch used. Head lamps are 6-8 volts, 21 cp., S.C. Dimmer lamps are 6-8 volts, 4 cp., S.C. Speedometer lamp is 6-8 volts, 2 cp., S.C. Tail and instrument lamps are 3-4 volts, 2 cp., S.C. Dome lamp is 6-8 volts, 2 cp. S.C.

FUSES.—Generator fuse is 6 amperes. Primer fuse only is 115 amperes. All other fuses are 15 amperes.

Bijur Generating, Starting and Lighting System
Connecticut Ignition

Plate No. 844

PILOT

MODEL 6-50 (1921-23)

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM

CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volts, 90 ampere-hours capacity. The starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION.—The ignition is Connecticut Battery Ignition. The contact gaps are adjusted to .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Every 1000 miles remove the breaker box cover and put 4 or 5 drops of light engine oil around the distributor shaft. This will lubricate the lower bearing. Use care not to let oil reach the contact points.

Timing.—The breaker contact points begin to separate when piston No. 1 is slightly past top dead center, on power stroke, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, and the gaps are .030 inch.

STARTER.—Model M-1808. The starter is connected to the engine by a Bendix drive. The direction is clockwise, looking at commutator end. Starter running free at 6800 R.P.M., takes a current of 30 amperes, 5.8 volts. Cranks the engine at 125-150 R.P.M., requiring a current of 150-175 amperes, 5 volts. Lock torque is 16.5 pound-feet, the current being 665 amperes, 3.6 volts.

Oiling.—Place 4 or 5 drops of light engine oil in each starter oiler once a month. If the car is driven over 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model M-1807. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The third brush is adjusted through a ratchet engagement by the use of a special toothed wrench inserted in the adjusting hole at the commutator end of generator. Turn the wrench to the right to increase the charging rate, after first loosening the nut. The field test current is 4-6 amperes, 6 volts.

Generator Test Data

Amperes	R.P.M.
0	550- 600
12-16	1400-1600

Oiling.—Place 4 or 5 drops of light engine oil in each of the generator oilers once in two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—The relay closes at 550-600 R.P.M. of armature or 8-10 M.P.H., or 6.5 volts and opens at 500-550 R.P.M. of armature, or 6-8 M.P.H., 0-1 ampere discharge. The relay contact gap is .045 inch. The air gap between the relay armature and coil core is .035 inch, contacts closed. Relay tension spring is adjusted by a special wrench inserted in the relay adjusting hole at the commutator end of generator. Generator is connected to battery through ignition switch, when switch is turned on.

LIGHTING.—Connecticut Toggle Switch is used. Head lamps are 6-8 volts, 21 cp., S.C. Dash and tail lamps are 6-8 volts, 2 cp., S.C.

GRAY

MODEL N (1922-23)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—U. S. L., Type CDN-311-X, 6 volts, 84 ampere-hours. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION.—Type SC. Breaker contacts separate .012-.016 inch, fully separated. The are made of tungsten. If the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, this care must be done every 500 miles.

Timing.—Breaker contact points begin to separate when piston No. 1 is at top dead center entering on power stroke, spark control lever and breaker assembly fully retarded. Resistance of primary coil is 1 ohm. The distance from the distributor arm to carburetor bowl should not be less than $\frac{1}{4}$ of an inch.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Frame No. 33-AB. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator current of 35-45 amperes, 5.5 volts. Cranking the engine at 100-150 R.P.M., takes end of the motor. Motor running free at 4100-4700 R.P.M. of armature takes a current of 150-200 amperes, 5-5.5 volts. The lock torque is 12 pound-feet, the current being 474 amperes, 4 volts.

Oiling.—Place 4 or 5 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 34-ATL. The direction of rotation is counter-clockwise, looking at commutator end. The generator motoring freely takes 3-4 amperes at 6-6.3 volts. The shunt field current is 2.5-3.2 amperes, 6-6.3 volts. The third brush system is used for current regulation. To increase the generator output, loosen the screws on the rear end of generator bracket, and move the third brush in the direction of armature rotation (counter-clockwise). Move against the direction of rotation or in clockwise direction to decrease the charging rate.

Generator Test Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	650	6.5	0	600	6.5
8-11	1500	7.5	12-14	1400-1600	7.5
7-9	2500	7-7.5	9-11	2500	7.0-7.5

Oiling.—Place 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7 to 9 miles per hour, or 6-5 volts, and opens at 450-500 R.P.M. of armature, or 5 to 7 miles per hour, or 0-2 amperes discharge. Relay contacts separate .030 inch. The air gap between the relay armature and coil core is .012-.015 inch. The shunt coil resistance is 68 ohms.

LIGHTING.—Briggs & Stratton Combination Switch. Model No. 1735. Head lamps are 6-8 volts, 15 cp. Dash and tail lamps are 6-8 volts, 2 cp. All lamps have single contact base.

FUSES.—The generator fuse is 5 amperes. Lighting fuse is 20 amperes.

ANDERSON

MODEL 41 (1923)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volts, 111 ampere-hours capacity. The positive (+) terminal is grounded.

IGNITION.—Type SC. Coil Model No. 288,761. Distributor Model No. 303,018. Breaker contacts separate .011 to .015 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium oilstone.

Oiling.—Place 4 or 5 drops of light engine oil into the oiler on the outside of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—The breaker contacts begin to separate when the top dead center mark on the flywheel is one-half of an inch past indicator. The spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Frame No. 711. Model No. 355,708. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R.P.M., taking 145 amperes. Lock torque is 17 pound-feet, current being 525 amperes, 4.0 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
2.5 lb. ft.	1250	150	5.5
17.0 lb. ft.	0	525	4.0

Brush tension is 2.5 to 3.0 pounds.

Oiling.—Fill the oil cups with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No 36-AT1, Style No. 355,705. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is employed for current regulation. The maximum charging rate is 16 amperes, reached at 1450 R.P.M. of armature or 28 miles per hour, car speed in high gear.

Generator Test Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	625	6.5	0	475	6.5
7	950	6.6	8	750	8.0
11	1450	7.7	15-16	1450	8.0

The brush tension is 20-24 ounces.

Oiling.—Place 4 or 5 drops of light engine oil in the generator oil cups every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 302,210. Relay closes at 7.85 M.P.H., or 475 R.P.M. of armature, and opens at 6.7 M.P.H., or 405 R.P.M. The relay contacts separate .035 to .050 inch. The air gap between armature and coil core is .014 to .017 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volts, 21 cp. A dimmer resistance is used. Dash, tail and dome lamps are 6-8 volts, 2 cp.

FUSES.—Generator fuse is 5 amperes. Lighting fuse is 15 amperes.

CUNNINGHAM

MODEL V, SERIES 5 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

CUNNINGHAM
Model V, Series 5 (1923)
Delco System

Plate No. 847

BATTERY.—Willard, SJRN-5, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2135. Distributor Model No. 5218. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 5 or 6 drops of light engine oil in the ignition unit oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Once each year remove the grease plug on the side of the distributor housing and repack the housing with medium heavy cup grease.

TIMING:—Breaker contacts begin to separate when the piston entering power stroke is 5 deg. past top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plugs:—Spark plug gaps are $\frac{1}{8}$ inch. Gaps are .030 inch.

STARTER.—Model No. 183. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to engine by a Bendix drive. Starter running free at 4000 R.P.M. takes a current of 60-70 amperes, 5.5 volts. Cranking the engine at 150 R.P.M. requires a current of 125-200 amperes, 5 volts. Lock torque is 24 lb. ft., current being 450-550 amperes at 2.75 volts. The starter brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

OILING:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. 182. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band and loosen the lock nut on the end of the generator. Then turn the third brush plate adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock nut after making the adjustment. The maximum charging rate is 18 amperes, reached at 1000 R.P.M. of the armature or 24 miles per hour. Generator motoring freely takes 3-5 amperes at 6 volts. Field current is 2 amperes at 6 volts.

Generator Test Data (Hot Test)

Amperes	R.P.M.	M.P.H.
0	450	
10	800	
18	1000	24
10-14	1450	
13	1800	

The tension of each of the generator brushes should be from $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 400 R.P.M. of the armature, and opens at 8 miles per hour or 320 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltage of the generator reaches 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn N . 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamps are each 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

Plate No. 848

JORDAN **MODEL MX-H (1923)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY:—Willard, Type XR-15, 6 volt, 113 ampere hour capacity
The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model 5255. Breaker contact gap is .022 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a hard oilstone.

Oiling:—Place 8 or 10 drops of light engine oil in distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Repack distributor shaft housing with soft cup grease up to advance ring and yoke once each season.

Timing:—Breaker contact points begin to separate when No. 1 piston is $3\frac{3}{8}$ inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded; or 25° early, measured on the flywheel, with spark control lever and breaker fully advanced.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—The spark plug gaps are .025-.030 inch.

STARTER:—Starter Model No. 208. The direction of rotation is clockwise, looking at commutator end. Starter cranks engine at 800 R.P.M. of motor armature, or 120 R.P.M. of engine, taking a current of 85 amperes (hot) or 105 amperes (cold). Lock torque is 27 pound-feet at 2.75 volts. Starter running free draws 36 amperes at 6 volts. The brush tension of the starter brushes should be from $2\frac{1}{2}$ to $2\frac{3}{4}$ pounds each.

Oiling:—Repack once or twice a season with soft cup grease by means of the grease plugs on the side of the gear housing. Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. The wick under the oiler on the outward bearing of the splined shaft should be saturated with light engine oil every 2000 miles. The starting motor must be withdrawn from the engine for this purpose.

GENERATOR:—Model No. 256. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush is used for current regulation. The maximum charging rate is 15 amperes, reached at 15 miles per hour.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
5		700	6		700
11		1000	12		1000
14-16		1600	15-18		1600
15 Max.		1800	17 Max.		1800

Oiling:—Refill the two oil cups with light engine oil every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. Avoid lubricating in such amount that the oil would eventually foul the generator commutator, and perhaps interfere with the proper amount of current generated.

RELAY:—Model No. 5754. Relay closes at approximately 8 miles per hour, and opens at approximately 5 miles per hour. The contact gap is .025-.035 inch. The air gap between the relay armature coil core is .025-.035 inch, contacts closed.

LIGHTING:—Delco Combination Switch No. 1243 is used. Head lights are 6-8 volts, 21 cp. Auxiliary lights are 6-8 volts, 4 cp. Dash and tail lights are 6-8 volts, 2 cp.

CIRCUIT BREAKER:—A circuit breaker is used in the place of fuses. The circuit breaker is mounted on the back of the switch. In operation, the circuit breaker intermittently cuts off the flow of current and produces an audible clicking sound, giving warning of an abnormal condition in one of the lighting circuits. This action will continue until the ground is removed or the switch operated to cut off the circuit on which the ground exists. In this manner the circuit breaker protects the wiring, switch and storage battery. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to operate with a current flow of not more than 15 amperes. Length of plunger which changes the maximum break between contacts is normally .012-.030 inch. Air gap, totally, between the disc and the walls of the U-shaped frame is .019-.025 inch.

Plate No. 849

CHEVROLET

MODEL F. B. (1922)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 115 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. When condition of contacts affects the ignition, resurface with a very fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, using a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Contacts should begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 2, 4, 3.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model ME. Starter is connected to engine through a Bendix drive.

Starter Data		
Torque	R.P.M.	Amperes
1 lb. ft.	1960	80
3 lb. ft.	1100	160
5 lb. ft.	800	220
7 lb. ft.	500	280
9 lb. ft.	230	340
13 lb. ft.	Lock	470

OILING.—Starter bearings are packed with grease. Thoroughly clean out and repack starter bearings with soft cup or ball bearing grease every six months.

GENERATOR.—Model GH. Generator current regulation is by third brush system.

Amperes	Generator Data	R.P.M.
5.00		760-820
10.00		1020-1100
12.50		1200-1300
15.00		1460-1675
15-16		1950-2250

When generator is operating freely as a motor, current is 2.7 amperes, armature revolving at 450 R.P.M. Shunt field current is 1-7 amperes.

OILING.—Put 5 or 6 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 550-600 R.P.M. of armature and opens at 5-8 miles per hour or 450-500 R. P. M. of armature. Charging current is .5 to 1.5 amperes at closing and the discharge current 0-1 ampere at opening of relay. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 4 cp

FUSES.—Fuse is 20 ampere.

Plate N . 850

STUDEBAKER

MODEL EM (1923)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard Type SJRN-3.—6 volt 90 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 626-A. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking "MA-AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Starter Model No. 720-C. The starter is connected to the engine through a Bendix drive, S.A.E., barrel mounted. The direction of rotation is counter-clockwise looking at commutator end, the brush tension being 20-28 ounces.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0 lb. ft.	5	65	6000
15 lb. ft.	3.15	570	Lock

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

GENERATOR.—Model 917-A. Generator current regulation is by the third brush system. Thermostat opens at 195° to 200° F., cutting down the maximum charging rate to 11 amperes. The direction of rotation is counter-clockwise, looking at the commutator end.

Cold Test			Generator Data			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.1	850	6-9		1450			
18-20	8.3-8.8	1800	11	8.2	1900			
17-10		2500						

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Model No. 284-B. Relay closes at 8-10 miles per hour, and opens at 6-8 miles per hour. Air gaps between relay armature and coil core is .012 to .015 inch, contact points closed. Contact opens .012 to .015 inch. Adjust spring tension by bending brass strip through which spring passes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn N . 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp.S.C. Dash, tail and side lamps are each 6-8 volt, 2 cp.S.C. Dome, stop and corner lamps are each 6-8 volt, 4 cp.S.C.

FUSES.—Fuses are 10 ampere.

MODELS EK-EL (1923)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volts, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-A. Distributor Model No. 626-F. The breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or on a medium hard oilstone.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking UP-DC-1-6 is at the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model No. 723-A. Starter is connected to the engine through a chain drive and an overrunning clutch. The direction of rotation is clockwise, looking at the commutator end.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0	5	70	1000
70	3.25	600	Lock

The starter brush pressure should be 20-28 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles. Once each year remove the grease plug in the reduction gear case and repack with graphite cup grease. Every three months oil the starter clutch in the sprocket on the engine crankshaft with light engine oil through the oil hole on the forward side.

GENERATOR.—Model No. 917-E. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. A thermostat in the shunt field circuit cuts in a resistance that lowers the generator output approximately 50%.

Generator Data

Amperes	Cold Volts	R.P.M.	Amperes	Hot Volts	R.P.M.
0	Cut in	675			
7	7.1	850	6-9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 4 or 5 drops of light engine oil in each generator oiler every 1000 miles.

RELAY.—Model 263-F. Relay is mounted on the dash. Relay contacts close at 8-10 M.P.H. with a generator voltage of 7.2 volts and open at 6-8 M.P.H. with a discharge current of 0-2.5 volts. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. S. C. Dash, tail and side lamps are each 6-8 volt, 2 cp. S. C. Tonneau, stop and dome lamps are each 6-8 volt, 4 cp. S. C.

FUSES.—The fuses are 10 amperes

JEWETT

1923

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Willard, Type SW-4, 6 volt. The positive (+) terminal is grounded.

IGNITION.—Coil Type N-3. Distributor Type 2-A. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, gently scrape with a penknife or resurface on a hard oilstone.

Oiling.—Refill the distributor oiler with medium cylinder oil every 100 miles. Also place a small amount of vaseline on the breaker cam at the same time.

Timing.—Breaker contacts begin to separate when piston No. 1 entering firing stroke, and mark I.O.-1-6 is 1½ inches past indicator, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .020-.025 inch.

STARTER.—Model No. 713-A. Starter is connected to the engine by a Bendix drive. The direction of rotation, looking at commutator end, is counter-clockwise. Brush tension is 24-28 ounces.

Starter Test Data

R.P.M.	Torque	Amperes	Volts
5000	0 lbs. ft.	65	5.0
Lock	12 lbs. ft.	475	3.6

Oiling.—Fill oil cup on each end of starting motor with light cylinder oil every 500 miles.

GENERATOR.—Model No. 913-E. The direction of rotation, looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system and thermostat control. Maximum charging rate is 20 amperes, at 8.5 volts, at 1800 R.P.M. The field draws 5 amperes at 6 volts.

Generator Test Data

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
11	8.2	1900	0	—	675
			7	7.1	825
			20	8.5	1800

To adjust the charging rate, shift the third brush. Moving the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The brush tension should be 16 ounces on each brush.

Oiling.—Fill oil cup at each end of generator with light engine oil every two weeks. If car is driven more than 500 miles in two weeks this care must be given every 500 miles.

RELAY.—Model No. 266-A or 266-B. Relay closes at 6.9 volts or 675 R.P.M. of armature, and opens at 6 volts. Relay contacts separate .014 inch. Air gap between armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface on a hard oilstone.

LAMPS.—Head lamps are 6-8 volt, 21 cp., S.C. Dimmer lamps are 6-8 v lt, 4 cp., S.C. Tail lamp is 6-8 volt, 2 cp., S.C. Dash lamp is 6-8 volt, 2 cp., D.C. Dome lamp is 6-8 volt, 4 cp., D.C.

FUSES.—Generator field fuse is 5 ampere. Lighting circuit fuse is 20 amperes.

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Westinghouse, Type 6-WO-17, 6 volt, 155 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model N-7. Distributor Type RA. The breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and scrape with a penknife or resurface on a medium hard oilstone.

Oiling.—Fill oil cup under breaker head with light cylinder oil every two weeks. Apply a small amount of vaseline on the breaker cam once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is on power stroke, mark "IN-OP-6" on the flywheel is opposite the indicator. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark gaps are .020-.025 inch.

STARTER.—Model No. 722-A. The starter is connected to the engine through a set of reduction gears and Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is mounted by means of an S. A. E. barrel type mounting.

Starter Test Data

Volts	Amperes	R.P.M. (of Bendix)	Torque
5	70	2500	0 lb. ft.
3.15	570	Lock	28 lb. ft.

The brush tension is 20-28 ounces.

Oiling.—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR.—Model No. 923-A. The direction of rotation is clockwise, looking at commutator end. The current is regulated by means of a third brush and a thermostat. A fuse is mounted on the commutator end bearing. Generator is driven at 1.2 times engine speed. The field current is 4.5 amperes, 6 volts.

Generator Test Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.0-7.3	675			
19-21	8.3-8.8	1650			
10-16		2500	9-12	8.0-8.5	1800 Max.

Brush tension is 14-18 ounces

Oiling.—Fill oil cups at each end of the generator housing with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 266-A, 266-B and 263-C. Relay contacts separate .014 inch. The air gap between the relay armature and coil core is .014 inch. Relay contacts close at 550 R.P.M. of the generator armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head and signal lamps are 6-8 volts, 21 cp., S.C. Auxiliary head and dash lamps are 6-8 volts, 4 cp., S.C. Side and tail lamps are 6-8 volts, 2 cp., S.C. Trouble lamp is 6-8 volts, 4 cp., D.C.

FUSES.—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

Plate No. 854

DORT

MODELS 12, 12-C, 17, 17-S (1921)

GRAY & DAVIS GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

Timing.—Breaker contacts begin to separate when top dead center mark on flywheel is 1 inch past indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model No. 525. The starter is connected to engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Cranks engine at 100-150 R.P.M., taking a current of 100-150 amperes, at 5-5.5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
35.....	6.0.....	0.....	5000
450.....	3.5.....	12 lb. ft.....	Lock

Oiling.—Put 4 or 5 drops of light engine oil in each of starter bearing oilers every month.

GENERATOR.—Model No. 636. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, turn pinion screw found between fuses and relay on commutator end plate. To increase the charging rate, turn pinion screw in a clockwise direction (opposite of armature rotation). To decrease the charging rate, turn pinion screw in counter-clockwise direction (direction of armature rotation).

Generator Test Data

Amperes	R.P.M.	M.P.H.
0.....	450.....	
5.....	600.....	
10.....	825.....	
15 (Max.).....	1400.....	18-20
12.....	2500.....	

Generator motoring freely takes a current of 3-5 amperes, at 6 volts. The field test draws a current of 2.6 amperes at 6 volts.

RELAY.—Relay closes at 8-10 miles per hour or 500-550 R.P.M. of armature, and opens at 6-8 miles per hour, or 450-500 R.P.M. of armature. Charging current is 1 to 2 amperes at closing, and the discharge current 0 to 2 amperes at opening of relay. Air gap between relay armature (moving member) and coil core is .012-.015 inch, contacts fully closed. Contact gap is .015-.018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before placing the same into service.

LAMPS.—Head lamps are 6-8 volt, 16 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 ampere. Lighting fuses are 10 ampere.

Model 77-B
Plate No. 855A

Continued on next page.

TEAGLE MAGNETO

MODELS 50, 60, 66, 77, 77-B AND 77-V

Continued from preceding page.

ROTATION.—The Teagle Magneto is made to rotate in a clockwise direction only, when facing driving end of the magneto.

BREAKER.—The breaker points separate .015 inch. To adjust contact gap, first revolve cam until breaker arm is fully lifted or until contact is fully separated, then loosen the lock nut on breaker arm, turn the screw down until the breaker gap is fully closed. Now turn back the breaker screw one-half turn and this will give breaker opening of exactly .015 inch. If condition of the contact points affects the ignition, remove and resurface with a special magneto file. Do not file off any more than is necessary to clean points. Emery cloth should not be used to dress down or clean the points. The breaker arm should be in perfect alignment, and if it is necessary to bend the arm to procure perfect alignment, use tool No. 999 (bending tool used by the Teagle Co., of Cleveland, O.).

TIMING.—Turn the engine over until piston No. 1 is at top dead center on compression stroke, advance lever of magneto set at fully retarded (advance lever moved in clockwise direction as far as it will go) position. Remove the distributor cover and breaker cover from magneto and turn magneto shaft in the direction of rotation until brass distributor segment is just approaching the lower left hand section when facing the distributor. Rotate magneto shaft very slowly until breaker points just begin to separate. A convenient way of determining this exactly is to place a piece of thin tissue paper between the points and notice the exact point at which the pressure on the paper is released. If the specifications of the engine manufacturer call for a magneto setting other than full retard at top dead center, the magneto should be timed according to the manufacturer's specifications.

OILING.—Fill oilers on both ends of the magneto with light engine oil at least every 1000 hours of running. No oil should be used on the interrupter or breaker, as oil will foul points and prevent good contact, cause sparking, burning and misfires. Care should be exercised to prevent oil from entering the breaker housing.

RICKENBACKER

MODEL B. (1923)

BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM BOSCH IGNITION.

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 108 ampere-hour capacity. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. TC-30. Distributor No. T-6148. Breaker contacts separate .020 inch. If the condition of the contact points affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill oil cup on distributor housing every two weeks. Place a few drops of light engine oil on the interrupter lever every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline on breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is one quarter of an inch before reaching top dead center on compression stroke, breaker assembly and spark control lever fully advanced.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are 7/8 inch, gaps are .022-.025 inch.

STARTER.—Model No. 933 CWDE. The direction of rotation is counter-clockwise looking at commutator end. The starter is connected to the engine by means of a manually operated shift equipped with an overrunning clutch. The starter cranks the engine at 150 R.P.M., taking 125-150 amperes at 6 volts. Brush tension is 2 3/4-3 1/2 pounds.

Starter Test Data

Torque	R.P.M.	Volts	Amperes
0	2500	6	70
12	(0) Lock	4	500

Oiling.—Fill oil cups with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model No. 1032. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is employed for current regulation. To increase the out-put, loosen the hexagon nut inside of generator or third brush housing and move brush in counter-clockwise direction; to decrease charging rate, move in clockwise direction. Maximum charging rate is 15 amperes, reached at 1600 R.P.M. or 20 M.P.H., car speed in high gear.

Generator Test Data.

Cold Test. (20°C)			Hot Test. (85°C)		
0	6.5	600	0	6.4	600
5	6.75	700	7	7	1000
10	7.2	1000	9	7.2	1300
12	7.4	1200	8-10	7.4	1650
14-15	7.5	1600	8.6	7.4	2400
11.5	7.4	2400			

The brush tension should be 2 1/4 to 2 3/4 pounds each.

Oiling.—Fill oil cups with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 1032-CWDE. Relay closes at 7.5 M.P.H. or 600 R.P.M. of armature at 6.5-7.0 volts and opens at 450 R.P.M. or 5-6 M.P.H. or 0-2 amperes discharge. The contact gap is .015-.020 inch. Air gap between relay armature and coil core is .010 inch.

LIGHTING.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash, tail, and curb lamps are 6-8 volts, 2 cp. Stop light is 6-8 volts, 15 cp. All above lamps have single contact base.

Basco No. 2276 switch is used.

FUSES.—Two 20 ampere fuses are used.

OLDSMOBILE

LIGHT EIGHT, MODEL 47 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SR-4, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5210. The breaker contacts separate .020 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or ten drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack distributor housing with medium soft cup grease once each season up to advance ring and yoke. Apply a very small amount of vaseline on breaker cam every 2000 miles.

Timing.—Breaker contact begins to separate when piston No. 1 is at top dead center mark 1-4 on flywheel is at dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plugs.—Spark plug gaps are .030 inch.

STARTER.—Model No. 219. The direction of rotation is clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive. Cranking engine, it takes a current of 125-200 amperes at 5 volts.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4500	40-50	5.5
16 lb. ft.	0 (Lock)	450-550	3-4

Oiling.—Put 8 or 10 drops of light engine oil into starter oilers every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model No. 148. The direction of rotation is counter-clockwise, looking at commutator end. The third brush is used for current regulation. To increase the charging rate of the generator, move the third brush in a counter-clockwise direction; to decrease output, move the third brush in a clockwise direction. The maximum charging rate is 19 amperes. The shunt field current is 2 amperes at 6 volts.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	550	—
10	900	—
17-19 (Max.)	1400	20
13-17	1800	—

Oiling.—Put 8 or 10 drops of light engine oil into generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—No relay is used on this car. The generator is connected to battery directly through a combination switch, when the switch is turned on.

LIGHTING.—Delco Combination Switch No. 1198 is used. Head lights are 6-8 volts, 15 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash, tail and cowl lamps are 6-8 volts, 2 cp. All lights have single contact base.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to vibrate with a current flow of 25-30 amperes. It will continue to vibrate with a current flow not exceeding 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit-breaker terminals.

Delco Ignition

Plate No. 859

OLDSMOBILE

MODEL 43-A (1923)

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SR-4, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 260. (Generator-Distributor.) Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Repack the distributor shaft housing up to the advance ring and yoke with medium soft cup grease once a season. Apply a very small amount of vaseline to the surface of the cam breaker each 2000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, entering power stroke, spark control lever and breaker assembly fully retarded. To adjust timing of distributor, loosen screw in the center of shaft, place breaker cam in position so that when back lash in the distributor gears is rocked forward, the contacts will be opened by the breaker cam, and when the back lash in the gears is rocked backward the contacts will just close.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, gaps are .030 inch.

STARTER.—Model No. 261. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive. Cranking the engine at 125 R.P.M. taking a current of 125-200 amperes, 5 volts.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0	4000	40-50	5.5
10-12 lb. ft.	0 (Lock)	400-450	3-4

Oiling.—Put 8 or 10 drops of light engine oil into starter oilers every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Generator-Distributor Model No. 260. The direction of rotation is counter-clockwise, looking at commutator end. Third brush system is used for current regulation. To increase the charging rate, adjust third brush in a counter-clockwise direction, by first loosening the two screws holding the third brush arm. The generator motoring freely takes a current of 3-5 amperes at 6 volts. The shunt field current is 2 amperes at 6 volts. The maximum charging rate is 18 amperes reached at 1400 R. P. M. of armature or 20 M.P.H. of car speed in high gear.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	500	7
11-13	900	
16-18 (Max.)	1400	20
14-16	2000	

Oiling.—Put 8 or 10 drops of light engine oil into generator oilers every two weeks. If the car is driven more than 500 miles in two weeks this care must be given every 500 miles.

RELAY.—There is no relay used as the generator is connected directly to the battery through the switch, when the ignition is turned on.

LIGHTING.—Delco Combination Switch, Model No. 1245 is used. Head lights are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 5 cp. Dash and tail lamps are 6-8 volts, 2 cp. All lamps have single contact base except the dash lamp which has a double contact base.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. Circuit breaker begins to operate with a current of 25-30 amperes and continues to vibrate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with dead short circuit across the circuit breaker terminals.

DODGE

1923

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM DODGE-NORTH-EAST IGNITION

BATTERY.—Willard, Type SJR-26, also Exide, 12 volt, 51.4 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Type 10,205. Distributor Model O, Type 10,004. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Force grease into distributor by means of a grease nipple, using a pressure feed grease gun once every month or 2000 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER-GENERATOR.—Model GA, Type 3804. The direction of rotation is counter-clockwise, looking at the commutator end. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as permit 1/2 inch up-and-down play midway between the sprockets.

Starter Data.

Torque	R.P.M.	Amperes
6 lb. ft.	460	49
10 lb. ft.	350	78
13 lb. ft.	295	95
16 lb. ft.	233	116
35 lb. ft.	Lock	225

GENERATOR.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0	1000	0.0	900		
5.0	1200	5.5	1100		
7.0	1200	8.0	1200		
8.0	1800	9.0	1800		
6.0	3400	7.0	3800		

Charging rate is varied by adjusting the third brush. The position of the brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate, and in counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes. Main and third brush tension is 1-1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every 2000 miles.

RELAY.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R.P.M. of armature, and opens at 8 1/2 miles per hour, or 900 R.P.M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volts, 21 cp. Dash and tail lamps are each 12-16 volts, 2 cp. Dome lamp is 12-16 volts, 4 cp. All lamps have single contact base.

FUSES.—Field fuse, mounted on generator frame, is 10 amperes.

Plate No. 861

WINTON MODEL 40 (1922-23) DELCO GENERATING, STARTING, AND LIGHTING SYSTEM. DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 6 volts, 125 ampere-hour capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5208. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oil-stone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor shaft housing once a season with medium soft cup grease up to the advance ring and yoke.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug.—The spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER.—Model Nos. 209 and 244. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine through a Bendix Drive. It cranks the engine at 100 R.P.M. of armature.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0	3400	45	6
16 lb.-ft.	0	575	4

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model Nos. 210 and 243. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, remove brush band and loosen the three clamping screws passing through generator housing into brush plate, and move the third brush in a counter-clockwise direction. To decrease charging rate move the third brush in a clockwise direction. The maximum charging rate is 18 amperes, reached at 20 M.P.H. of car speed in high gear. Motoring freely generator takes a current of 3-5 amperes at 6 volts. The shunt field current is 2 amperes at 6 volts.

Generator Test Data

Amperes	M.P.H.
0	8
18 Max.	20

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-10 M.P.H. or 500-550 R.P.M. at 6.5 volts, and opens at 6-8 M.P.H. or 450-500 R.P.M. with a current discharge of 0-2 amperes.

LIGHTING.—Combination Switch Model No. 1247 is used. Head lights are 6-8 volts, 21 cp. Dimmer and dome lamps are 6-8 volts, 4 cp. Dash and tail lamps are 6-8 volts, 2 cp. All lamps have single contact base.

CIRCUIT BREAKER.—A circuit breaker is used to take the place of fuses. It is mounted on the back of the switch. Circuit breaker begins to operate when a current of 25-30 amperes, and will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

Plate No. 862

STANLEY STEAMER

MODEL 740 (1923). SERIAL No. 23001 AND UP. BIJUR GENERATING SYSTEM.

BATTERY:—Westinghouse 6-C-13 6 volts, 100 ampere-hours capacity. The negative (—) terminal is grounded.

GENERATOR:—Model No. L-220, & M.-1802. The direction of rotation is clockwise, looking at commutator end. The third brush system is employed for voltage regulation. To increase charging rate, move third brush in a clockwise direction; to decrease the generator output move third brush in the opposite direction. The maximum out put of the generator is 14 amperes reached at 1300 R. P. M. of armature when the generator is cold, and 13 amperes when hot.

Generator Test Data

Hot Test		Cold Test	
Amperes	R. P. M.	Amperes	R. P. M.
0.....	425.	0.....	390
8.....	700	8.....	630

9.....	2200	9.....	2100
8.....	3200	8.....	3200

Brush tension is 18 ounces.

Oiling:— Put 4 or 5 drops of light engine oil into each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Model No. Z-7. Relay closes at 6.5 volts, and opens at 1-2 amperes, discharge. Relay contacts separate .020 inch. The air gap between relay armature and coil core is .015 inch, contacts fully closed.

LIGHTING:— All lamps are 6-8 volts.

FUSES:— Fuses are 20 amperes.

BAY STATE

MODEL 1 (1922), SERIES NO. 106 AND UP. DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 105 ampere-hours capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. The breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor shaft housing with medium soft grease up to the advance ring and yoke each season.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated on flywheel by the mark "UD," spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, gaps are .027 inch.

STARTER.—Model No. 181. The direction of rotation is clockwise, looking at commutator end. The starter is connected to the engine through a Bendix drive. Cranks the engine at 5.0 volts, taking a current of 125-200 amperes.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4000	40-50	5.75
16 lb. ft.	0	450-500	3.4

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model No. 165. The direction of rotation is counter-clockwise, looking at commutator end. The third brush is used for current regulation. To increase the charging rate, loosen the three adjusting screws and move the plate at the end of the generator. Shift the same in the direction indicated by arrow. Generator motoring freely takes a current of 3.5-4.5 amperes, 6 volts. The shunt field takes a current of 2.5 amperes, at 6 volts.

Amperes	R.P.M.	M.P.R.
8	1000	—
0	650	—
4	800	—
12-16 (Max.)	1600	20
8-12	2300	—

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—The relay closes at 600-650 R.P.M. or 6-8 M.P.H. at 7-8 volts. Relay opens at 550-600 R.P.M. with a current discharge of 0.3 amperes. The relay gap separates .046-.072 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Combination Switch Model No. 1199 is used. Head lamps are 6-8 volts, 21 cp., S.C. Auxiliary, dash and tail lamps are each 6-8 volts, 2 cp., S.C. The dome light is 6-8 volts, 2 cp., D.C.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker begins to operate with a current flow of 25-30 amperes, and will continue to operate with a current flow of not less than 15 amperes.

BAY STATE

1923

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 105 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. The breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated on flywheel by marks "UD," spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, gaps are .027 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Cranking engine, starter takes 125-200 amperes at 5 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4000	36	6
27 "	Lock	450.500	2.75

The pressure of the starter brushes on the commutator should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Saturate the wick in the oiler at the end of the Bendix gear case with light engine oil once each year. Every six months remove the plug in the reduction gear case and inject medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, remove the cover band and shift the third brush mounting plate by means of an extension handle on the third brush. The plate is held in any position desired by means of friction clamp washers. The maximum charging rate is 16 amperes, reached at 1600 R.P.M.

Generator Test Data

Amperes	R.P.M.
4	800
8	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-10 M.P.H. or at 6.75-7.5 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, and the air gap between the relay armature and coil core is .010-.015 inch, contacts fully closed.

LIGHTING.—Combination Switch Model No. 1245 is used. Head lights are 6-8 volts, 21 cp., S.C. Dome light is 6-8 volts, 2 cp., D.C. Dimmer, tail and cowl lights are each 3-4 volts, 2 cp., S.C.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current flow of 25-30 amperes, and will continue to function with a current flow of not more than 15 amperes.

HUDSON

SUPER SIX MODEL (1922)

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 106 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. TC-Ed. 4. ..Compensating Timer-Distributor Model No. TC-6100. The direction of rotation of the distributor is clockwise, looking from top of distributor. The coil is mounted on the engine side of the dash and is dust and waterproof. It carries the "Ballast Coil" which prevents the battery from discharging if the ignition switch is accidentally left in the "ON" position. The timer-distributor is mounted on the right side of engine on top of the pump and timer bracket. Contacts are made of tungsten and should separate .020 inch. Surface is flat. When the condition of the contact points affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. If the contact points are excessively worn replace the points.

Oiling.—Fill distributor oiler on the side of the distributor housing with light engine oil. Put one drop of oil (less rather than more) on the interrupter lever pivot. Place a bit of grease or vaseline about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. Follow closely the above lubrication directions every month. If the car is driven more than 1000 miles in a month, care must be given every 1000 miles.

Timing.—Breaker contact points begins to separate when the flywheel marking is opposite the indicator on flywheel case with No. 1 piston on the compression stroke, and spark control lever and breaker assembly fully advanced. To adjust timing, place spark control lever in fully advanced position, loosen clamping screw on timer arm and turn the distributor housing opposite to direction of rotation of the rotor shaft until points just open. Tighten the clamping screw, being careful not to disturb the relative position of the timing arm and housing.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plugs diameters are of the metric scale, gaps are .030 inch.

STARTER.—Model No. 926. The starter is a four pole, series wound motor. Starting mechanism, which is operated by foot pedal, carries an over-running clutch. See that motor connections are tight and clean. Keep commutator clean wiping it off with a clean cloth slightly moistened with gasoline. Wipe dry before operating. Motor takes 125-200 amperes to crank engine at 150 R.P.M. The direction of rotation is counter-clockwise, looking at commutator end.

Starter Test Data.

GENERATOR.—Model No. 1217. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The charging rate is varied by loosening the screws on the commutator end plate and moving the third brush in the direction of rotation (counter-clockwise) to increase the out-put, and the reverse direction to decrease the charging rate. The maximum charging rate is 14-15 amperes at 8 volts, reached at 1100 R.P.M. of generator armature. See that the commutator is not dirty or pitted. Clean commutator by holding a piece of cloth slightly moistened with gasoline against it. Wipe dry before operating. If the commutator is rough or slightly pitted, smooth it by using No. 00 sandpaper. Brush contact surface must conform to the curvature of the armature.

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

R.P.M.	600	1200	1600	2000	3000
Amperes	2.9	2.1	1.6	1.3	0.7

Oiling.—Put 4 or 5 drops of light engine oil into each of the generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 6.5-7.5 volts, and opens at 0-2 amperes discharge. Relay contacts separate .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts closed. The relay is mounted on top of the generator frame and is enclosed within a metal case. To adjust relay connect ammeter in series with battery and gradually slow down generator. The contacts should open at the limits given above. Adjust by loosening or tightening the adjusting screws on the side of the relay. Be sure to resolder the screw after adjustment so as to eliminate the possibility of the screw becoming loose and changing the tension. Clean the contacts by drawing fine sandpaper between them.

LIGHTING.—Type S-106 Switch is used. The switch is mounted on the dash and is supplied with two faced levers one for controlling the lighting system and the other for operating the ignition system. The terminals on the back of the switch are marked for proper connections wires. Head lights are 6-8 volts, 21 cp., S.C. Side lamps are 6-8 volts, 2 cp., S.C. Dash and tail lights are connected in series. They are each 3-4 volts, 2 cp., D.C. and S.C. respectively.

FUSES.—Generator fuse is 5 amperes. All lighting and other fuses are 10 amperes.

(Concluded From Page 866)

GENERATOR.—Type 1217. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The charging rate is varied by loosening the screws on the commutator end plate and moving the third brush in the direction of rotation (counter-clockwise) to increase the output; and against the direction of rotation (clockwise) to decrease the charging rate. The maximum charging rate is 14-15 amperes at 8 volts, reached at 1100 R.P.M. of armature.

R.P.M.....	600	1200	1600	2000	3000
Amperes.....	2.9	2.1	1.6	1.3	0.7

Oiling.—See that the commutator is not dirty or pitted. Clean by holding a piece of clean cloth, slightly moistened with gasoline, against it. Wipe dry before operating. If the commutator is rough or slightly pitted, smooth it by using fine (No. 00) sandpaper. Brush surface must conform to the curvature of the armature. Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—The relay is mounted on top of the generator frame and is enclosed in a metal case. The contact gap separates .015 inch, and the air gap between relay armature and coil core is .010 inch. To adjust the relay for the proper cut in current, connect a voltmeter across the main brushes and gradually speed up the generator. Observe the voltmeter reading when contact is closed; it should read 6.5-7.5 volts. The points should open at 0-2 amperes discharge. Connect an ammeter in series with battery and gradually slow generator down. The contacts should open at the readings given above. Adjust by loosening or tightening the adjusting screw on the side of the relay. Be sure to resolder the screw after an adjustment, so as to eliminate the possibility of the screw becoming loose and changing the tension. Clean the contacts by drawing fine sandpaper between them.

LIGHTING.—Combination Switch Type S-106 is used. The switch is supplied with two face levers; one for the controlling of the lighting system and the other for operating the ignition system. The terminals on the back of the switch are marked for proper connection of wires. Head lights are 6-8 volts, 21 cp., S.C. Dimmer lamps are 6-8 volts, 4 cp., S.C. Tail and dash lamps are 3-4 volts, 2 cp., S.C.

FUSES.—Fuse Box Type FB-10 is used. It is mounted on the engine side of the dash and carries all fuses in connection with the system, except the generator fuse. Two spare fuses are supplied. All fuses are 10 amperes, and the generator fuse is 5 amperes. Generator fuse is mounted on top of generator.

CHALMERS

MODELS 35-B & 35-C (1923)

35-B, SERIAL NOS. 21001 AND UP, 35-C, SERIAL NOS. 125501 AND UP
AUTO-LITE GENERATING, STARTING, AND LIGHTING SYSTEM
AUTO-LITE IGNITION.

BATTERY.—U. S. L. Type 3-CVX-6X. 6 volts, 106 ampere-hour capacity. The starting capacity is 115.5 amperes for 20 minutes. The lighting capacity is 5 amperes for 21.5 hours. The negative (—) terminal is grounded.

IGNITION.—Type IG. Coil IG. 4031. Breaker contacts separates .015-.020 inch. They are made of tungsten. If the condition of the contact points affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill distributor oiler with light engine oil once a week. If the car is driven more than 250 miles in a week, this care must be given every 250 miles.

Timing.—Breaker contacts begin to separate when No. 1 piston on compression stroke is $1 \frac{21}{32}$ inch past top dead center, measured on flywheel, with marking "1:6 D. C." past the indicator, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Model MN. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive. Starter cranks the engine at 400 R.P.M. taking a current of 200 amperes at 5 volts.

Starter Test Data.

Torque	Amperes	Volts	R.P.M.
0	60	5.5	4000
18 lb.-ft.	600	4	0 (Lock)

Oiling.—Fill starter oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model GJ. The direction of rotation is counter-clockwise, looking at commutator end. The third brush is used for current regulation. To increase the charging rate loosen the nut inside of the generator holding the third brush and move the brush in the direction of rotation (counter-clockwise) and to decrease the charging rate, move the third brush in a clockwise direction. The generator motoring freely takes a current of 6 amperes at 6.3 volts. The shunt field current is 2 amperes at 6.3 volts. The maximum charging rate is 16 amperes, reached at 1500 R.P.M. of armature.

Generator Test Data

Amperes	Cold Test	
	R.P.M.	Volts
1	600	6.5
8	800	7.6
16 Max.	1500	8.3
10	4500	8.1

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 550 R.P.M. of armature, or 7-9 M.P.H. at 6-8 volts and opens at 500 R.P.M. of armature or 5-7 M.P.H. with a current of 1 ampere discharge. The contact gap is .025-.035 inch and the air gap between relay armature and coil core is .010-.015 inch.

LIGHTING.—Briggs & Stratton combination switch is used. Head lights are 6-8 volts, 21 cp. S. C. Dimmer, dash and tail lights are each 6-8 volts, 2 cp. S. C.

FUSES.—The main fuse is 20 amperes, and the auxiliary fuses are 10 amperes.

CHANDLER

(1923)

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes, and the lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model FI-635. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contacts affect the ignition, remove and resurface on a medium hard oilstone. If excessively worn, replace the points.

Oiling.—Fill oiler on the side of the distributor housing with light engine oil. Put one drop of light engine oil (less rather than more) on the interrupter lever pivot. Place a bit of hard grease about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. The above lubricating instructions must be followed every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

Timing.—Breaker points just begin to separate when piston No. 1 is on compression stroke, two teeth past top dead center measured on flywheel or two teeth past indicator mark (1:6), spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inches, and the gaps are .020 inch.

STARTER.—Model 935. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine through a Bendix drive. Cranks the engine at 100-150 R.P.M. taking a current of 150 amperes, at 5-5½ volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0	4000	35-40	6
12 lb. ft.	Lock	450	3-4

Oiling.—Put 4 or 5 drops of light engine oil into each oiler of the starter every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model No. 1001. The generator is a 4 inch, 4 pole, 6 volt, shunt wound machine, equipped with ball bearings. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is employed for current regulation. To increase the charging rate turn screw located on the commutator end of the generator. Move the third brush in a counter-clockwise direction to increase the charging rate, and decrease the out-put by moving the third brush in a clockwise direction. The maximum charging rate is 13-14 amperes, at 7.5 volts, reached at 1500-1600 R.P.M. of armature. To make this adjustment, the generator should be at 50°-80° F. at frame, (generator cold) and battery must be fully charged. See that the commutator is not oily or dirty; clean by wiping off with a clean cloth slightly moistened with gasoline. Be sure to wipe dry before operating the generator. The brush tension is 1¾-2¼ pounds.

Generator Test Data

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

American Bosch Generating, Starting, and Lighting System
American Bosch Ignition

Plate No. 869

Plate No. 870

CLEVELAND

MODEL 41 (1922). SERIAL NOS. UNDER 50,000
AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM
AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6190. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill the oil cup on the side of the distributor housing with light engine oil. Put one drop of light engine oil on the lever pivot post and place a bit of hard grease on the side of the interrupter block nearest to post. The above instructions must be followed every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—To time the ignition, turn the engine over until the flywheel marking "DC 1&6" is directly under the notch cast in the crankcase over the flywheel, with the spark control lever and breaker assembly in the fully retarded position. The breaker contacts should then just begin to separate.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .021 inch.

STARTER.—Model No. 900. Direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., taking 150 amperes. Running free, the current is 45-50 amperes.

Starter Data.—No. 900

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of the brushes on the commutator is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Model No. 1021. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate; moving the brush in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes, reached at 1500-1600 R.P.M. of armature or 20 M.P.H., car speed in high gear. When making adjustment of generator, the generator should be cold (50°-80° F. at frame) and battery fully charged. The pressure of all brushes is 1 3/4 to 2 1/4 pounds.

10.0	6.9	2800	7.7	6.6	2800
8.3	6.0	3200	6.0	5.6	3200

Frame temperature—Cold, 20°C.; hot, 85°C.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0-2 amperes. The contacts separate .012 to .014 inch. The air gap between the coil core and the relay armature is .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 000 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dash, tail and side lamps are 6-8 volts, 2 cp. With dimmer resistance, head lamps are approximately 2 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

Model 42 (1923)
American Bosch Generating, Starting and Lighting System
American Bosch Ignition

Plate No. 871.

CLEVELAND

MODEL 42 (1923). SERIAL NOS. 50,001 UP
AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM
AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6190. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill the oil cup on the side of the distributor housing with light engine oil. Put one drop of light engine oil on the lever pivot post and place a bit of hard grease on the side of the interrupter block nearest to post. The above instructions must be followed every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—To time ignition, turn the engine over until the flywheel marking "DC 1&6" is directly under the notch cast in the crankcase over the flywheel. Then rotate the flywheel to the right or in a clockwise direction until a point $3\frac{1}{2}$ teeth before dead center is under the notch. With the spark control lever and breaker assembly fully advanced, the breaker contacts should just begin to separate at this point.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .021 inch.

STARTER.—Model No. 900. Direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., taking 150 amperes. Running free, the current is 45-50 amperes.

Starter Data.—No. 900

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of the brushes on the commutator is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.

GENERATOR.—Model No. 1021. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate; moving the brush in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes, reached at 1500-1600 R.P.M. of armature or 20 M.P.H., car speed in high gear. When making adjustment of generator, the generator should be cold (50°-80° F. at frame) and battery fully charged. The pressure of all brushes is $1\frac{3}{4}$ to $2\frac{1}{4}$ pounds.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dash, tail and side lamps are 6-8 volts, 2 cp. With dimmer resistance, head lamps are approximately 2 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

DAVIS

MODELS 71-76 (1922-23) 6-Y CONTINENTAL ENGINE DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-3, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Ignition Coil Model No. 2159. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline or soft cup grease to the surface of the breaker cam each 2000 miles. Apply a very small amount of vaseline to rotor track in distributor occasionally during the first 2000 miles. The track will then become glazed and no further lubrication is required. It is only necessary to keep the track wiped with a clean cloth. Repack distributor housing with soft cup grease up to the advance ring and yoke once every season.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated by marking "UD" on the flywheel, at indicator on flywheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug.—The spark plug diameters are 7/8 inch, and the spark plug gaps are .025-.030 inch.

STARTER.—Motor Model No. 240. The starter is connected to the engine by a Bendix Drive. The direction of rotation is counter-clockwise, looking at commutator end. Lock torque is 15 pounds-feet, taking a current of 450-550 amperes, at 3-4 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. Saturate the wick in the oiler on the Bendix gear case with light engine oil once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice each year.

GENERATOR.—Model No. 241. The direction of rotation is counter-clockwise, looking at commutator end. The maximum charging rate is 14-16 amperes reached at 1600 R.P.M. of armature. The third brush system is used for current regulation. To adjust the output of the generator, remove the cover band over the generator brushes. Loosen one or two turns of the three clamping screws located on the brush plate and move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and move third brush in the opposite (clockwise) direction to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
5.....	700
11.....	1000
14-16 (Max).....	1600
15.....	1800

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contact closes at 7-8 volts, or 8-10 M.P.H. and opens at 6-7 M.P.H. with a discharge of three amperes. Contact gap is .025-.035 inch, and the air gap between relay armature and coil core is .025-.035 inch.

LIGHTING.—Delco Combination Switch No. 1172 is used. Head lights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2cp. All lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to vibrate with a current flow of 25-30 amperes. It will continue to vibrate with a current flow not exceeding 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit-breaker terminals.

Plate No. 873

BATTERY.—Willard, Type SJR-3, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Ignition Coil Model No. 2178. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline or soft cup grease to the surface of the breaker cam each 2000 miles. Apply a very small amount of vaseline to rotor track in distributor occasionally during the first 2000 miles. The track will then become glazed and no further lubrication is required. It is only necessary to keep the track wiped with a clean cloth. Repack distributor housing with soft cup grease up to the advance ring and yoke once every season.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated by marking "UD" on the flywheel, at indicator on flywheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug.—The spark plug diameters are 7/8 inch, and the spark plug gaps are .025-.030 inch.

STARTER.—Motor Model No. 240. The starter is connected to the engine by a Bendix Drive. The direction of rotation is counter-clockwise, looking at commutator end. Lock torque is 15 pounds-feet, taking a current of 450-550 amperes, at 3-4 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. Saturate the wick in the oiler on the Bendix gear case with light engine oil once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice each year.

GENERATOR.—Model No. 257. The direction of rotation is counter-clockwise, looking at commutator end. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature. The third brush system is used for current regulation.

Amperes	R.P.M.
5	700
11	1000
14-16 (Max)	1600
15	1800

To adjust the charging rate, remove the cover band and move the third brush mounting plate by means of an extension handle. Shift the third brush in a counter-clockwise direction (direction of rotation) to increase the charging rate, and in the opposite (clockwise) direction to decrease the charging rate. The plate can be held in any position desired by means of friction clamps.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contact closes at 7-8 volts, or 8-10 M.P.H. and opens at 6-7 M.P.H. with a discharge of three amperes. Contact gap is .025-.035 inch, and the air gap between relay armature and coil core is .025-.035 inch.

LIGHTING.—Combination Switch Model No. 1244. The headlights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2cp. All lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to vibrate with a current flow of 25-30 amperes. It will continue to vibrate with a current flow not exceeding 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit-breaker terminals.

HUDSON

SUPER-SIX, EXPORT MODEL, R. H. D. (1923) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type EX-15-1, 6 volt, 105 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5224. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in the distributor bearing oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles. Thoroughly clean out and repack the driving gear housing with soft cup grease every six months.

Timing.—Breaker contacts begin to separate when the flywheel mark "A—" is at the indicator, spark control lever and breaker assembly in the fully advanced position. The mark "A—" in one-half inch before the top dead center mark "DCI & 6".

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .028 inch.

STARTER-GENERATOR.—Model No. 188. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch, a circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit, and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations.

GENERATOR.—Generator current regulation is by third brush system.

Amperes	Generator Data.	Model No. 188	R.P.M.
Neutral			600
6			800
10-12			1000
15			2000

Charging rate is varied by adjusting the third brush setting. Loosen the two screws in the third brush arm, and lengthen the arm to increase the charging rate. Shorten the arm to decrease the charging rate. Reseat the brush after adjusting position.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter-generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires a current of 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

American Bosch Generating, Starting and Lighting System
American Bosch Ignition

Plate No. 875

HUDSON

SUPER-SIX (1923)

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 106 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Compensating Timer-Distributor Model TC-6100. The direction of rotation of the distributor is clockwise, looking from the top of the distributor. The coil is mounted on the engine side of dash and is dust and water-proof. The timer-distributor is mounted on the right side of the engine over the gear housing. Contacts are made of tungsten and separate .020 inch. Contact surface should be flat. When the condition of the contact points affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oil-stone. If the points are excessively worn, they should be replaced.

Oiling.—Fill distributor oiler on the side of the distributor housing with light engine oil. Put one drop of oil (less rather than more) on the interrupter lever pivot. Place a bit of grease or vaseline about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. Follow closely the above lubrication directions every month. If the car is driven more than 1000 miles in a month, care must be given every 1000 miles.

Timing.—Breaker contact points begins to separate when the flywheel marking is opposite the indicator on flywheel case with No. 1 piston on the compression stroke, and spark control lever and breaker assembly fully advanced. To adjust timing, place spark control lever in fully advanced position, loosen clamping screw on timer arm and turn the distributor housing opposite to direction of rotation of the rotor shaft until points just open. Tighten the clamping screw, being careful not to disturb the relative position of the timing arm and housing.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plugs diameters are of the metric scale, gaps are .030 inch.

STARTER.—Model No. 926. The starter is a four pole, series wound motor. Starting mechanism, which is operated by foot pedal, carries an over-running clutch. See that motor connections are tight and clean. Keep commutator clean wiping it off with a clean cloth slightly moistened with gasoline. Wipe dry before operating. Motor takes 125-200 amperes to crank engine at 150 R.P.M. The direction of rotation is counter-clockwise, looking at commutator end.

Starter Test Data.

HUDSON

SUPER-SIX (1923)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

(Concluded From Page 875)

GENERATOR.—Model No. 1238. The direction of rotation is counter-clockwise, looking at commutator end. Generator current regulation is by the third brush system. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate. Maximum charging rate is 14 amperes, generator hot, reached at 1500 R.P.M. of the armature or approximately 25 M.P.H., car speed in high gear.

Generator Data.

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
10-12	1100	15-18	1100
12-14	1500	14-17	1500

Oiling.—Put 4 or 5 drops of light engine oil into each of the generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 6.5-7.5 volts, and opens at 0-2 amperes discharge. Relay contacts separate .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts closed. The relay is mounted on top of the generator frame and is enclosed within a metal case. To adjust relay connect ammeter in series with battery and gradually slow down generator. The contacts should open at the limits given above. Adjust by loosening or tightening the adjusting screws on the side of the relay. Be sure to resolder the screw after adjustment so as to eliminate the possibility of the screw becoming loose and changing the tension. Clean the contacts by drawing fine sandpaper between them.

LIGHTING.—Type S-106 Switch is used. The switch is mounted on the dash and is supplied with two faced levers one for controlling the lighting system and the other for operating the ignition system. The terminals on the back of the switch are marked for proper connections wires. Head lights are 6-8 volts, 21 cp., S.C. Side lamps are 6-8 volts, 2 cp., S.C. Dash and tail lights are connected in series. They are each 3-4 volts, 2 cp., D.C. and S.C. respectively.

FUSES.—Generator fuse is 5 amperes. All lighting and other fuses are 10 amperes.

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM

AMERICAN BOSCH IGNITION

BATTERY.—Exide, Type 3-DX-13-1, 6 volts, 90 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Coil Type TC-30. Timer-Distributor T-474. The direction of rotation is clockwise, looking from top of distributor. The distributor is of the compensating type, having automatic advance. It is mounted on the right side of the engine, on top of the gear housing. The coil is mounted on engine side of dash and is dust and waterproof. Contact points are made of tungsten and should separate .020 inch. Contact surface should be flat. If points become pitted, resurface with well worn No. 00 sandpaper. Adjust by moving the long contact screw backward or forward as necessary, before again putting into service.

Oiling.—Fill oiler on side of distributor housing with light engine oil once each month. Put one drop of oil (never more) on the interrupter lever pivot. Place a small bit of grease or vaseline (about the size of a match-head) on the interrupter fibre block on the side nearest the pivot post. Wipe off the inside of the distributor cap and the surface of the rotor with a clean cloth moistened with gasoline.

Timing.—Breaker contacts begin to separate when flywheel marking "DC 1-4" is opposite the indicator on the observation hole (on the flywheel housing) with piston No. 1 on compression stroke and spark control lever and breaker assembly in the fully advanced position. To adjust timing place spark control lever and breaker assembly in the fully advanced position. Then loosen clamping screw on timing arm and turn housing in a counter-clockwise direction until breaker contacts begin to open. Tighten clamping screw, being careful not to disturb the position of the housing and arm.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug gaps are .030 inch.

STARTER.—Type 926. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to the engine through a manual shift operated by the starting pedal.

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Type 1238. The direction of rotation is counter-clockwise, looking at commutator end. Third brush system is used for current regulation. Move the third brush in the direction of generator rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate. Maximum current output is 14 amperes, reached at 1300 R.P.M. of armature or approximately 25 M.P.H. car speed.

Generator Test Data

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
10-12.....	1100	15-18.....	1100
12-14.....	1500	14-17.....	1500

Oiling.—Put 3 or 4 drops of light engine oil in each generator oiler every month or 1000 miles.

RELAY.—Bosch, 6 volt. Relay is enclosed in a metal case and is mounted on top of the generator.

LIGHTING.—Head lights are each 6-8 volt, 21 cp., S.C. Dash and tail lights are connected in series. They are each 3-4 volt, 2 cp., S.C.

FUSES.—A Bosch Fuse Block, which carries all fuses, except the generator field fuse, is used. It is mounted on the engine side of the dash. Fuses are 10 amperes capacity. Generator field fuse, mounted on top of the generator, is 5 amperes.

DORT FOUR

MODELS 18 AND 23 (1923)

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L. Type HDN-311-X, 6 volts, 92 ampere-hour capacity. The starting capacity for 20 minutes is 105 amperes. The lighting capacity is 5 amperes for 18 hours. The positive (+) terminal is grounded.

IGNITION.—Connecticut Battery Ignition, Type 225-Y Breaker contacts separate .025 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Refill grease cup under distributor housing with vaseline or soft cup grease and turn down every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "1 & 4 DC" on flywheel is one inch past indicator. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters are 7/8 inch, and the gaps are .030 inch.

STARTER.—Model No. 525. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to engine by a Bendix drive. Starter cranks the engine at 100-150 R.P.M. taking a current of 100-150 amperes at 5-5.5 volts.

Starter Test Data			
Amperes	Volts	Torque	R.P.M.
35.....	6.0.....	0.....	5000
450.....	3.5.....	12 lb.-ft.....	Lock

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model No. 1223. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, loosen nut holding the third brush, and move the third brush in a counter-clockwise (direction of rotation) direction to increase the charging rate; and in the opposite (clockwise) direction to decrease the charging rate.

Generator Test Data		
Hot Test		
Amperes	R.P.M.	Volts
0.....	450.....	6.9
6.....	700.....	7.2
9.....	900.....	7.8
10.2 (max).....	1300.....	8.8
9.5.....	1700.....	8.0
7.0.....	2500.....	7.8

Generator motoring freely, takes a current of 4.0-4.5 amperes, running at 350-450 R.P.M. and the field takes a current of 2.5-3.0 amperes, at 6.3 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks this care must be given every 500 miles.

RELAY.—Relay closes at 450-500 R.P.M. or at 8-10 M.P.H. at 6.5-7.5 volts, and opens at 400-450 R.P.M. or 6-8 M.P.H. with a current discharge of 0-2 amperes. The relay contact gaps separate .013-.018 inch, and the air gap between coil core and relay armature is .012-.015 inch.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2 cp. Dome light is 6-8 volts, 4 cp. All lamps are of the single contact type.

FUSES.—All fuses are 10 amperes, and generator fuse is 5 amperes.

MODEL 58 (1922-23)

WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volts, 80 ampere-hour capacity. The starting capacity is 104 amperes for 20 minutes, and the lighting capacity is 5 amperes for 18 hours. The positive (+) terminal is grounded.

IGNITION.—Atwater-Kent Battery Ignition Distributor, Type RA. Coil, Type N-3. Breaker contacts separate .006 inch. If the condition of the contact points affect the ignition, remove and resurface on a medium hard oilstone, as the contacts are made of tungsten.

Oiling.—Remove the distributor cap and put 4 or 5 drops of light engine oil into the exposed oil hole. Apply, with a toothpick, a very small amount of vaseline on cam. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 drive.

Breaker.—Breaker contact begins to separate when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .025 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Cranks the engine at 125-145 R.P.M. taking a current of 125-150 amperes at 5.4 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
30-40	5.8	0	3500-6000
525	4	17 lb.-ft.	Lock

Oiling.—Put 5 or 6 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month this care must be given every 1000 miles.

GENERATOR.—Frame No. 35-AT. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the fibre plate in front of generator housing and loosen the brass nut, move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and to decrease the same, move the third brush in the opposite direction (clockwise). The maximum charging rate is 12-14 amperes reached at 1250-1500 R.P.M. of the armature or 20 M.P.H.

Generator Test Data (Hot)

Amperes	R.P.M.
0	500-550
12-14	1250-1500

Generator motoring freely, takes a current of 5-7 amperes, at 6 volts. The field test draws a current of 2-4 amperes, at 6 volts.

OILING:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles.

RELAY:—Type 301,210B. Relay contacts close at 450 R.P.M. of the generator armature or 7 M.P.H. with a generator voltage of 7-7.5 volts and open at 400 R.P.M. of the armature at 6 M.P.H. with a discharge current of 0-2 amperes. Relay contacts separate .045 inch and the air gap between the relay armature and coil core is .005 inch, contacts closed.

LIGHTING.—The head lamps are each 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. The dash, side, and tail lamps are each 6-8 volts, 2 cp. All lamps are of the single contact type.

FUSES.—All fuses are 10 amperes. Generator field fuse is 5 amperes.

HOLMES

SERIES 4 (1923)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-27, 12 volt, 70 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Eisemann, Type GSA-6. Breaker contacts separate .012 to .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 inch.

STARTER-GENERATOR.—Model K4R. Starter-generator is connected to the engine through a chain drive. Starter cranks the engine at 200 R.P.M., current being 60 amperes. Lock torque is 40 pound-feet, current being 210 amperes, at 10.5 volts. Torque at 400 R.P.M. is 9 pound-feet, current being 60 amperes at 11 volts. Running freely starter current is 6.5 amperes at 11.5 volts, armature revolving at 700 R.P.M.

GENERATOR.—Generator current regulation is by third brush system. Maximum charging rate is 12 amperes, reached at 1650 R.P.M. of the armature or 18-20 miles per hour. Generator begins to supply current at 850 R.P.M. of the armature or 9-10 miles per hour.

Amperes	Generator Data	R.P.M.
0		850
5		975
12		1650
8		4000

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the starting and ignition switch.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are each 12-16 volt, 2 cp. Tonneau lamp is 12-16 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

Plate No. 880

FOX

MODEL 7-F (1923)

WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SCINTILLA MAGNETO IGNITION

BATTERY.—Exide, Type 3-XC-17-1, 6 volts, 117.5 ampere-hour capacity. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 23.4 hours. The positive (+) terminal is grounded.

IGNITION.—Scintilla Magneto Model AM-6. Breaker contacts separate .010 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone, as they are made of tungsten.

Oiling.—Put 4 or 5 drops of light engine oil into each of the two oil wells every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is on compression stroke, marking "45" on flywheel housing on top dead center, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch and the gaps are .020 inch.

STARTER.—Frame No. 751. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter cranks the engine at 100-150 R.P.M. taking a current of 175-225 amperes, at 5-5.5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
38-52	5.5	0	3100-3800
650	4.0	21 lb. ft.	0 (Lock)

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 760. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator loosen the nut inside of the generator end bracket opposite the third brush and move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
0	450
8	675
15-17	1250
10	2000

Generator motoring freely, takes a current of 3.5-5 amperes, at 6-6.6 volts and the field draws a current of 2.5 amperes, at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. or 8-10 M.P.H. at 6.2-6.5 volts, and opens at 450-500 R.P.M. or 6-8 M.P.H. with a current discharge of 0-3 amperes. The contact gap is .015-.019 inch, and the air gap between relay armature and coil core is .055-.060 inch.

LIGHTING.—Clum Combination Switch is used. The head lights are each 6-8 volts, 21 cp. S. C. Auxiliary lights are 6-8 volts, 4 cp. S. C. Tail light is 6-8 volts, 4 cp. S. C. Signal and backing lights are each 6-8 volts, 21 cp. S. C. The dash light is 6-8 volts, 2 cp. D. C.

FUSES.—Generator field fuse is 5 ampere. Lighting fuses are 15 ampere.

HATFIELD

(1920-21)

DYNETO GENERATING, STARTING, AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volts, 111 ampere hours capacity. The starting capacity for 20 minutes is 120 amperes, and the lighting capacity is 5 amperes for 22½ hours. The positive (+) terminal is grounded.

IGNITION.—Distributor Model No. 16. Coil Model M. Breaker contacts separate .018-.024 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface with a flat jeweller's file or on a medium hard oilstone.

Oiling.—Fill grease cup on side of distributor housing with soft cup grease once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Apply a very small amount of vaseline to the rotor track occasionally during the first 2000 miles. After that the rotor track becomes glazed and it is only necessary to keep it wiped clean. Apply a very small amount of vaseline to distributor cam head once a month.

Timing.—Breaker contact begins to separate when piston No. 1 is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Model D-183. The starter is connected to engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. The starter cranks the engine at 150 R.P.M. taking a current of 130 amperes, at 3-4 volts. Brush tension is 2 pounds.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
35	6	0	5000
480-500	4.2	13-14 lb. ft.	Lock

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler every two weeks. If the car is driven more than 500 miles in two weeks this care must be given every 500 miles.

GENERATOR.—Model C-224. The direction of rotation is counter-clockwise. Looking at commutator end. The third brush system is employed for current regulation. To adjust the charging rate of the generator, remove the leather plug in the commutator end plate, and loosen the screw exposed. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate; and move the third brush in the opposite (clockwise) direction to decrease the charging rate. The maximum charging rate of 14 amperes is reached at 1400 R.P.M. of armature or 18 M.P.H. of car speed at high gear. Brush tension is 2 pounds.

Generator Test Data

Hot Test			Cold Test		
Amperes	R.P.M.	M.P.H.	Amperes	R.P.M.	M.P.H.
5	600		6	600	
10	900		13	900	
12 (Max.)	1200	20	15 (Max.)	1200	20
10	2000		12	2000	

Generator motoring freely takes a current of 4-6 amperes at 6 volts; and the field draws a current of 3½ amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-10 M.P.H. or 450-500 R.P.M. of armature, at 6.5 volts, and opens at 6-8 M.P.H. or 400-450 R.P.M. of armature with a current discharge of 0-3 amperes. The contact gap is .125 inch, and the air gap between relay armature and coil core is .030 inch.

LIGHTING.—Connecticut Switch Model No. 96-8-Y is used. Head lights are each 6-8 volts, 15 cp. Dash and dimmer (or auxiliary) lights are each 6-8 volts, 4 cp. Tail light is 6-8 volts, 2 cp. All lights are of the single base type.

OAKLAND

MODEL 6-44 (1923)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100-ampere-hour capacity. The starting capacity is 115 amperes for 20 minutes, and the lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 284-M. Distributor Model No. 606-D or 616-C. Breaker contacts separate .023 to .025 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

Oiling.—Refill the grease cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the breaker cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center mark on flywheel "UDC 1 & 6" is opposite the indicator on flywheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Diameter $\frac{7}{8}$ inch. Spark gaps are .025 to .030 inch.

STARTER.—Model No. 701-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10,000	65	5.7
2 lb. ft.	2250	175	5.1
6 lb. ft.	750	365	4.2
10 lb. ft.	225	500	3.5
12 lb. ft.	Lock	575	3.2

Above tests are made without gear reduction. Pressure of brushes on the commutator is 16-20 ounces.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oiler and fill grease cup every month or 1000 miles.

GENERATOR.—Model No. 917-F. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the shunt field circuit of the generator at a temperature of 175° F., reducing the maximum charging rate 8 amperes. Never touch the thermostat points. Maximum charging rate is 16-18 amperes, cold, reached at 1875 R.P.M. of the armature.

Generator Data

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
Cut in		820	Cut in		600
10.0	7.50	2000	14	7.90	1170
9.8	7.48	2200	18	8.35	1560
8.8	7.30	2600	18	8.35	2180
7.0	7.20	1400	7	7.20	840

Charging rate is varied by adjustment of the third brush setting. Third brush assembly is moved by turning a screw exposed in the commutator end plate. Pressure of main brushes on the commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Model No. 264-B. Relay closes at 8-10 miles per hour or 600-650 R.P.M. of the armature, and opens at 6-8 miles per hour or 550-600 R.P.M. of the armature. Relay contacts separate .012 to .015 inch. The air gap between the relay armature and the coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2 cp. Side lights (if used) are each 6-8 volts, 4 cp. All lights are of the single contact base.

OAKLAND

KURTZ

MODEL A (1921-22)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

KURTZ
Model A (1921-22)
Westinghouse Generating, Starting and Lighting System
Westinghouse Ignition

Plate No. 883.

BATTERY.—Prest-O-Lite, Type 617-SHC, 6 volts, 160 ampere-hour capacity. The starting capacity is 170 amperes for 20 minutes, and the lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .012-.016 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a flat jeweler's file. The bumper on the contact spring is 1/8 inch off center from the line through the center of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid stem at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid stem at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil into the distributor oiler on the side of the distributor housing once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .030 inch.

STARTER.—Frame No. 100. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive. Cranks the engine at 1600 R.P.M. of armature, taking a current of 145 amperes at 5.5 volts.

Starter Test Data			
Amperes	Volts	R.P.M.	Torque
35-45	5.5	4100-7000	0
475	4	Lock	12 lb. ft.

The brush tension should be 1 1/4 to 1 3/4 pounds on each brush.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 760. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, loosen the nut inside of the generator end bracket opposite the third brush. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, move the third brush in the opposite direction (clockwise). The maximum charging rate is 14 amperes, reached at 1250 R.P.M. of armature, when the generator is hot.

Generator Test Data	
Amperes	R.P.M.
6	725
11-14 (Max.)	1250
7-8	2000

Generator motoring freely takes a current of 3.5-5.0 amperes at 6.0-6.3 volts. The field draws a current of 2.5 amperes at 6.0-6.3 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 7 M.P.H. or 575 R.P.M. of armature, at 6.2-6.5 volts, and opens at 5 M.P.H. or 525-575 R.P.M. of armature. Adjust the spring tension on the relay armature so that the contacts open with a current discharge of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2-6.5 volts. The contact gap is .030-.035 inch, and the air gap between the relay armature and coil core is .005 inch, contacts fully closed. Resistance of the shunt coil is 68 ohms. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before putting into service again.

LIGHTING.—Briggs & Stratton Switch, Model 2367. Head lamps are 6-8 volt, 21 cp. Auxiliary head lamps are 6-8 volt, 4 cp. Dash, tail, side and dome lamps are each 6-8 volt, 2 cp. Stop light is 6-8 volt, 21 cp. All lamps have single contact base.

FUSES.—The generator fuse is 5 amperes.

MERCER

6 CYLINDER MODEL, SERIES 6 (1923) WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SPLITDORF MAGNETO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volts, 132 ampere-hours capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Splitdorf, Type SS, 6 cylinder magneto is used. Breaker contact points separate .020 inch to .024 inch when the fibre bumper is on the highest point of cam.

Oiling.—Put a few drops of light engine oil into each magneto oiler once every 500 miles. NOTE.—Do not put more than 2 or 3 drops, rather a drop less than too many, as the oil will gum the mechanism and cause considerable magneto trouble.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center on compression stroke spark control lever and breaker assembly fully retarded. To time the ignition, retard spark control lever and breaker assembly fully with piston No. 1 on compression stroke, rotate magneto drive shaft until the breaker contact points just begin to separate. At this point, connect the magneto to the engine drive shaft.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .020 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter running free, at 3500-6000 R. P. M. of armature, takes a current of 35-45 amperes at 5.5 volts. The lock torque is 17 pound-feet taking a current of 525 amperes, at 4 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 56-AT. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator remove the fibre plate on the front end of the generator housing, loosen the brass nut and move the brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, move the third brush in the opposite direction to rotation (clockwise).

Generator Test Data		
Amperes	R.P.M.	Volts
0	500	6.5
8	750	7.5
15-17 (Max)	1100-1600	8.0
7-12	2500	7.0

Generator motoring freely takes a current of 5 amperes at 6 volts. The field draws a current of 2.5 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-500 R.P.M. of armature or 8-10 M.P.H. at 6.5 volts, and opens at 400-450 R.P.M. of armature or 6-8 M.P.H. with a current discharge of 0-3 amperes. The contact gap is .030-.035 inch, contacts fully separated. The air gap between the relay armature and coil core is .015-.025 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dimmer lights are each 6-8 volts, 5 cp. Tail light is 6-8 volt, 4 cp. Dash light is 6-8 volts, 2 cp. All the above lights are of the single contact base type. Limousine dome and corner lights are each 6-8 volts, 2 cp. D. C. Coupe dome light is 6-8 volts, 4 cp. D. C.

DUESENBERG

SERIES 601 (1922) STRAIGHT EIGHT (1923) DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

DUESENBERG
Series 601 (1922), Straight Eight (1923)
Delco Generating, Starting, and Lighting System
Delco Ignition

Plate No. 885

BATTERY.—Willard, Type SR-5, 6 volts, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2135. Distributor Model 15735. The contacts separate .015-.020 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 30°. Automatic advance begins at 750 R.P.M. and reaches a maximum of 25° at 2400 R.P.M. The contact arm spring tension should be 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack distributor housing with medium soft cup grease up to advance ring and yoke once each season. A very small amount of soft grease or vaseline should be applied to breaker cam every 2000 miles. Apply a very small amount of vaseline to rotor track occasionally during the first 2000 miles until rotor track becomes glazed, then no further attention will be necessary.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke, is 1/2 inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded. Timing can also be made by locating marks 1:4 on the flywheel through inspection plate on top of flywheel housing. Be sure that piston No. 1 is on compression stroke, contacts begin to separate one-half inch past top dead center measured on flywheel.

Firing Order.—The firing order is 1, 5, 3, 7, 4, 8, 2, 6.

Spark Plugs.—The spark plug diameters are 18 millimeters, gaps are 1/32 inch.

STARTER.—Model No. 200. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to engine through a Bendix drive. Motor running free takes 50 amperes at 6 volts. Lock torque is 24 pound-feet at 2.75 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each of the starter brushes.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once each year saturate the wick in the oiler on the end of the Bendix gear case with light engine oil.

GENERATOR.—Model Nos. 237-242. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation on both models. The maximum charging rate on both models of generators is 17 amperes reached at 1600 R.P.M. of armature. Generator No. 237 is adjusted for current output by loosening the clamp nut on the end of the generator, turning the adjusting screw beneath the cover band, in a clockwise direction to increase the charging rate and in the opposite direction to decrease output. After the adjustment is completed be sure to tighten the clamp nut. Generator No. 242 is regulated by removing the cover band over the generator brushes, exposing the third brush clamp nut. First loosen the clamp nut and move the third brush plate by means of the adjusting handle in a clockwise direction to increase the output, and in a counter-clockwise direction to decrease the charging rate.

Generator Test Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
3 (Min.)	600		4 (Min.)	600	
12	1000		13.5	1000	
15-17 (Max.)	1600		16-19 (Max.)	1600	
12	2400		13	2400	

The brush tension of each of the generator brushes should be 1 1/4-1 3/4 lbs.

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 5745. The relay closes at 7 M.P.H. and opens at 3-4 M.P.H. Relay contact gap separates .025-.035 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Combination Switch No. 1226 is used. Head and spot lamps are 6-8 volts, 21 cp. Dimmer lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp. Dash lamp is 6-8 volts, 2 cp.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to function until the current flow does not exceed 15 amperes. The lock-out circuit breaker opens the circuit when the current flow reaches 25-35 amperes. While operating the current is less than one ampere.

METEOR

6-T CONTINENTAL ENGINE (1923) DELCO GENERATING, STARTING, AND LIGHTING SYSTEM. DELCO IGNITION.

METEOR
6-T Continental Engine (1923)
Delco Generating, Starting, and Lighting System.
Delco Ignition

Plate No. 886

BATTERY:—Exide, Type 3-XC-15-2, 6 volts, 105 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2159. Distributor Model No. 5251. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard stone. It is not necessary to grind the points if the same are pitted. Just brighten the surface of the point, and remove the raised surface of the opposite point.

Oiling:—Place 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Apply a little vaseline on to the rubber rotor track occasionally during the first 2000 miles. After the first 2000 miles, the track will become glazed, and it will only be necessary to keep the track wiped clean with a clean cloth. Apply a very small amount of vaseline about the size of a match head to the surface of the breaker cam every 2000 miles.

Timing:—Breaker or contact points begin to separate when piston No. 1 is on compression stroke, at top dead center, mark "UD" on flywheel is opposite the indicator on flywheel housing, breaker assembly and spark control lever in fully retarded position.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch, and gaps are .025 inch.

Firing Order:—The firing order is 1-5-3-6-2-4.

STARTER:—Model No. 208. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. When the starter is running free it takes a current of 36 amperes, at 6 volts. The lock torque is 27 lb. ft.

Oiling:—Put 8 or 10 drops of light engine oil into each starter oiler every month. If car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off the commutator. Keep oil and dirt off of the spiral shaft of the Bendix mechanism to secure perfect operation.

GENERATOR:—Model No. 165. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator loosen the three screws on the end plate of the generator, shift the third brush in the direction of the arrow on the bearing retainer plate to increase the charging rate, and in the opposite direction to decrease the same.

Generator Test Data

Amperes	R. P. M.
0.....	650
4.....	800
8.....	1000
12-16 (Max)	1600
8-12.....	2300

Oiling:—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Relay closes at 6-8 M. P. H. 7-8 volts, and opens at 5-6 M. P. H. with a current discharge of 0-3 amperes. The contact gap separates .025-.035 inch, contacts fully separated. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING:—Combination Switch, Model No. 1192 is used. The head lights are each 6-8 volts, 21 cp. Auxiliary lights are each 6-8 volts, 4 cp. Dash and tail lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER:—A circuit breaker mounted on the back of the combination switch is used in the place of fuses. Circuit breaker will operate with a current flow of 25-30 amperes, and will continue to operate with a current flow not exceeding 15 amperes. Also not over 15 amperes must pass with dead short circuit across the circuit breaker terminals.

Remy Ignition

Plate No. 888

MITCHELL

MODEL F-50 (1923), SERIAL NO. 15001 AND UP AND 33001 AND UP REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volts 113 ampere-hours capacity. The starting capacity is 120 amperes for 20 minutes. The lighting capacity is 5 amperes for 23.5 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-B. Distributor Model No. 366-A. Breaker contacts separate .022 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweller's file. It is unnecessary to grind the contacts if they are burned or pitted, just brighten the point and remove the raised portion of the opposite point.

Oiling.—Refill the grease cup under the distributor head with medium soft cup grease and turn down two or three turns every two weeks. Put a very small amount of vaseline, about the size of a matchhead on the fibre bumper of the contact arm, applying with a toothpick. These instructions should be followed every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 on compression stroke is 12 degrees or 1 11/16 inches before reaching top dead center, measured on flywheel, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are 7/8 inch, and the gaps are .025-.030 inch.

STARTER.—Model No. 721-B. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. The starter cranks the engine at 100-150 R.P.M. taking a current of 150-200 amperes, at 5-5.5 volts. The brush tension is 20-28 ounces.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
60 (Running Free)	5.7	0	4600
575	3.2	16 lb.-ft.	Lock

Oiling.—Fill oil cup on each end of starter with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off of the commutator. Keep grit and dirt off of Bendix drive to insure perfect operation.

GENERATOR.—Model No. 910-B. The direction of rotation is counter-clockwise, looking at commutator end. The ignition apparatus is attached to the generator. The third brush system is used for current regulation. To adjust the charging rate, loosen the screw exposed at the generator end plate and move the brush with the finger. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite (clockwise) direction. The thermostat is automatic and requires no attention. The maximum charging rate is 20 amperes, reached at 1800 R.P.M., when the generator is cold, or 22-25 M.P.H. carspeed in high gear.

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
9-12 (Max.)	8.0-8.5	1800-2000	0	(Relay Cut in)	675
			17-20	8.0-8.5	1500
			19-21 (Max.)	8.3-8.8	1800
			18.5		2500

The field draws a current of 5 amperes at 6 volts.

The brush tension is 14-18 ounces.

Oiling.—Fill grease cups at rear end of generator with cup grease every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 600-625 R.P.M. of armature, or 8-10 M.P.H. at 6.5 volts, and opens at 500-525 R.P.M. of armature or 6-8 M.P.H. with a current discharge of 0-1 amperes. The contact gap is .017-.020 inch, contacts fully separated. The air gap between relay armature and coil core is .012-.015 inch, contacts fully closed.

LIGHTING.—Briggs & Stratton Combination Switch No. 1804 is used. Head lights are each 6-8 volts, 21 cp. S. C. Tail light and dash light are each 6-8 volts, 2 cp. S. C. and D. C. respectively. Stop light is 6-8 volts, 21 cp.

FUSES.—10 amperes.

MOON

MODEL 6-58 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 100 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Place a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "UD" on flywheel opposite indicator in flywheel housing, spark control lever and breaker assembly in the fully retarded position. To set timing, loosen advance lever clamp screw and turn housing in a counter-clockwise direction until the contacts begin to separate. See that rotor is under contact which is connected to cylinder No. 1. Tighten clamp screw after making adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, and the gaps are .030 inch.

STARTER.—Model No. 181.. The starter is connected by a Bendix drive to the engine. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., and takes a current of 125-200 amperes at 5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
40-50	5.5	Running Free	4500
450-550	2.75	27 lb. ft.	Lock

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every 1000 miles or each month. Saturate the wick in the oiler on the Bendix gear case once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice a year.

GENERATOR.—Model No. 256. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band on the commutator end of generator housing, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (clockwise) of rotation. The third brush plate is held in any position by means of a friction clamp. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data

Amperes	R.P.M.
5	700
11	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-550 R.P.M. or 6-8 M.P.H., at 7 volts, and opens at 400-450 R.P.M., with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, contacts fully separated. The air gap is .025-.035 inch, with the contacts fully closed.

LIGHTING.—Combination Switch No. 1239 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary headlights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate, and will continue to operate with a current flow of not more than 15 amperes. Also not ver 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

Plate No. 889

PATERSON

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

MODEL 22-6-52 (1923)

7-R CONTINENTAL ENGINE

DELCO IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159, Distributor Model No. 5207. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put 3 or 4 drops of light engine oil in the oiler at the side of the distributor every 500 miles. Apply a very small amount of light grease or vaseline to the face of the cam every 1000 miles. If the track of the rotor button is not well polished it should receive a very small quantity of vaseline. Pack the distributor housing with light cup grease once each season.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive and a set of reduction gears. Running free the starter takes 30-40 amperes at 6 volts. The lock torque is 28 pound feet at 4 volts, the current being 525 amperes. Remove the grease plug in the reduction gear case and inject soft cup grease every six months.

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Model No. 165. Rotaton is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 16 amperes reached at 1200 R.P.M. of the armature.

Generator Data.

Amperes	R.P.M.
Neutral	550
4	800
8	1000
11-15	1200
11-14	2000

The charging rate of the generator is adjusted by shifting the third brush by loosening the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage of the generator reaches 7.5 volts, and opens when there is a discharge current of 0 to 2 amperes. Relay contacts separate .046 to .062 inches. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 24 cp. Dimmer lamps are 6-8 volt, 6 cp. Dash and tail lamps are 3-4 volt, 4 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes will start the vibrator, which, while operating, reduces the current to 3-5 amperes.

COMBINATION SWITCH.—Delco No. 1171.

SAYERS AND SCOVILL **MODEL CL, 6-T CONTINENTAL ENGINE (1923)** **DELCO GENERATING, STARTING, AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY.—Willard, Type SJRN-5, 6 volts, 110 ampere-hour capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5251. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweller's file. It is not necessary to grind the contact points if burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once a season. Apply a little vaseline to the rotor track occasionally during the first 2000 miles, after this, the track will be glazed, and it will be necessary to keep the track wiped clean with a clean cloth. Apply a very small amount of vaseline about the size of a match head to the surface of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 on compression stroke is at top dead center, mark "UD" on flywheel is opposite indicator on fly-wheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gap is .030 inch.

STARTER.—Model No. 208. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. When running free, the starter takes a current of 36 amperes. The lock torque is 27 pound-feet, taking a current of 500-600 amperes at 3-4 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off the commutator. Keep dirt and grit off of Bendix drive to insure perfect operation. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 256. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator, remove the cover band, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
5.....	700
11.....	1000
Max 14-16.....	1600
15.....	2000

The tension of each of the generator brushes should be from 1 1/4 to 1 3/4 pounds.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-9 M.P.H. or at 7-8 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, fully separated. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Combination Switch Model No. 1246 is used. The head lights are each 6-8 volts, 21 cp. Auxiliary lights are each 6-8 volts, 4 cp. Dash and tail lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the combination switch is used in the place of fuses. A current flow of 25-30 amperes will cause circuit breaker to operate, and it will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

SENECA

MODELS, L-2 (1921), 0-2 (1922), 50-51 (1922-23) AUTO-LITE GENERATING, STARTING, AND LIGHTING SYSTEM AUTO-LITE IGNITION.

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volts, 90 amperes-hour capacity. The starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded.

IGNITION.—Auto-Lite, Type CB-1072. Breaker contacts separate .025 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the one point and remove the raised portion of opposite point.

Oiling.—Remove the distributor cap and put 4 or 5 drops of light engine oil into the exposed oil hole every 250 miles and put a very small amount of vaseline on to breaker cam, applying with a toothpick.

Timing.—Breaker contacts just begin to separate when piston No. 1 is 7° past top dead center, entering power stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .028 inch.

STARTER.—Model MG. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. The starter cranks the engine at 125 R.P.M. taking a current of 150 amperes, at 5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
40-60	6	Running Free	4000
450	3-4	12 lb.-ft.	Lock

Oiling.—Put 4 or 5 drops of light engine oil into starter oilers every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Model GJ. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator, loosen the nut holding the third brush and shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 16 amperes, reached at 1800 R.P.M. of armature, or at 25 M.P.H. car speed in high gear.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	500	
16	1750-2000	20-25
10-11	3000-3500	

The generator motoring freely, takes a current of 4-5 amperes, at 6 volts. The field draws a current of 2.2 amperes, at 6 volts, and each coil separately draws 8.8 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7-9 M.P.H. at 6.5 volts, and opens at 450-500 R.P.M. of armature, or 5-7 M.P.H. with a current discharge of 0-1 amperes. The contact gap is .025-.035 inch, contacts fully separated. The air gap between coil core and relay armature is .010-.015 inch, relay contact fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. S. C. Stop or signal light is 6-8 volts, 21 cp. S. C. Side and tail lights are each 6-8 volts, 2 cp. S. C. Dash light is 6-8 volts, 2 cp. D. C.

REO
Model T-6 (1923), Serial No. 45,236 and Up
North East System

Plate No. 893

REO

SERIES B

MODEL T-6 (1923), SERIAL NO. 45,236 AND UP NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH-EAST IGNITION

BATTERY:—Willard, Type SJR-4. 6 volt. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 10,481. Distributor Model No. 10,560. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Never use emery cloth.

Oiling:—The distributor cap and rotor arm should be kept clean and dry. They ordinarily need no lubrication, because the carbon contacts are self-lubricating. Make sure that the carbon brush is free in its socket, also that the flat spring carrying the center contact is bent up sufficiently to make good contact with the distributor cap.

Timing:—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark "Spark" on flywheel is even with the top edge of right hand engine support, spark control lever and breaker assembly fully retarded.

Firing Order:—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs:—The spark plug gaps are .030 inch.

STARTER:—Model R. Type 3581-A. Starter is connected to the engine through a ratchet and chain on a universal shaft. If the starter mechanism ever fails to engage or takes hold with a thump or pound when the starter button is depressed, it is an indication that there is not enough tension on the friction cable. On the other hand if the pawl is not brought entirely out of engagement when the starter button is released, there is too much friction on the friction cable. To adjust the tension slack off or draw up on the nut which holds the end of the rod. The starter cranks the engine at 100 R.P.M. with a current of 95-110 amperes. Lock torque is 50 lb. ft., with a current of 470 amperes.

Oiling:—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. The reduction gear case is filled with No. 4 Keystone grease and requires very infrequent renewal.

GENERATOR:—Model MAT Type 3929-L-6. (With Ignition) The direction of rotation is counter-clockwise, looking at driving end. The third brush system is used for current regulation. To adjust the charging rate, loosen lock screws on the commutator end housing. Turning the adjusting screw in the clockwise direction increases the charging rate, and turning to the counter-clockwise direction decreases the charging rate. Be sure to tighten the lock screw in order that the adjustment of generator output is locked in position desired. The maximum charging rate is 18-19 amperes reached at 1350-1500 R. P. M. of the generator armature.

Generator Test Data			
Amperes (Cold)	Volts	R.P.M.	Amperes (Hot)
17	6.5	1250	15.6
18	7.0	1320	16.3
19	7.5	1440	17.0
20	8.0	1600	17.6
21	8.5		18.2

Oiling:—Put 4 or 5 drops of light engine oil into each generator oiler and oiler under distributor head every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. The gear case is packed with No. 4 Keystone grease and should be refilled each year.

RELAY:—Model No. 8212 and 11,690. Relay closes at 525 R.P.M. of armature or 10-12 M.P.H. at 6.5-7.5 volts, and opens at 425-500 R.P.M. of armature or 8-10 M.P.H., with a current discharge of 0-2 amperes. The contact gap is .025-.040 inch, contacts fully separated. The air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING:—Head lights are each 6-8 volts, 21 cp. Dash, dimmer and tail lights are each 6-8 volts, 2 cp. Trouble light is 6-8 volts, 2 cp. All the above lights are of the single contact type.

FUSES:—Generator fuse is 6 amperes, and the lighting fuses are 5 amperes each.

CASE

MODEL W (1922-23)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRG-5, 6 volts, 135 ampere-hour capacity. The starting capacity is 140 amperes for 20 minutes. The lighting capacity is 5 amperes for 22½ hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5251-5252. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once a season. Apply a little vaseline to rotor track occasionally during the first 2000 miles. After this the rotor track will be glazed, and it will only be necessary to keep the rotor track wiped clean with a clean cloth.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded. Locate the breaker cam carefully, so that when the backlash in the distributor gears is rocked forward the contacts will open, and when the backlash in the gears is rocked backward the contacts will just close. The distributor shaft rotates clockwise when viewed from the top.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark gap is .030 inch. Diameters are 7/8 inch.

STARTER.—Model No. 208. The direction of rotation is clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive and reduction gears. Starter cranks the engine at 110 R.P.M., taking a current of 300 amperes.

Starter Test Data

Torque	Amperes	Volts
Running Free.....	50.....	3.0
Lock Torque.....10 lb. ft.....	450.....	2.3

Starter brush tension is 40-50 ounces.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. Saturate the wick oiler in the Bendix gear case with light engine oil once each year. Every six months remove the grease plug and repack the reduction gear case with medium heavy cup grease.

GENERATOR.—Model No. 165. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the charging rate, move the third brush in the direction of rotation (counter-clockwise) and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 15-17 amperes, reached at 1600-1800 R.P.M. of armature. The brush tension is 25-30 ounces for the main brushes, and 20-30 ounces for the third brush.

Generator Test Data

Amperes	Volts	R.P.M.
0 (Cuts in).....	7-7.5.....	650
4.5.....		800
13-17 (Max.).....		1600
9-12.....		2300

Generator motoring freely takes a current of 4 amperes, at 6 volts, at armature speed of 450 R.P.M. The field draws a current of 3 amperes, at 5 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every two weeks.

RELAY.—Relay closes at approximately 8-9 M.P.H. or 650 R.P.M. of armature, and opens at approximately 550-600 R.P.M. of armature or 6-8 M.P.H., with a current discharge of 0-3 amperes. The contact gap separates .046-.062 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Delco Combination Switch No. 1196 is used. Head lights are each 6-8 volts, 21 cp. Dimmer lights are 6-8 volts, 4 cp. Side lights are each 6-8 volts, 4 cp. Signal light is 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2 cp. Tonneau light is 6-8 volts, 4 cp.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current of 25-30 amperes, and will continue to operate with a current flow not exceeding 15 amperes.

Delco System
Plate No. 894

ROLLS-ROYCE

MODEL 40/50 (1923)

BIJUR-ROLLS-ROYCE GENERATING, STARTING AND LIGHTING SYSTEM

AMERICAN BOSCH BATTERY AND MAGNETO IGNITION

BATTERY.—Exide, Type 6-XXC-13-1, 12 volts, 90 ampere-hour capacity. There is no ground. It is a two-wire system.

IGNITION.—American Bosch Special. The breaker contacts separate .014 inch. They are made of tungsten. If the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. It is not necessary to grind the points when the same are burned or pitted. Just brighten up the point and remove the raised portion of the opposite point. Magneto and American-Bosch breaker adjust to .014 inch.

Oiling.—Put 4 or 5 drops of light engine oil into each oiler of the distributor and magneto once a week. Remove battery ignition distributor rotor and contact breaker cup, and oil joints and sliding sleeves of advance mechanism with a few drops of light engine oil every month.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark on flywheel is 10° late, breaker assembly and spark control lever is fully retarded for the BATTERY IGNITION; and for the MAGNETO IGNITION magneto breaker contacts separate 6° early, with spark control lever fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Bijur Model E. X. 21. The starter is geared to the engine by two sets of epicyclic or planetary gears and chain 23.6 to 1 gear ratio. The direction of rotation is clockwise, looking at the commutator end. The starter cranks the engine at 70 R.P.M., taking a current of 100 amperes.

Starter Test Data

Torque	R.P.M.	Amperes
5 ft. lbs.	1400	130
10 ft. lbs.	1000	220
15 ft. lbs.	600	310

Brush tension is 32 ounces.

Oiling.—Put 8 or 10 drops of light engine oil into oilers at rear end of starter and top of epicyclic gear housings at front end. This oiling should be done every month. If the car is driven more than 2000 miles in a month, this care must be given every 2000 miles.

GENERATOR.—Model E. X. 11. The direction of rotation is clockwise, looking at commutator end or the pulley end. The charging rate is controlled by a relay regulator of the constant voltage type, of which the charging rate depends on the condition of the battery. The output of the generator is variable to the strength of the battery and the lights. The maximum charging rate is 14 amperes, reached at 820 R.P.M. of armature, or 15 M.P.H., car speed in high gear.

Amperes	R.P.M.	Volts
0	600	10
14 Low Battery	800	15
13 Low Battery	900 or Over	17
7 High Battery	750	14
6 High Battery	800 or Over	15

The brush tension is 22 ounces.

Oiling.—Fill oil cups on the both ends of the generator once a month with light engine oil. If the car is driven more than 2000 miles in a month, this care must be given every 2000 miles.

RELAY.—Bijur, Model KXL.R125-K12V. Relay closes at 10-11 M.P.H. or 600 R.P.M. of armature, at 13-14 volts, and opens at 9 M.P.H. or 500 R.P.M., with a current discharge of 0.5-1.5 amperes. The contact gap is .056 inch, relay contacts fully separated. The air gap between relay armature and coil core is .050 inch, contacts fully closed. The air gap of the voltage regulator is .060 inch, contacts fully closed.

LIGHTING.—Head lights are each 12 volts, 21 cp. Side and tail lights are each 12 volts, 4 cp. Dash and body lights are each 12 volts, 2 cp.

FUSES.—All fuses for chassis parts are 10 amperes. All body fuses are 5 amperes. The fuses are standard 1 1/4 inch S.A.E.

NOTICE.—The Rolls-Royce Co. of America, Springfield, Mass., recommends that no one should tamper with any of their machines who are not familiar with the same, but should consult their nearest service engineer or write to the factory at the above address, stating the troubles of the car.

Plate No. 895

COLE

MODEL 890 (1923)

NORTHWAY M-309 AND M-311 ENGINES

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 140 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a small amount of vaseline to the rotor track occasionally during the first 2000 miles. After this, it is only necessary to keep the rotor track wiped clean with a clean cloth moistened with gasoline. Be sure to wipe it dry before placing rotor track into operation. Repack distributor with medium soft cup grease up to the advance ring and yoke once each season.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is $1\frac{1}{2}$ inches before top dead center, measured on flywheel, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72 (M-309 engine), 259 (M-311 engine). The starter is connected to the engine by a Bendix drive. The direction of rotation is clockwise, looking at commutator end. Starter cranks the engine at 125 R.P.M., taking 40 amperes. The brush spring tension should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0 (Running free)	4500	40	6.0
17.5 lb. ft.	0 (Lock)	450-500	3.5

Oiling.—Oilless bearings are used. They require no attention. On the Model 259 starting motor saturate the wick in the oiler on the Bendix gear end of the motor with light engine oil once each year.

GENERATOR.—Model No. 153. The direction of rotation is counter-clockwise looking at commutator end. The generator begins to supply current at 7 miles per hour or 500 R. P. M. of armature and reaches its maximum current out-put of 14-16 amperes at 1400 R.P.M. of the armature or 18-25 M.P.H., car speed in high gear. Generator brush tension should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Generator Test Data

Amperes	R. P. M.
Neutral	500
10-12	900
14-16 (Max)	1400
11-13	2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be reseated after adjusting position.

Oiling.—Put 5 or 6 drops of light engine oil into each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LIGHTING.—Combination Switch Model No. 1154 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary lights are each 6-8 volts, 4 cp. Dash, dome, corner, and tail lights are each 6-8 volts, 4 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

Model No. 6-90 (1923)

Remy Ignition
Remy Generating, Starting and Lighting System
Plate No. 897

STUTZ

MODEL 6-90 (1923)

REMY GENERATING, STARTING, AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SR-5, 6 volts, 120 ampere-hours capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-P. Distributor Model No. 626-H. Breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and resurface with a fine jeweller's file or on a medium hard oilstone. It is not necessary to grind the contact points if they are badly pitted or burned. Just brighten up the surface of the point and remove the raised portion of the opposite point.

Oiling.—Fill oil cup under distributor head with light engine oil every two weeks. Apply a small amount of vaseline to the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top head center on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .022 inch.

STARTER.—Model No. 720-J. The starter is connected to the engine by an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. No. 1 S.A.E. flange mounting is used.

Starter Test Data

Torque	Amperes	Volts	R.P.M.
0 (Running Free)	65	5.0	6000 (Approx.)
15 ft.-lbs.	570	3.15	0 (Lock)

The brush tension is 20-28 ounces.

Oiling.—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model 917-J. The direction of rotation is counter-clockwise, looking at commutator end. The generator is base mounted, and is driven by a coupling at 1 1/2 times engine speed. The third brush system is used for current regulation with automatic thermostatic control. The charging rate is adjusted by loosening the screw on the end plate which holds the third brush and shift the same in the direction of rotation (clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (counter-clockwise). The maximum charging rate is 18 amperes, reached at 1900 R.P.M. of armature.

Generator Test Data

Hot Test	Cold Test
0.....675 (Relay cut-in.)	0.....675 (Relay cut-in.)
7.....7.0-7.3 850	7.....7.0-7.3 850
18-20 (Max.) 8.4 1900	18-20 (Max.) 8.4 1900
10-17.....2500	10-17.....2500

The brush tension is 14-18 ounces. The field test draws a current of 5 amperes at 6 volts.

Oiling.—Fill oil cups at each end of generator with light engine oil once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 675 R.P.M. of armature, or 10 M.P.H. at 6.9 volts; and opens with a current discharge of 0-3 amperes. The contact gap is .014 inch, contacts fully separated. The air gap between relay armature and coil core is .020 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Signal light is 6-8 volts, 15 cp. Side, tail, and instrument lights are each 6-8 volts, 2 cp. All of the above lights are of the single contact type. The instrument lights are grounded to the oil gauge.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted on the back of the combination switch takes the place of fuses.

STUTZ

SPEEDWAY FOUR MODEL (1923) REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

STUTZ
Speedway Four Model (1923)
Remy Generating, Starting and Lighting System
Plate No. 898

BATTERY.—Willard, Type SJRN-5, 6 volts, 120 ampere-hour capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Two coils are used. They are Model No. 2159. Distributor Model No. 5209. Breaker contacts separate .018 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline on rotor track during the first 2000 miles of operation.

Timing.—Breaker contacts begin to separate when piston No. 1 is 1½ inches (measured on flywheel) past top dead center entering power stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model No. 741-B. The starter is connected to the engine by a set of reduction gears, with overrunning clutch, meshed by the operator. The overrunning clutch permits the starting motor to revolve and crank the engine but prevents the engine from turning the starting motor. The direction of rotation is clockwise, looking at commutator end. The brush tension is 14-18 ounces. The starter cranks the engine at 100-150 R.P.M., taking a current of 150-175 amperes at 5.5 volts.

Starter Test Data.

Torque	Amperes	Volts	R.P.M.
0 (Running free)	75	5.0	2000
66 ft. lbs.	600	3.0	0 (Lock)

Oiling.—Put 8 or 10 drops of light engine oil into each of the starter oilers (at both ends of starter) every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model OF. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The maximum charging rate is 15.2-17.5 amperes at 7.95-8.2 volts, reached at 1450 R.P.M. of armature, or 25 miles per hour, car speed in high gear. The main brush tension is 15-18 ounces. The third brush tension is 7-9 ounces.

Generator Test Data

Amperes	Volts	R.P.M.
0	7.15	275
7	7.15	475
12	7.65	675
15.2-17.5 (Max.)	7.95-8.2	1450
11.0-15.0	7.55-7.95	2000

The charging rate may be slightly altered by filing away one edge of the third brush to reduce the third brush surface in contact with the commutator. Filing the edge nearest the nearest main brush will decrease the charging rate, while filing the opposite edge will increase the charging rate. Only a small portion of the third brush may be thus removed or excessive sparking will result. The generator field takes 1.3 amperes at 6.5 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 264-C. Relay closes at 7-9 M.P.H. or 275 R.P.M. of armature or 6.5 volts, and opens at 6-8 miles per hour or at 250 R.P.M. of armature with a current discharge of 0-1 ampere. The relay contact gap is .013-.015 inch, contact points fully separated. The air gap between relay armature and coil core is .012 to .015 inch, contact points fully closed.

LIGHTING.—Combination Switch Model No. 1175 is used. The head lights are each 6-8 volts, 21 cp. Auxiliary head lights or dimmer lights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. Spot light is 6-8 volts, 21 cp. All of the above lights are of the single contact type.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. Circuit breaker begins to operate with a current of 25-30 amperes and continues to vibrate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with dead short circuit across the circuit breaker terminals.

APPERSON
 Model 6-23 (1923)

 Plate No. 899

APPERSON

MODEL 6-23 (1923)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Prest-O-Lite, Type 613 S.H.C., 6 volts, 100 ampere-hour capacity. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. The negative (-) terminal is grounded.

IGNITION.—Coil Model No. 284-L. Distributor Model No. 626-H. The breaker contacts separate .020-.025 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. It is not necessary to grind the contact points if they are burned or pitted. Just brighten up the point and remove the raised portion of the opposite point.

Oiling.—Fill grease cups with medium soft cup grease and turn down every two weeks. Apply a very small amount of vaseline on the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded, or 15° early before reaching top dead center, measured on flywheel, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug gaps are .025-.035 inch.

STARTER.—Model No. 720-L. The starter is connected to the engine by an out-board Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. The starter is mounted with a No. 2 S. A. E. flange.

Starter Test Data.

Torque	Amperes	Volts	R.P.M.
0 (Running Free)	65	5.00	6000
15 ft. lbs.	570	3.15	0 (Lock)

The brush tension is 20-28 ounces.

Oiling.—Fill the oil cup with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off of commutator, and dirt, grit and oil off Bendix drive to insure perfect operation.

GENERATOR.—Model No. 917-L. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system and thermostatic control are used for current regulation. To increase the current output, shift the third brush in the direction of rotation (counter-clockwise). To decrease the generator charging rate, shift the third brush in the opposite direction (clockwise). The thermostat is automatic.

Generator Test Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	675 (Relay cut in)	7.0-7.3	9-12 (Max.)	8.4	1800-2000
7	7.0-7.3	850			
18-20 (Max.)	8.4	1900			
10-17	2500				

The brush tension is 14-18 ounces. The generator field draws a current of 5 amperes at 6 volts.

Oiling.—Fill oil cups at each end of the generator housing every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 265-A. Relay closes at 9-10 miles per hour, car speed in high gear, or at 675 R. P. M. of armature. The relay contact points separate .010-.016 inch, contacts fully separated. The air gap between relay armature and coil core is .010-.020 inch, relay contacts fully closed. Clean relay contact points by drawing unglazed paper between them. If the same are badly pitted or burned, remove and resurface on a medium hard oilstone.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Headlights when dimmed are 4 cp. Dash, dome, cowl, tail and tonneau lights are each 6-8 volts, 2 cp.

FUSES.—All fuses are 10 amperes capacity.

ROLLS-ROYCE

MODEL 40-50 (1924)

BIJUR-ROLLS-ROYCE GENERATING, STARTING AND LIGHTING SYSTEM

AMERICAN BOSCH BATTERY AND MAGNETO IGNITION

BATTERY.—Exide, Type 6-XXC-13-1, 12 volts, 90 ampere-hour capacity. There is no ground. It is a two-wire system.

IGNITION.—American Bosch Special. The breaker contacts separate .014 inch. They are made of tungsten. If the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. It is not necessary to grind the points when the same are burned or pitted. Just brighten up the point and remove the raised portion of the opposite point. Magneto and American-Bosch breaker adjust to .014 inch.

Oiling.—Put 4 or 5 drops of light engine oil into each oiler of the distributor and magneto once a week. Remove battery ignition distributor rotor and contact breaker cup, and oil joints and sliding sleeves of advance mechanism with a few drops of light engine oil every month.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark on flywheel is 10° late, breaker assembly and spark control lever is fully retarded for the BATTERY IGNITION; and for the MAGNETO IGNITION magneto breaker contacts separate 6° early, with spark control lever fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Bijur Model E. X. 21. The starter is geared to the engine by two sets of epicyclic or planetary gears and chain 23.6 to 1 gear ratio. The direction of rotation is clockwise, looking at the commutator end. The starter cranks the engine at 70 R.P.M., taking a current of 100 amperes.

Starter Test Data

Torque	R.P.M.	Amperes
5 ft. lbs.	1400	130
10 ft. lbs.	1000	220
15 ft. lbs.	600	310

Brush tension is 32 ounces.

Oiling.—Put 8 or 10 drops of light engine oil into oilers at rear end of starter and top of epicyclic gear housings at front end. This oiling should be done every month. If the car is driven more than 2000 miles in a month, this care must be given every 2000 miles.

GENERATOR.—Model E. X. 11. The direction of rotation is clockwise, looking at commutator end or the pulley end. The charging rate is controlled by a relay regulator of the constant voltage type, of which the charging rate depends on the condition of the battery. The output of the generator is variable to the strength of the battery and the lights. The maximum charging rate is 14 amperes, reached at 820 R.P.M. of armature, or 15 M.P.H., car speed in high gear.

Amperes	R.P.M.	Volts
0	600	10
14 Low Battery	800	15
13 Low Battery	900 or Over	17
7 High Battery	750	14
6 High Battery	800 or Over	15

The brush tension is 22 ounces.

Oiling.—Fill oil cups on the both ends of the generator once a month with light engine oil. If the car is driven more than 2000 miles in a month, this care must be given every 2000 miles.

RELAY.—Bijur, Model KXL.R125-K12V. Relay closes at 10-11 M.P.H. or 600 R.P.M. of armature, at 13-14 volts, and opens at 9 M.P.H. or 500 R.P.M., with a current discharge of 0.5-1.5 amperes. The contact gap is .056 inch, relay contacts fully separated. The air gap between relay armature and coil core is .050 inch, contacts fully closed. The air gap of the voltage regulator is .060 inch, contacts fully closed.

LIGHTING.—Head lights are each 12 volts, 21 cp. Side and tail lights are each 12 volts, 4 cp. Dash and body lights are each 12 volts, 2 cp.

FUSES.—All fuses for chassis parts are 10 amperes. All body fuses are 5 amperes. The fuses are standard 1 1/4 inch S.A.E.

NOTICE.—The Rolls-Royce Co. of America, Springfield, Mass., recommends that no one should tamper with any of their machines who are not familiar with the same, but should consult their nearest service engineer or write to the factory at the above address, stating the troubles of the car.

Plate No. 900

HOLMES SERIES 4 (1924) DYNETO GENERATING, STARTING AND LIGHTING SYSTEM EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-27, 12 volt, 70 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Eisemann, Type GSA-6. Breaker contacts separate .012 to .015 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{1}{2}$ inches before the indicator, spark control in the fully retarded position.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

SPARK PLUG GAPS.—Spark plug gaps are .028 inch.

STARTER-GENERATOR.—Model K4R. Starter-generator is connected to the engine through a chain drive. Starter cranks the engine at 200 R.P.M., current being 60 amperes. Lock torque is 40 pound-feet, current being 210 amperes, at 10.5 volts. Torque at 400 R.P.M. is 9 pound-feet, current being 60 amperes at 11 volts. Running freely starter current is 6.5 amperes at 11.5 volts, armature revolving at 700 R.P.M.

GENERATOR.—Generator current regulation is by third brush system. Maximum charging rate is 12 amperes, reached at 1650 R.P.M. of the armature or 18-20 miles per hour. Generator begins to supply current at 850 R.P.M. of the armature or 9-10 miles per hour.

Amperes	Generator Data	R.P.M.
0		850
5		975
12		1650
8		4000

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the starting and ignition switch.

LAMPS.—Head lamps are 12-16 volt, 21 cp. Dimmer lamps are 12-16 volt, 6 cp. Dash and tail lamps are each 12-16 volt, 2 cp. Tonneau lamp is 12-16 volt, 2 cp.

FUSES.—Fuses are 15 ampere.

MERCER
Series 6 (1924)
Westinghouse Generating, Starting, and Lighting System
Splitdorf Magneto Ignition
Plate No. 902

MERCER

6 CYLINDER MODEL, SERIES 6 (1924) WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SPLITDORF MAGNETO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volts, 132 ampere-hours capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Splitdorf, Type SS, 6 cylinder magneto is used. Breaker contact points separate .020 inch to .024 inch when the fibre bumper is on the highest point of cam.

Oiling.—Put a few drops of light engine oil into each magneto oiler once every 500 miles. **NOTE.**—Do not put more than 2 or 3 drops, rather a drop less than too many, as the oil will gum the mechanism and cause considerable magneto trouble.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center on compression stroke spark control lever and breaker assembly fully retarded. To time the ignition, retard spark control lever and breaker assembly fully with piston No. 1 on compression stroke, rotate magneto drive shaft until the breaker contact points just begin to separate. At this point, connect the magneto to the engine drive shaft.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .020 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter running free, at 3500-6000 R. P. M. of armature, takes a current of 35-45 amperes at 5.5 volts. The lock torque is 17 pound-feet taking a current of 525 amperes, at 4 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 56-AT. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator remove the fibre plate on the front end of the generator housing, loosen the brass nut and move the brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, move the third brush in the opposite direction to rotation (clockwise).

Generator Test Data		
Amperes	R.P.M.	Volts
0	500	6.5
8	750	7.5
15-17 (Max)	1100-1600	8.0
7-12	2500	7.0

Generator motoring freely takes a current of 5 amperes at 6 volts. The field draws a current of 2.5 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-500 R.P.M. of armature or 8-10 M.P.H. at 6.5 volts, and opens at 400-450 R.P.M. of armature or 6-8 M.P.H. with a current discharge of 0.3 amperes. The contact gap is .030-.035 inch, contacts fully separated. The air gap between the relay armature and coil core is .015-.025 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dimmer lights are each 6-8 volts, 5 cp. Tail light is 6-8 volt, 4 cp. Dash light is 6-8 volts, 2 cp. All the above lights are of the single contact base type. Limousine dome and corner lights are each 6-8 volts, 2 cp. D. C. Coupe dome light is 6-8 volts, 4 cp. D. C.

Plate No. 903

HANSON **MODEL 54 (1924)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION** **7-R CONTINENTAL ENGINE**

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5207. Breaker contacts separate .018 inch. They are made of platinum. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

OILING.—Put 3 or 4 drops of light engine oil in the ignition unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 164 or 181. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Running free the starter takes 36 amperes at 6 volts. Lock torque is 27 lb. ft. at 2.75 volts. The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every month or each 1000 miles. Remove the grease plug and refill the reduction gear housing with medium soft cup grease every six months. Saturate the wick in the oiler on the end of the Bendix gear with light engine oil once a year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut, until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

STEPHENS
Model 10-20 (1924)
Delco Systems
Plate No. 904

STEPHENS

MODEL 10-20 (1924) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—U. S. L., 313-X, 6 volt, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5257. The contact points are made of tungsten. If condition of contacts affects ignition, remove and resurface on a medium hard oilstone. Breaker contacts separate .020 to .027 inch.

Oiling.—Put 4 or 5 drops of light engine oil into distributor oiler once every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts separate when piston entering power stroke is at top dead center.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model No. 262. The direction of rotation, looking at commutator end is counter-clockwise. Brush tension is $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds. Stall torque is 10 pounds, taking 450 amperes at 2.3 volts. Starter running free takes 50 amperes at 6 volts. Connection to the engine is through a Bendix drive.

Oiling.—Put 4 or 5 drops of light engine oil into starter oilers every two weeks. If car is driven over 500 miles in two weeks, this care must be given each 500 miles.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise. The third brush system is employed for current output regulation. The maximum charging rate is 18 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data					
Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
4		800	4		800
8		1000	9		1000
14-16		1600	15-18		1600
15		2000	17		2000

To adjust the charging rate loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of all the generator brushes should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be

RELAY.—Model No. 5754. Relay closes at 6.75 to 7.5 volts and opens at 3 amperes discharge. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Auxiliary lamps are 6 volts, 6 cp. Dash, tail, tonneau and side lamps are 6 volts, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes. Vibration continues to function with a current flow not exceeding 15 amperes.

Circuit breaker will function with a current flow of 25-30 amperes, and will confuse
FUSES—One fuse is used. Generator fuse is 2 amperes.

DODGE

1924

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM DODGE-NORTH-EAST IGNITION

BATTERY.—Willard, Type SJR-26, also Exide, 12 volt, 51.4 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Type 10,205. Distributor Model O, Type 10,004. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Force grease into distributor by means of a grease nipple, using a pressure feed grease gun once every month or 2000 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER-GENERATOR.—Model GA, Type 3804-A. The direction of rotation is counter-clockwise, looking at the commutator end. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as permit 1/2 inch up-and-down play midway between the sprockets.

Starter Data.

Torque	R.P.M.	Amperes
6 lb. ft.	460	49
10 lb. ft.	350	78
13 lb. ft.	295	95
16 lb. ft.	233	116
35 lb. ft.	Lock	225

GENERATOR.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0	1000	0.0	900		
5.0	1200	5.5	1100		
7.0	1200	8.0	1200		
8.0	1800	9.0	1800		
6.0	3400	7.0	3800		

Charging rate is varied by adjusting the third brush. The position of the brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate, and in counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes. Main and third brush tension is 1-1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every 2000 miles.

RELAY.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R.P.M. of armature, and opens at 8 1/2 miles per hour, or 900 R.P.M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volts, 21 cp. Dash and tail lamps are each 12-16 volts, 2 cp. Dome lamp is 12-16 volts, 4 cp. All lamps have single contact base.

FUSES.—Field fuse, mounted on generator frame, is 10 amperes.

1924

North-East Generating, Starting and Lighting System
Dodge North East Ignition

Plate No. 905

STUTZ

SPEEDWAY FOUR MODEL (1924) REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

STUTZ
Speedway Four Model (1924)
Remy Generating, Starting and Lighting System
Delco Ignition
Plate No. 906

BATTERY.—Willard, Type SJRN-5, 6 volts, 120 ampere-hour capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Two coils are used. They are Model No. 2159. Distributor Model No. 5209. Breaker contacts separate .018 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline on rotor track during the first 2000 miles of operation.

Timing.—Breaker contacts begin to separate when piston No. 1 is 1½ inches (measured on flywheel) past top dead center entering power stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model No. 741-B. The starter is connected to the engine by a set of reduction gears, with overrunning clutch, meshed by the operator. The overrunning clutch permits the starting motor to revolve and crank the engine but prevents the engine from turning the starting motor. The direction of rotation is clockwise, looking at commutator end. The brush tension is 14-18 ounces. The starter cranks the engine at 100-150 R.P.M., taking a current of 150-175 amperes at 5.5 volts.

Starter Test Data.

Torque	Amperes	Volts	R.P.M.
0 (Running free)	75	5.0	2000
66 ft. lbs.	600	3.0	0 (Lock)

Oiling.—Put 8 or 10 drops of light engine oil into each of the starter oilers (at both ends of starter) every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model OF. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. The maximum charging rate is 15.2-17.5 amperes at 7.95-8.2 volts, reached at 1450 R.P.M. of armature, or 25 miles per hour, car speed in high gear. The main brush tension is 15-18 ounces. The third brush tension is 7-9 ounces.

Generator Test Data

Amperes	Volts	R.P.M.
0	7.15	275
7	7.15	475
12	7.65	675
15.2-17.5 (Max.)	7.95-8.2	1450
11.0-15.0	7.55-7.95	2000

The charging rate may be slightly altered by filing away one edge of the third brush to reduce the third brush surface in contact with the commutator. Filing the edge nearest the nearest main brush will decrease the charging rate, while filing the opposite edge will increase the charging rate. Only a small portion of the third brush may be thus removed or excessive sparking will result. The generator field takes 1.3 amperes at 6.5 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 264-C. Relay closes at 7-9 M.P.H. or 275 R.P.M. of armature or 6.5 volts, and opens at 6-8 miles per hour or at 250 R.P.M. of armature with a current discharge of 0-1 ampere. The relay contact gap is .013-.015 inch, contact points fully separated. The air gap between relay armature and coil core is .012 to .015 inch, contact points fully closed.

LIGHTING.—Combination Switch Model No. 1175 is used. The head lights are each 6-8 volts, 21 cp. Auxiliary head lights or dimmer lights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. Spot light is 6-8 volts, 21 cp. All of the above lights are of the single contact type.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. Circuit breaker begins to operate with a current of 25-30 amperes and continues to vibrate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with dead short circuit across the circuit breaker terminals.

FUSES.—One fuse is used. Generator fuse is 2 amperes.

Models 690, 692 and 695 (1924)

Platt, No. 907

STUTZ

MODELS 690, 692 AND 695 (1924) REMY GENERATING, STARTING, AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Model 690, Willard, Type SR-5, 6 volt, 120 ampere-hour; Models 692 and 695, Willard, Type XR-17, 6 volt. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-P. Distributor Model No. 626-H. Breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and resurface with a fine jeweller's file or on a medium hard oilstone. It is not necessary to grind the contact points if they are badly pitted or burned. Just brighten up the surface of the point and remove the raised portion of the opposite point.

Oiling.—Fill oil cup under distributor head with light engine oil every two weeks. Apply a small amount of vaseline to the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top head center on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .022 inch.

STARTER.—Model No. 720-J. The starter is connected to the engine by an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. No. 1 S.A.E. flange mounting is used.

Starter Test Data

Torque	Amperes	Volts	R.P.M.
0 (Running Free)	65	5.0	6000 (Approx.)
15 ft.-lbs.	570	3.15	0 (Lock)

The brush tension is 20-28 ounces.

Oiling.—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model 917-J. The direction of rotation is counter-clockwise, looking at commutator end. The generator is base mounted, and is driven by a coupling at 1 1/2 times engine speed. The third brush system is used for current regulation with automatic thermostatic control. The charging rate is adjusted by loosening the screw on the end plate which holds the third brush and shift the same in the direction of rotation (clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (counter-clockwise). The maximum charging rate is 18 amperes, reached at 1900 R.P.M. of armature.

Generator Test Data

Hot Test		Cold Test	
9-12 (Max.)	8.0-8.5	1800-2000	0.....675 (Relay cut-in.)
			7.....7.0-7.3 850
			18-20 (Max.) 8.4 1900
			10-17.....2500

The brush tension is 14-18 ounces. The field test draws a current of 5 amperes at 6 volts.

Oiling.—Fill oil cups at each end of generator with light engine oil once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 675 R.P.M. of armature, or 10 M.P.H. at 6.9 volts; and opens with a current discharge of 0.3 amperes. The contact gap is .014 inch, contacts fully separated. The air gap between relay armature and coil core is .020 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Signal light is 6-8 volts, 15 cp. Side, tail, and instrument lights are each 6-8 volts, 2 cp. All of the above lights are of the single contact type. The instrument lights are grounded to the oil gauge.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted on the back of the combination switch takes the place of fuses.

Models EK and EL (1924)
Remy Systems

Plate No. 908

STUDEBAKER

MODELS EK AND EL (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volts, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 284-A. Distributor Model No. 626-F. The breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or on a medium hard oilstone.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking UP-DC-1-6 is at the indicator, spark control lever and breaker assembly in the fully retarded position. **Firing Order.**—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model No. 723-A. Starter is connected to the engine through a chain drive and an overrunning clutch. The direction of rotation is clockwise, looking at the commutator end.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0	5	70	1000
70	3.25	600	Lock

The starter brush pressure should be 20-28 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles. Once each year remove the grease plug in the reduction gear case and repack with graphite cup grease. Every three months oil the starter clutch in the sprocket on the engine crankshaft with light engine oil through the oil hole on the forward side.

GENERATOR.—Model No. 917-E. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. A thermostat in the shunt field circuit cuts in a resistance that lowers the generator output approximately 50%.

Generator Data

Amperes	Cold Volts	R.P.M.	Amperes	Hot Volts	R.P.M.
0	Cut in	675			
7	7.1	850	6-9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 4 or 5 drops of light engine oil in each generator oiler every 1000 miles. **RELAY.**—Model 263-F. Relay is mounted on the dash. Relay contacts close at 8-10 M.P.H. with a generator voltage of 7.2 volts and open at 6-8 M.P.H. with a discharge current of 0-2.5 volts. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. S. C. Dash, tail and side lamps are each 6-8 volt, 2 cp. S. C. Tonneau, stop and dome lamps are each 6-8 volt, 4 cp. S. C.

FUSES.—The fuses are 10 amperes.

STUDEBAKER

MODEL EM (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type -3, 6 volts, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 626-A. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing.—Breaker contacts begin to separate when the flywheel marking "MA-AD-SP" is at the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Starter Model No. 720-C. The starter is connected to the engine through a Bendix drive, S.A.E., barrel mounted. The direction of rotation is counter-clockwise looking at commutator end, the brush tension being 20-28 ounces.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0 lb. ft.	5	65	6000
15 lb. ft.	3.15	570	Lock

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

GENERATOR.—Model 917-A. Generator current regulation is by the third brush system. Thermostat opens at 195° to 200° F., cutting down the maximum charging rate to 11 amperes. The direction of rotation is counter-clockwise, looking at the commutator end.

Cold Test			Generator Data			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.1	850	6-9		1450			
18-20	8.3-8.8	1800	11	8.2	1900			
17-10		2500						

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Model No. 264-B. Relay closes at 8-10 miles per hour, and opens at 6-8 miles per hour. Air gaps between relay armature and coil core is .012 to .015 inch, contact points closed. Contact opens .012 to .015 inch. Adjust spring tension by bending brass strip through which spring passes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp.S.C. Dash, tail and side lamps are each 6-8 volt, 2 cp.S.C. Dome, stop and corner lamps are each 6-8 volt, 4 cp.S.C.

FUSES.—Fuses are 10 ampere.

Model EM

Plate No. 909

Plate No. 910

FORD **MODEL T (1924)** **LIBERTY GENERATING, STARTING AND LIGHTING SYSTEM** **FORD IGNITION**

BATTERY.—Ford, Exide, U. S. L., or Prest-O-Lite, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magneto delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Oiling.—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of 1/4 kerosene and 3/4 light engine oil should be used.

Timing.—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 160 amperes at 5 volts.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Oiling.—Starter requires no oiling.

GENERATOR.—Type F.A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 2 cp.

JORDAN
Models K and L (1924)
Delco System

Plate No. 911

JORDAN MODELS K AND L (1924) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, Type XR-15, 6 volt, 113 ampere hour capacity

The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model 5255. Breaker contact gap is .022 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a hard oilstone.

Oiling.—Place 8 or 10 drops of light engine oil in distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Repack distributor shaft housing with soft cup grease up to advance ring and yoke once each season.

Timing.—Breaker contact points begin to separate when No. 1 piston is $3\frac{3}{8}$ inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded; or 25° early, measured on the flywheel, with spark control lever and breaker fully advanced.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Starter Model No. 208. The direction of rotation is clockwise, looking at commutator end. Starter cranks engine at 800 R.P.M. of motor armature, or 120 R.P.M. of engine, taking a current of 85 amperes (hot) or 105 amperes (cold).

Lock torque is 27 pound-feet at 2.75 volts. Starter running free draws 36 amperes at 6 volts. The brush tension of the starter brushes should be from $2\frac{1}{2}$ to $2\frac{3}{4}$ pounds each.

Oiling.—Repack once or twice a season with soft cup grease by means of the grease plugs on the side of the gear housing. Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. The wick under the oiler on the outward bearing of the splined shaft should be saturated with light engine oil every 2000 miles. The starting motor must be withdrawn from the engine for this purpose.

GENERATOR.—Model No. 256. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush is used for current regulation. The maximum charging rate is 15 amperes, reached at 15 miles per hour.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
5	_____	700	6	_____	700
11	_____	1000	12	_____	1000
14-16	_____	1600	15-18	_____	1600
15 Max.	_____	1800	17 Max.	_____	1800

Oiling.—Refill the two oil cups with light engine oil every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. Avoid lubricating in such amount that the oil would eventually foul the generator commutator, and perhaps interfere with the proper amount of current generated.

RELAY.—Model No. 5754. Relay closes at approximately 8 miles per hour, and opens at approximately 5 miles per hour. The contact gap is .025-.035 inch. The air gap between the relay armature coil core is .025-.035 inch, contacts closed.

LIGHTING.—Delco Combination Switch No. 1243 is used. Head lights are 6-8 volts, 21 cp. Auxiliary lights are 6-8 volts, 4 cp. Dash and tail lights are 6-8 volts, 2 cp.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. The circuit breaker is mounted on the back of the switch. In operation, the circuit breaker intermittently cuts off the flow of current and produces an audible clicking sound, giving warning of an abnormal condition in one of the lighting circuits. This action will continue until the ground is removed or the switch operated to cut off the circuit on which the ground exists. In this manner the circuit breaker protects the wiring, switch and storage battery. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to operate with a current flow of not more than 15 amperes. Length of plunger which changes the maximum break between contacts is normally .012-.030 inch. Air gap, totally, between the disc and the walls of the U-shaped frame is .019-.025 inch.

FOX

MODEL 7F (1924)

WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SCINTILLA MAGNETO IGNITION

BATTERY.—Exide, Type 3-XC-17-1, 6 volts, 117.5 ampere-hour capacity. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 23.4 hours. The positive (+) terminal is grounded.

IGNITION.—Scintilla Magneto Model AM-6. Breaker contacts separate .010 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone, as they are made of tungsten.

Oiling.—Put 4 or 5 drops of light engine oil into each of the two oil wells every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is on compression stroke, marking "45" on flywheel housing on top dead center, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch and the gaps are .020 inch.

STARTER.—Frame No. 751. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter cranks the engine at 100-150 R.P.M. taking a current of 175-225 amperes, at 5-5.5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
38-52	5.5	0	3100-3800
650	4.0	21 lb. ft.	0 (Lock)

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 760. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator loosen the nut inside of the generator end bracket opposite the third brush and move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
0	450
8	675
15-17	1250
10	2000

Generator motoring freely, takes a current of 3.5-5 amperes, at 6-6.6 volts and the field draws a current of 2.5 amperes, at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. or 8-10 M.P.H. at 6.2-6.5 volts, and opens at 450-500 R.P.M. or 6-8 M.P.H. with a current discharge of 0-3 amperes. The contact gap is .015-.019 inch, and the air gap between relay armature and coil core is .055-.060 inch.

LIGHTING.—Clum Combination Switch is used. The head lights are each 6-8 volts, 21 cp. S. C. Auxiliary lights are 6-8 volts, 4 cp. S. C. Tail light is 6-8 volts, 4 cp. S. C. Signal and backing lights are each 6-8 volts, 21 cp. S. C. The dash light is 6-8 volts, 2 cp. D. C.

NATIONAL

SERIES BB (1924)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 615-RHN, 6 volt, 125 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5211. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor shaft bearings every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when top dead center mark on the fly-wheel is $\frac{3}{4}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Frame 751. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 4000 R.P.M., taking a current of 38-52 amperes at 5.5 volts. Cranking the engine at 100-150 R.P.M., taking a current of 175-275 amperes at 5-5.5 volts. Lock torque being 21 pound-feet, current being 650 amperes, at 4.8 volts.

Starter Test Data

Torque	R.P.M.	Amperes
2.5	1450	140
4.0	1150	200
8.5	650	310
10.0	500	350
21.0	Lock	650

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 760. Generator current regulation is by the third brush system. Maximum charging rate is 15-17 amperes, reached at 1250 R.P.M. of the armature or 16-20 miles per hour. The direction of rotation is counter-clockwise, looking at commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	450	0	0	500	
8	675	6	6	725	
12	840	9	9	850	
15-17	1250	11-13	11-13	1250	
10	2000	7-8	7-8	2000	

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after the generator has been operated an hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes, when 6 volts pressure is applied to its terminal. When generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.6 volts.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted in generator frame. Relay closes at 450-500 R.P.M. of the armature or 8 miles per hour, and opens at 400-450 R.P.M. of the armature or 6 miles per hour. Charging current is 1-2 amperes at closing, and the discharge current 0-2 amperes at opening of relay contacts. Contacts separate .013 to .018 inch. The air gap between the armature (moving member) and coil core is .031 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3 to 5 amperes.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash and tail lamps are 3-4 volts, 2 cp.

FUSES.—One fuse is used in the generator, and it is 5 amperes.

DUESENBERG

STRAIGHT EIGHT (1924)

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SR-5, 6 volts, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2135. Distributor Model 15735. The contacts separate .015-.020 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 30°. Automatic advance begins at 750 R.P.M. and reaches a maximum of 25° at 2400 R.P.M. The contact arm spring tension should be 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack distributor housing with medium soft cup grease up to advance ring and yoke once each season. A very small amount of soft grease or vaseline should be applied to breaker cam every 2000 miles. Apply a very small amount of vaseline to rotor track occasionally during the first 2000 miles until rotor track becomes glazed, then no further attention will be necessary.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke, is 1/2 inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded. Timing can also be made by locating marks 1:4 on the flywheel through inspection plate on top of flywheel housing. Be sure that piston No. 1 is on compression stroke, contacts begins to separate one-half inch past top dead center measured on flywheel.

Firing Order.—The firing order is 1, 5, 3, 7, 4, 8, 2, 6.

Spark Plugs.—The spark plug diameters are 18 millimeters, gaps are 1/32 inch.

STARTER.—Model No. 200. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to engine through a Bendix drive. Motor running free takes 50 amperes at 6 volts. Lock torque is 24 pound-feet at 2.75 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each of the starter brushes.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once each year saturate the wick in the oiler on the end of the Bendix gear case with light engine oil.

GENERATOR.—Model No. 242. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 16-18 amperes, reached at 1600 R.P.M. of the armature. To adjust the charging rate, remove the cover band over the commutator and loosen the lock-nut on the end of the generator. Then shift the third brush mounting plate in a clockwise direction (direction of rotation) to increase the charging rate and in the opposite (counter-clockwise) direction to decrease the charging rate.

Generator Test Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
3 (Min.)		600	4 (Min.)		600
12		1000	13.5		1000
15-17 (Max.)		1600	16-19 (Max.)		1600
12		2400	13		2400

The brush tension of each of the generator brushes should be 1 1/4-1 3/4 lbs.

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contacts close at 7 miles per hour or at 7 to 7 1/2 volts and open at 3-4 M.P.H., with a discharge current of 0-3 amperes. Relay contacts separate .025 to .035 inch. The air gap between the relay armature and coil core is .025 to .035 inch, contacts closed.

LIGHTING.—Combination Switch No. 1226 is used. Head and spot lamps are 6-8 volts, 21 cp. Dimmer lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to function until the current flow does not exceed 15 amperes. The lock-out circuit breaker opens the circuit when the current flow reaches 25-35 amperes. While operating the current is less than one ampere.

DANIELS
Models 24-32 and 24-38 (1924)
Delco Systems

Plate No. 915

DANIELS

MODELS 24-32 AND 24-38 (1924) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRN-5. 140 ampere hour.

The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter $\frac{7}{8}$ inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 miles per hour or 500-550 R.P.M. of the armature, and opens at 6 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .040 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7.5 volts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 10-15 amperes.

MODEL 890 (1924)

NORTHWAY M-309 AND M-311 ENGINES

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 140 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a small amount of vaseline to the rotor track occasionally during the first 2000 miles. After this, it is only necessary to keep the rotor track wiped clean with a clean cloth moistened with gasoline. Be sure to wipe it dry before placing rotor track into operation. Repack distributor with medium soft cup grease up to the advance ring and yoke once each season.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is $1\frac{1}{2}$ inches before top dead center, measured on flywheel, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72 (M-309 engine), 259 (M-311 engine). The starter is connected to the engine by a Bendix drive. The direction of rotation is clockwise, looking at commutator end. Starter cranks the engine at 125 R.P.M., taking 40 amperes. The brush spring tension should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0 (Running free).....	4500.....	40.....	6.0
17.5 lb. ft.....	0 (Lock).....	450-500.....	3.5

Oiling.—Oilless bearings are used. They require no attention. On the Model 259 starting motor saturate the wick in the oiler on the Bendix gear end of the motor with light engine oil once each year.

GENERATOR.—Model No. 153. The direction of rotation is counter-clockwise looking at commutator end. The generator begins to supply current at 7 miles per hour or 500 R. P. M. of armature and reaches its maximum current output of 14-16 amperes at 1400 R.P.M. of the armature or 18-25 M.P.H., car speed in high gear. Generator brush tension should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Generator Test Data

Amperes	R. P. M.
Neutral	500
10-12	900
14-16 (Max)	1400
11-13	2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be reset after adjusting position.

Oiling.—Put 5 or 6 drops of light engine oil into each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LIGHTING.—Combination Switch Model No. 1154 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary lights are each 6-8 volts, 4 cp. Dash, dome, corner, and tail lights are each 6-8 volts, 4 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

R. & V. KNIGHT

MODEL H (1924)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 152 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the contact screw and lever arm.

Oiling.—Keep the lubricator under the breaker head filled with oil. Fill the oiler on the distributor shaft which supplies the wick oiler every two weeks or each 250 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{1}{2}$ inches before the indicator, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model ML-4091. Starter is connected to the engine through a Bendix drive.

The direction of rotation is counter-clockwise, viewed from the commutator end. Starter cranks the engine at 139 R.P.M., the current being 175 amperes at 5.3 volts.

Starter Data

Running Torque	R.P.M.	Amperes
2 lb. ft. _____	1600 _____	135 _____
6 lb. ft. _____	950 _____	260 _____
10 lb. ft. _____	610 _____	365 _____

Stalled Torque Data

Terminal Voltage	Stall Torque
2.0	10 lb. ft.
2.5	13 lb. ft.
3	16 lb. ft.
4	22 lb. ft.

The brush tension on the commutator is 2 pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model GJ-4020 Generator current regulation is by the third brush system. Maximum current output is 16 amperes, reached at 1700 R.P.M. of armature or 20 miles per hour.

Generator Test Data

Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
2.0	650	0.0	500
5.4	800	5.3	650
10	1150	12	950
12.6	1600	14	1150
12.3	2100	16	1700
11.6	2400	14.7	2500

Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY—Model CB-1072. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6 volt, 21 cp. Dimmer and tail lamps are 6 volt, 4 cp. Dash lamp is 6-8 volt, 2 cp.

FUSES.—Fuses are 20 ampere.

MODEL 20-25 (1924)

BOSCH GENERATING, STARTING AND LIGHTING SYSTEM

BOSCH IGNITION

BATTERY.—U. S. L., Type HDN-311-X, 6 volts, 90 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model T-C-20. Breaker contacts separate .023 inch. They are made of tungsten. If condition of points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into wick oilers once every month. If car is driven more than 1000 miles, this attention must be given every 1000 miles.

Timing.—Breaker begins to separate when top dead center of No. 1 piston is reached, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps separate .025 inch.

STARTER.—Model G-D-525. The direction of rotation, looking at commutator end of starter, is counter-clockwise. Cranks engine at 150 R.P.M., requiring 110 amperes.

Starter Data		
Torque	R.P.M.	Amperes
12 ft. lbs.	160	440
15 ft. lbs.		550

Maximum resistance is 0.0075 ohms, current being 400 amperes at 3 volts.

Oiling.—Put 4 or 5 drops of light engine oil into starter oilers every month.

GENERATOR.—Model G.D.636. The direction of rotation looking at commutator end of generator is counter-clockwise. The third brush system is used to regulate the current or voltage. The maximum charging rate is 14 amperes, reached at 1200 R.P.M. of armature or 16 miles per hour of car in high gear.

Generator Test Data			
Hot Test		Cold Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	500
7	660	7.5	660
10	900	11	900
12	1100	13	1100
14	1200	16	1200

Oiling.—Put 4 or 5 drops of light engine oil into generator wick oilers once a month. If car is driven over 1000 miles in a month, this attention must be given every 1000 miles.

RELAY.—The relay is mounted on generator housing, closed at 7 miles per hour or 500 R.P.M. of armature and opens at 7 M.P.H. or 500 R.P.M. of relay armature. Relay contacts separate .013 to .018 inch. The air gap between coil core and relay armature is .031 inch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. A dimmer resistance is used. Dash lamp and tail lamp are 6-8 volts, 2 cp. Dome lamps are furnished with closed cars only.

FUSES.—Three 10 ampere fuses are used.

NASH

MODELS 691 TO 699 INCLUSIVE (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY—Willard, Type SJRN-4, 6 volt, 111 ampere hour. The positive (+) terminal is grounded.

IGNITION—Coil Model No. 2178. Distributor Model No. 5263. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface lightly on an oilstone.

Oiling—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft vaseline on the face of the breaker cam every 1000 miles.

Timing—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. To time engine, loosen advance lever clamp screw and shift distributor cup in a counter-clockwise direction until breaker contacts begin to separate. Tighten clamp screw after making the adjustment. Make certain that the rotor is under the contact connected to the cylinder which is ready to fire.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—The spark plug gaps are .025 to .030 inch.

STARTER—Model No. 230. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch prevents the starter armature from being driven at excessive speed by the engine flywheel after the engine has started running under its own power. The direction of rotation is clockwise, looking at the commutator end. The lock torque is 21 to 23 pound-feet at 4 volts, the current being 500 amperes. The brush tension is 2 1/4 pounds.

Oiling—Put 4 or 5 drops of light engine oil in each of the two starter oilers each month. Remove the grease plug in the side of the reduction gear housing and repack the housing with medium cup grease once or twice each season. Every 2000 miles withdraw the starter from the engine and saturate the wick under the oiler on the outward bearing of the splined shaft with light engine oil.

GENERATOR—Model No. 269. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should be so loose that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Generator Data.

Amperes	R.P.M.
Neutral	650
4	800
8	1000
17-19	1500
8-12	2300

The charging rate is varied by loosening the generator cover band and shifting the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The brush tension on each of the generator brushes should be from 1 1/4 to 1 3/4 pounds.

Oiling—Put 8 or 10 drops of light engine oil in each of the generator bearings every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS—Head lamps are 6-8 volts, 21 cp. Dimmers are 6-8 volts, 4 cp. Side lamps are 6-8 volts, 2 cp. Dash and tail lamps are 6-8 volts, 2 cp. Tonneau lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes will cause this device to vibrate. While vibrating the current is 10-15 amperes.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—U. S. L., 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5262. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface lightly on an oilstone.

Oiling.—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft vaseline on the face of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—The spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 228. Starter is connected to the engine through a set of reduction gears meshed by the operator. An overrunning clutch prevents the starter armature from being driven at excessive speed by the engine flywheel after the engine has started running under its own power. The direction of rotation is clockwise, looking at the commutator end. Lock torque is 31 lb. ft. at 2.6 volts. Starter running free takes 60 amperes at 6 volts. The brush tension should be from 2 1/4 to 2 3/4 pounds on each of the starter brushes.

Oiling.—Put 4 or 5 drops of light engine oil in each of the two starter oilers each month. Remove the grease plug in the side of the reduction gear housing and repack the housing with medium cup grease once or twice each season. Every 2000 miles withdraw the starter from the engine and saturate the wick under the oiler on the outward bearing of the splined shaft with light engine oil.

GENERATOR.—Model No. 269. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should be so loose that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Generator Data.

Amperes	R.P.M.
Neutral	650
4	800
8	1000
17-19	1500
8-12	2300

To adjust the charging rate, loosen the generator cover band and shift the third brush plate by means of the handle attached. Shifting the brush in the direction of rotation (clockwise) increases the charging rate and in the opposite direction decreases it.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator oilers every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp., with dimmer resistance, 6-8 volt, 8 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker, mounted on the back of the switch, takes the place of fuses. A current of 25 to 30 amperes will start it vibrating, and it will continue to vibrate with a maximum current flow of 15 amperes until the cause of the excessive current has been removed or the switch operated to cut off the current.

RICKENBACKER
Model C (1924)
Bosch Generating, Starting, and Lighting System.
Bosch Ignition.

Plate No. 921

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

RICKENBACKER

MODEL C (1924) BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM BOSCH IGNITION.

BATTERY.—U. S. L., Type 3CVX-6X, 6 volt, 108 ampere-hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6248. Breaker contacts separate .020 inch. If the condition of the contact points affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill oil cup on distributor housing every two weeks. Place a few drops of light engine oil on the interrupter lever every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline on breaker cam every 1000 miles.

Timing.—Breaker contacts just begin to separate when mark "0" on the front fly-wheel is directly in the center on top with piston No. 1 on compression stroke; spark control lever and breaker assembly in the fully retarded position. To set the timing see that the spark lever and breaker assembly are fully retarded, then loosen the screw in the center of the cam and turn cam until the contact points just begin to separate.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are 7/8 inch, gaps are .022-.025 inch.

STARTER.—Model No. 933 CWDE. The direction of rotation is counter-clockwise looking at commutator end. The starter is connected to the engine by means of a manually operated shift equipped with an overrunning clutch. The starter cranks the engine at 150 R.P.M., taking 125-150 amperes at 6 volts. Brush tension is 2 3/4-3 1/2 pounds.

Starter Test Data			
Torque	R.P.M.	Volts	Amperes
0	2500	6	70
12	(0) Lock	4	500

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 1032. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is employed for current regulation. To increase the out-put, loosen the hexagon nut inside of generator or third brush housing and move brush in counter-clockwise direction; to decrease charging rate, move in clockwise direction. Maximum charging rate is 15 amperes, reached at 1600 R.P.M. or 20 M.P.H., car speed in high gear.

Generator Test Data.		
Cold Test. (20°C)		
0	6.5	600
5	6.75	700
10	7.2	1000
12	7.4	1200
14-15	7.5	1600
11.5	7.4	2400
Hot Test. (85°C)		
0	6.4	600
7	7	1000
9	7.2	1300
8-10	7.4	1650
8.6	7.4	2400

The brush tension should be 2 1/4 to 2 3/4 pounds each.

Oiling.—Fill oil cups with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 1032-CWDE. Relay closes at 7.5 M.P.H. or 600 R.P.M. of armature at 6.5-7.0 volts and opens at 450 R.P.M. or 5-6 M.P.H. or 0-2 amperes discharge. The contact gap is .015-.020 inch. Air gap between relay armature and coil core is .010 inch.

LIGHTING.—Head lamps are 6-8 volt, double filament bulb, 21 and 2 cp. D.C. Dimmer lamps are 6-8 volt, 2 cp. Dash, tail and side lamps are each 6-8 volt, 2 cp. S.C. Stop light is 6-8 volt, 21 cp. S.C. Combination switch—Basco No. 2276.

FUSES.—Two 20 ampere fuses are used. Generator field fuse is 5 ampere.

MARMON

MODEL 34-B (1923-24) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

MARMON
Model 34-B (1923-24)
Delco System
Plate No .922

BATTERY.—Prest-O-Lite, Type 617-SHC, 6 volt, 170 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2177. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on the flat side of a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in each distributor oiler every two weeks or each 500 miles. Pack the distributor gear housing up to the level of the distributor gears with medium heavy cup grease twice each year. Place a small amount of grease about the size of a match head on the breaker cam and polish the rotor track with a small amount of grease every 1000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is on top dead center on compression stroke with spark control lever advanced $5\frac{3}{4}$ inches from the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. Then loosen timing adjustment screw and turn the breaker cam until contact points just begin to separate. Tighten the adjustment screw and replace the distributor head, being careful that the rotor button is directly under the segment connected to the spark plug of cylinder No. 1.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model No. 254. The starter is connected to the engine through a mechanically operated pinion shift combined with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Test Data

Torque	Amperes	Volts
0	60	6
24 ft. lbs.	Lock	2.75

Brush pressure on all brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two starter oilers every 1000 miles or each month. Saturate the wick in the oiler in the starter end gear with engine oil once each year. Clean and repack the motor clutch with vaseline every year.

GENERATOR.—Model No. 253. Generator current regulation is by the third brush system. The direction of rotation is clockwise, looking at the commutator end. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the generator.

Generator Test Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
4	800	4	800
9	1000	8	1000
15-18	1600	14-16	1600
17	2000	15	2000

To adjust the charging rate, remove the cover band and shift the third brush plate by means of the handle. Shifting the third brush in the direction of the armature rotation (clockwise) increases the output and in the opposite direction (counter-clockwise) decreases the output. The third brush plate is held in any desired position by means of friction clamp washers. The brush tension of all brushes is $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two generator oilers every 500 miles or each two weeks.

RELAY.—Model 5754. Relay is mounted on top of the generator. Relay closes at 6-8 miles per hour or $6\frac{3}{4}$ to $7\frac{1}{2}$ volts and opens with a discharge current of 0 to 3 amperes. Relay contacts separate .025 to .035 inch. Air gap between the relay armature and the coil core is .025 to .035 inch, contacts closed. To raise the cut-in voltage increase the spring tension and to lower the cut-in voltage decrease the gap.

LIGHTING.—Combination Switch Model No. 1241. Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps and tonneau lamp are each 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C. Stop light is 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 2 cp. D.C.

CIRCUIT BREAKER.—Model Nos. 5742-5759. A vibrating circuit breaker takes the place of fuses in the head, dimmer, tail and dash lamp circuits. It requires a current of 25-30 amperes to start the circuit breaker vibrating. While vibrating the current is 10-15 amperes. A lock-out circuit breaker is placed in the horn, tonneau lamp and trouble lamp circuits. A current of 25-30 amperes causes it to open the circuit.

Super-Six Model (1924)
American Bosch Generating, Starting and Lighting System
American Bosch Ignition

Plate No. 923

HUDSON

SUPER-SIX MODEL (1924)

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 615-JFK, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Compensating Timer-Distributor Model T-6100. The direction of rotation of the distributor is clockwise, looking from the top of the distributor. The coil is mounted on the engine side of dash and is dust and waterproof. The timer-distributor is mounted on the right side of the engine over the gear housing. Contacts are made of tungsten and separate .020 inch. Contact surface should be flat. When the condition of the contact points affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oil-stone. If the points are excessively worn, they should be replaced.

Oiling.—Fill distributor oiler on the side of the distributor housing with light engine oil. Put one drop of oil (less rather than more) on the interrupter lever pivot. Place a bit of grease or vaseline about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. Follow closely the above lubrication directions every month. If the car is driven more than 1000 miles in a month, care must be given every 1000 miles.

Timing.—Breaker contact points begins to separate when the flywheel marking is opposite the indicator on flywheel case with No. 1 piston on the compression stroke, and spark control lever and breaker assembly fully advanced. To adjust timing, place spark control lever in fully advanced position, loosen clamping screw on timer arm and turn the distributor housing opposite to direction of rotation of the rotor shaft until points just open. Tighten the clamping screw, being careful not to disturb the relative position of the timing arm and housing.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plugs diameters are of the metric scale, gaps are .030 inch.

STARTER.—Model No. 926. The starter is a four pole, series wound motor. Starting mechanism, which is operated by foot pedal, carries an over-running clutch. See that motor connections are tight and clean. Keep commutator clean wiping it off with a clean cloth slightly moistened with gasoline. Wipe dry before operating. Motor takes 125-200 amperes to crank engine at 150 R.P.M. The direction of rotation is counter-clockwise, looking at commutator end.

Starter Test Data.

R.P.M.	Amperes	Volts	Torques	H.P.
3800	70.0	5.75	0	0
2250	100.0	5.7	0.6 lb. ft.	0.3
1000	200.0	4.0	3.6 lb. ft.	0.65
500	300.0	4.5	7.0 lb. ft.	0.76
250	400.0	4.0	11.0 lb. ft.	0.5
Lock	525.0	3.5	16.25 lb. ft.	0.0

Oiling.—Fill oilers on each end of starter with light engine oil once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

(Continued on Page 924)

HUDSON

SUPER-SIX MODEL (1924)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

(Concluded from Page 923)

GENERATOR.—Models 1238 and 1252. Direction of rotation is counter-clockwise looking at commutator end. Generator current regulation is by the third brush system. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate. Maximum charging rate is 16-18 amperes reached at 1200 R.P.M. with a generator temperature of 70 deg. F.

Generator Test Data

Amperes	R.P.M.
0	520
12	800
16-18	1200
17	1500
14	2000
10	3000

Oiling.—Put 4 or drops of light engine oil in each generator oiler every 1500 miles.

RELAY.—Relay closes at 6.5-7.5 volts, and opens at 0-2 amperes discharge. Relay contacts separate .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts closed. The relay is mounted on top of the generator frame and is enclosed within a metal case. To adjust relay connect ammeter in series with battery and gradually slow down generator. The contacts should open at the limits given above. Adjust by loosening or tightening the adjusting screws on the side of the relay. Be sure to resolder the screw after adjustment so as to eliminate the possibility of the screw becoming loose and changing the tension. Clean the contacts by drawing fine sandpaper between them.

LIGHTING.—Type S-106 Switch is used. The switch is mounted on the dash and is supplied with two faced levers one for controlling the lighting system and the other for operating the ignition system. The terminals on the back of the switch are marked for proper connections wires. Head lights are 6-8 volts, 21 cp., S.C. Side lamps are 6-8 volts, 2 cp., S.C. Dash and tail lights are connected in series. They are each 3-4 volts, 2 cp., D.C. and S.C. respectively.

FUSES.—Generator fuse is 7.5 amperes. All other fuses are 10 ampere.

ESSEX

MODEL 1924

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK. 6 volt, 85 ampere hour. The starting capacity is 102 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model T-6200. Breaker contacts separate .020 inch. They are made of tungsten. The contact surface of both points should be flat. When the condition of the contacts affects the ignition, resurface them with a fine flat jeweler's file. If the points are excessively worn they should be replaced.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil. Put one drop of oil (never more) on the interrupter lever pivot. Place a small bit of cup grease, about the size of a match head, on the side of the interrupter fibre block nearest the pivot post. These attentions should be given every 1000 miles or each month.

Timing:—Breaker contact points begin to separate when, with piston No. 1 on compression stroke, the mark on the flywheel is just opposite the indicator on the flywheel case. To adjust timing, turn engine until this position is reached. Then loosen the clamping nut on the stud just below the distributor and turn the housing in a counter-clockwise direction (opposite to direction of rotation) until the contacts begin to separate. Tighten the nut, being careful not to change the relative positions of the housing and shaft. The distributor is of the full automatic type. No manual advance is provided.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—Spark plug gaps are .030 inch.

STARTER:—Type 940. The starter is connected to the engine by a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. The starter is a four pole, parallel wound machine using only two brushes.

Oiling:—Self-oiling bearings are used. They require no attention. Keep commutator clean and free from oil. Clean commutator by wiping it off with a clean cloth moistened with gasoline. Wipe dry before again using.

GENERATOR:—Type 1043. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 10 amperes (hot) at 8 volts, reached at 1600 R.P.M. of the generator.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	600
7	800	4	800
12	1200	8.5	1200
13.5	1600	10	1600
12.8	2000	9.5	2000
9	3000	6.5	3000

To adjust the charging rate, turn the adjusting screw on the outside of the commutator end plate. Turning the screw to the right increases the charging rate and to the left decreases the charging rate.

Oiling:—Put two or three drops of light engine oil in each of the generator oilers every 500 miles or each two weeks. See that commutator is clean and free from oil. Clean commutator by wiping it with a clean cloth moistened with gasoline. Wipe dry before again operating the generator.

RELAY:—No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Turning off the ignition disconnects the generator and prevents the battery from discharging.

LIGHTING:—Combination Switch Type S-116. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are connected in series. They are each 3-4 volt, 2 cp.

FUSES:—No generator fuse is used. Lighting fuse is mounted on the back of the switch and is 20 ampere. Two spare fuses are mounted at the bottom of the switch.

BUICK

MODELS 24-6-41, 44, 45, 47, 48, 49, 50, 51, 54, 55 (1924)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Ignition Coil No. 2176. Distributor is integral with motor-generator. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring is 13-16 ounces. The automatic advance starts at 580 R.P.M. and reaches a maximum of 16-20° at 1333 R.P.M. The total automatic and manual advance is 51°.

Oiling.—Apply a small amount of grease on the distributor track two or three times during the first 2000 miles. After this it will be necessary to keep the glazed surface wiped with a clean cloth. Apply a small amount of vaseline on the breaker cam each 1000 miles. See also starter-generator oiling.

Timing.—Breaker contacts begin to separate when the seven-degree mark on the fly-wheel (which is approximately one inch after top dead center) is at the indicator spark control lever and distributor drive shaft in the fully retarded position.

Firing Order.—The firing order is 1.4.2.6.3.5.

Spark Plugs.—Diameter 7/8 inch. Spark gaps are .030 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with ignition switch, a circuit is closed, allowing the current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gear. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. Direction of rotation is counter-clockwise looking at commutator end. The pressure of the upper motor brush on the commutator should be 4 1/2 to 5 pounds and 2 1/4 to 2 3/4 pounds on the lower brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	75
8 "	Lock	3.1	—

GENERATOR.—Starter-Generator Model No. 268. The third brush system is employed for current regulation.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	600	7-8
8-9	825	—
Max. 14-16	1600	20-25
12-15	1800	—

To adjust charging rate, remove end cover and loosen the third brush adjusting screw one or two turns. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease it. After making the adjustment tighten the adjusting screw. Generator motoring freely with overrunning clutch takes a current of 5.5 amperes at 6 volts. Field current is 2.5 amperes. The pressure of the generator brushes on the commutator should be 1 1/2 to 1 3/4 pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on each end of the starter-generator armature shaft and an equal amount in the upper distributor shaft bearing oiler every 500 miles or each two weeks. Fill the Alemite connections on the distributor housing and starter gear housing with lubricant every 500 miles. The starter clutch should be cleaned and repacked with soft cup grease once each year.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash, tail and side lamps are 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

BUICK
6-Cylinder Model (1924)
Delco Systems

Plate No. 926

BUICK

MODELS 24-4-33, 34, 35, 37 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-13-1, 6 volt, 84 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2176. Distributor is integral with the motor-generator. Breaker contacts separate .0225 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, they must be removed and resurfaced with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone. The condenser is mounted within the breaker housing, and the resistance unit on the side of the housing.

Oiling.—Place a small amount of vaseline on the surface of the breaker cam every 1000 miles. The track of the distributor hear should be treated with vaseline two or three times during the first 2000 miles. It will then become glazed and no further attention will be necessary except to wipe out the distributor head occasionally with a clean cloth. See also motor-generator oiling.

Timing.—Breaker contacts begin to separate when the seven-degree mark on the fly-wheel (which is approximately one inch after top dead center) is at the indicator, spark control lever and distributor drive shaft in the fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

STARTER.—Motor-Generator Model No. 251. Connection to the engine is by reduction gears and mechanical shift. Motor running free at 4000 R.P.M. of armature, taking 85-90 amperes, 5.5 volts. Cranking engine at 125 R.P.M., requiring 125-175 amperes, 5 volts. Lock torque requires 400-450 amperes, 3.5 volts.

GENERATOR.—Generator current regulation is by the third brush system. The maximum charging rate should not exceed 18 amperes, hot adjustment, under any circumstances. To adjust the charging rate loosen clamp screw on third brush carrier (to right of bearing, looking at commutator end). Move carrier to left to increase charging rate, and to the right to decrease the charging rate. Tighten the clamp screw after position adjustment.

Test Data		
Amperes	R.P.M.	M.P.H.
8.9	825	
0	600	
Max. 14-16	1500	20
12-15	1800	

Motoring freely at 250 R.P.M., taking 5-6 amperes, 6 volts, with over running clutch.

FIELD TEST.—Field draws 1.5-2 amperes, 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the two generator oilers every two weeks. Refill the Alemite connections on the distributor housing and the rear of the starter gear housing every two weeks. If the car is driven more than 500 miles in two weeks, these attentions should be given every 500 miles. Once each year the starter clutch should be cleaned and repacked with soft cup grease.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch. The opening and closing of the generator-battery circuit by the operator takes the place of the relay.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dome lamp is 6-8 volt, 4 cp. Dash, tail and side lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator, but 3-5 amperes will cause it to continue.

MOON

MODEL 6-40 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY—Exide, Type 3-XC-13-1, 6 volts, 85 ampere-hours capacity. The negative (—) terminal is grounded.

IGNITION—Coil Model No. 2178. Breaker contacts separate .020 inch. They are made of tungsten. If condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling—Put 4 or 5 drops of light engine oil into distributor oiler once a week. If car is driven over 250 miles in one week, this care must be given each 250 miles.

Timing—Breaker contact opens when piston No. 1 is at top dead center, entering on power stroke, spark control lever and breaker assembly fully retarded.

Firing Order—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps—Spark plug gaps separate .025 inch.

STARTER—Model 240. The direction of rotation looking at commutator end is counter-clockwise. The starter is connected to the engine through a Bendix drive. The lock torque is 12 pound feet.

Starter Test Data

Torque	R.P.M.	Amperes
0.0		50
1.0	2600	110
1.5	2175	140
2.0	1900	160
2.5	1650	180
3.0	1450	200

The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds on each brush.

Oiling—Put 4 or 5 drops of light engine oil into starter oilers every week. If car is driven over 250 miles in one week, this care must be given every 250 miles.

GENERATOR—Model No. 257. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is employed for current regulation. The maximum charging rate is 17 amperes, reached at 1400 R.P.M. of generator armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0		460	0		440
4		600	4.5		600
9.5		800	10		800
13.5		1000	15		1000
15.5		1400	17		1400

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle on the plate. Shifting the third brush in the direction of generator rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate.

Oiling—Put 4 or 5 drops of light engine oil into generator oiler every week. If car is driven over 250 miles in one week, this care must be given every 250 miles.

RELAY—Relay closes at 7 to 8 miles per hour or 550 to 600 R.P.M. of armature, and opens at 5 to 6 miles per hour or 500 to 550 R.P.M. Relay contacts separate .046-.062 inch. Air gap between relay armature and coil core is .020 to .035 inch.

LAMPS—Head lamps are 6 volts, 21 cp. Auxiliary lamps are 6 volts, 4 cp. Dash and side lamps are 6 volts, 2 cp.

CIRCUIT BREAKER—Circuit breaker begins to vibrate when the current reaches 25 amperes, and continues to vibrate with 3 to 5 amperes.

MOON

MODEL 6-58 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 100 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Place a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "UD" on flywheel opposite indicator in flywheel housing, spark control lever and breaker assembly in the fully retarded position. To set timing, loosen advance lever clamp screw and turn housing in a counter-clockwise direction until the contacts begin to separate. See that rotor is under contact which is connected to cylinder No. 1. Tighten clamp screw after making adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, and the gaps are .030 inch.

STARTER.—Model No. 181. The starter is connected by a Bendix drive to the engine. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., and takes a current of 125-200 amperes at 5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
40-50	5.5	Running Free	4500
450-550	2.75	27 lb. ft.	Lock

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every 1000 miles or each month. Saturate the wick in the oiler on the Bendix gear case once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice a year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band on the commutator end of generator housing, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (clockwise) of rotation. The third brush plate is held in any position by means of a friction clamp. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data

Amperes	R.P.M.
5	700
11	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-550 R.P.M. or 6-8 M.P.H., at 7 volts, and opens at 400-450 R.P.M., with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, contacts fully separated. The air gap is .025-.035 inch, with the contacts fully closed.

LIGHTING.—Combination Switch No. 1239 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary headlights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate, and will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

Plate No. 930

GARDNER

SERIES 5 (1924)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SW-4, 6 volt, 94 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type S. C. Coil Model No. 288,761. Distributor Model No. 290,356. Breaker contacts separate .008 to .012 inch. They are made of tungsten. When the pitting of the contacts affects the ignition, remove and resurface with a medium oil-stone. The bumper of the contact spring is $\frac{1}{8}$ inch off center from the line through the center of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contacts, is required to separate the contacts .020 inch. This spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding and ballast of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is 20° after top dead center, spark control lever and breaker assembly in the fully retarded position. Advance, 30° before top dead center.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER.—Frame Number 100. Style No. 297,903. Rotation of starter armature, looking at commutator end, is counter-clockwise. Starter is connected to engine through a Bendix drive. Starter cranks engine at 115 R.P.M., developing a torque of 2.2 lb. ft.

Starter Test Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4100-4700	5.5	35-45
12 lb. ft.	0	4.0	475

Brush tension should be $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 35-AT. Model 331,328. The direction of rotation, looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system. Maximum current output is 17 amperes, reached at 1500 R.P.M. of armature. Brush tension at $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds per brush.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	500			
8	8.0	750	10	8.0	1200
15-16	8.0	1600			

To increase the charging rate, shift the third brush in the direction of armature rotation and to decrease charging rate shift the brush in the opposite direction.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Westinghouse Model 301,210-A. Relay is mounted on generator frame. Relay closes at 500 R.P.M. of the armature or at 0 to 2 amperes. Relay contacts separate .030 inch to .035 inch. Adjust air gap between relay armature and coil core to .005 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 20 ampere.

REVERE
WESTINGHOUSE STARTING AND LIGHTING SYSTEM
BOSCH IGNITION

Plate No. 931

REVERE

1921, 1922, 1923, 1924

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 776. Starter is connected to the engine through a Bendix drive. Lock torque is 31 pound-feet, current being 750 amperes at 4 volts. The magnetic switch is connected to the relay-regulator in such a manner that it cannot operate after the relay has closed.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 781, Type S-293,478 or N-301,687. Generator voltage regulation is by vibrating regulator. Maximum generator output is 20 amperes at 6.5 volts, reached at 1200 R.P.M. of the armature or 20 miles per hour. Charging rate reduces to 4 amperes as battery becomes fully charged. Shunt field current is 1.4 to 1.6 amperes at 6 volts. Operating freely as a motor, generator takes 5 amperes at 6 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 550-600 R.P.M. of the armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of the armature or 6-8 miles per hour. To adjust the relay, regulate the spring tension until the contacts open with a discharge current of 1 to 3 amperes. Then disconnect the battery and vary the air gap between relay armature (moving member) and coil core by bending the lower prong, until relay contacts just close when a voltmeter connected from the "A" generator terminal to ground indicates 6.5 to 7 volts. This air gap between the relay armature and coil core is .055 to .060 inch. To adjust the regulator, disconnect the wire from the terminal "B" and connect a voltmeter between this post and ground. Operate the engine at a speed corresponding to 20 miles per hour, or drive the generator at 1200 R.P.M., and adjust the spring tension on the regulator armature by turning the thumb screw until the voltmeter indicates 8.75 volts. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Side lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 15 ampere.

DORRIS MODEL 6-80 (1923-24), SERIAL NOS. 9500 UP WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH MAGNETO IGNITION

BATTERY.—Willard, Type SJRN-5, 6 volt, 139 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Type AT-6. Breaker contacts separate .014 to .016 inch. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or worn sandpaper.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—With the piston on top dead center entering power stroke, set breaker contacts to open 10 deg. early with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .018 to .023 inch.

STARTER.—Frame No. 751. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The brush tension of each brush should be from 2½ to 3½ pounds.

Starter Data

2.5 lb. ft.	1450	140
7.5 lb. ft.	1150	200
12.5 lb. ft.	650	400
17.5 lb. ft.	500	530
21.0 lb. ft.	Lock	650

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame No. 760. Generator current regulation is by the third brush system. Maximum current output is 15-17 amperes, reached at 1250 R.P.M. of the armature of 16-20 miles per hour. The direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	450	500	0	725	500
8	675	725	6	850	725
12	840	850	9	1250	850
15-17	1250	1250	12-14	2000	1250
10	2000	2000	7-8	2000	2000

The cold test readings are obtained with a generator temperature under 95° F. The hot test readings are obtained after the generator has been operating 1 hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes when 6 volts pressure is applied to its terminals. When the generator is operating freely as a motor, current is 3.5 to 5 amperes at 6 to 6.3 volts. Generator output is adjusted by shifting the third brush. Shifting the third brush in the direction of armature rotation increases the output and in the opposite direction decreases it.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the dash. Relay closes at 500-550 R.P.M. of the armature or 7-9 miles per hour and opens at 450-500 R.P.M. of the armature or 5-7 miles per hour. Adjust the spring tension on the relay armature so that the contacts open with a discharge current of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Air gap between relay armature and coil core is .005 inch, contacts closed. Contacts separate .030 to .035 inch. Resistance of the shunt coil is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps are 6-8 volt, 4 cp. S.C.

Dash, tonneau, tail, inspection and stop lights are each 6-8 volt, 4 cp. S.C.

FUSES.—Generator field fuse is 5 ampere. All other fuses are 15 ampere capacity.

EARL MODEL 40 (1924) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—U. S. L. Type, HDN, 313X, 6 volts, 95 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Connecticut, Model 16-C. Breaker contacts separate .018 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

Oiling.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model MG-1013. Starter is connected to engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Motor running free at 4000 R.P.M., taking 40-60 amperes, 6 volts. Cranking engine at 125 R.P.M., requiring 150 amperes, 5 volts. Lock torque 13 pounds-feet, current being 450 amperes, at 3-4 volts.

Starter Data		
Torque	R.P.M.	Ampere
2 lb. ft.	1280	135
4 lb. ft.	900	210
6 lb. ft.	600	275
8 lb. ft.	400	335
10 lb. ft.	180	390
13 lb. ft.	Lock	450

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR.—Model GJ-1013. Generator current regulation is by third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 16-18 amperes at 7-7.5 volts.

Cold Test (25°C)			Hot Test (75°C)		
Ampere	Volts	R. P. M.	Ampere	Volts	R. P. M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes when the voltage of the generator reaches 6.5 to 7 volts and opens when there is a discharge of from 0 to 2 amperes. Relay contacts separate .030 to .045 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp., S.C. Dash lamp is 6-8 volt, 2 cp. D. C. Side and tail lamps are 6-8 volts, 2 cp., S.C. Motor lamp, 6-8 volts, 2 cp., D.C.

FUSES.—Fuses are 20 ampere.

COMBINATION SWITCH.—Briggs and Stratton, No. 2267.

CROW-ELKHART

SERIES H AND I. (1923-24)

MODELS 53, 54, 55 AND 56

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY.—Prest-O-Lite, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Connecticut Model 15-T or 16-C. Breaker contacts separate .025 to .027 inch. They are made of tungsten. When the condition of the points affects the ignition, renew the inner breaker mechanism. For temporary service, resurface contacts with fine emery cloth.

OILING.—Model 16-C Ignition. Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles. Do not put grease or oil in the cup.

OILING.—Model 15-T Ignition. Once a month repack the distributor shaft ball bearing with soft cup grease. The bearing is accessible by removing the distributor cap and inner breaker mechanism.

TIMING.—Breaker contacts begin to separate when piston entering power stroke is on top dead center, spark control lever and breaker assembly in fully retarded position.

FIRING ORDER.—The firing order of the 4 cylinder "L" head Lycoming motor is 1, 3, 4, 2. The firing order of the 4 cylinder valve-in-head motor is 1, 4, 3, 2. The firing order of the 6 cylinder car is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. D190. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Ampers	Volt
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

OILING.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C190. Generator current regulation is by the third brush system. Maximum current output is 12-15 amperes, reached at 1200 R.P.M. of the armature, or 20-25 miles per hour.

Generator Data

Ampers	Hot Test	R.P.M.	Ampers	Cold Test	R.P.M.
5.0		600	6		600
10		900	13		900
12		1200	15		1200
11.5		1600	13.5		1600
10.0		2000	11.5		2000

Charging rate is varied by adjusting the third brush setting. Remove the leather plug in the commutator end plate and loosen the exposed screw. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Replace the leather plug after the adjustment is made. Shunt field current is 3.5 amperes at 6.5 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature (moving member) and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Dash and tail lamps are 6-8 volt, 2 cp.

KISSEL SERIES 55 (1924) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJR-4. 6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Model 284-A. Distributor Model No. 626-B. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone. The manual advance is 20°. Automatic advance is 20°.

Oiling.—Turn grease cup two turns and fill oil cup on driving end every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on fly-wheel is 1 1/4 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model 720-D. The direction of rotation, looking at commutator end, is counter-clockwise. Cranking engine at 100-150 R.P.M. it takes 150 to 200 amperes. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
15 lb. ft.	Lock	3.15	570

Starter brush tension should be 20-28 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every month. If car is driven over 1000 miles per month, these attentions must be given every 1000 miles.

GENERATOR.—Model No. 912-B. Direction of rotation, looking at commutator end, is counter-clockwise. Current or voltage regulation is by the third brush and thermostat system. The maximum charging rate is 19-21 amperes, reached at 1800 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
10-13		1800	19-21		1800
			15-18.5		2500

Brush tension is 14 to 18 ounces on all brushes.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—Model No. 264-C. Contacts separate .012 to .015 inch. Air gap between relay contacts and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volts, 6 cp. Dome lamp is 6-8 volts, 6 cp.

FUSES.—All fuses are 20 ampere.

DAVIS

TOURING MODEL, MODEL 81 (1924)

8R CONTINENTAL ENGINE

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJR-3, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION COIL.—Ignition Coil Model No. 2178. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline or soft cup grease to the surface of the breaker cam each 2000 miles. Apply a very small amount of vaseline to rotor track in distributor occasionally during the first 2000 miles. The track will then become glazed and no further lubrication is required. It is only necessary to keep the track wiped with a clean cloth. Repack distributor housing with soft cup grease up to the advance ring and yoke once every season.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated by marking "UD" on the flywheel, at indicator on flywheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug.—The spark plug diameters are 7/8 inch, and the spark plug gaps are .025-.030 inch.

STARTER.—Model No. 181. The starter is connected to the engine by a Bendix. The direction of rotation is clockwise, looking at the commutator end. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 36 amperes at 6 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. Saturate the wick in the oiler on the Bendix gear case with light engine oil once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice each year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature. The third brush system is used for current regulation.

Generator Test Data

Amperes	R.P.M.
5	700
11	1000
14-16 (Max)	1600
15	1800

To adjust the charging rate, remove the cover band and move the third brush mounting plate by means of an extension handle. Shift the third brush in a counter-clockwise direction (direction of rotation) to increase the charging rate, and in the opposite (clockwise) direction to decrease the charging rate. The plate can be held in any position desired by means of friction clamps.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contact closes at 7-8 volts, or 8-10 M.P.H. and opens at 6-7 M.P.H. with a discharge of three amperes. Contact gap is .025-.035 inch, and the air gap between relay armature and coil core is .025-.035 inch.

LIGHTING.—Combination Switch Model No. 1246. The head lights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2cp. All lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate. It will continue to operate with a current flow of not more than the circuit breaker terminals.

OVERLAND

MODEL 91 (1924)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY.—U. S. L. Type CDN-311-X. 6 volt. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4035. Distributor Model IG-4036A. Breaker contacts separate .018 inch, contacts fully separated. If condition of contact points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into the distributor oiler each week. If the car is driven over 250 miles in a week, this must be done each 250 miles.

Timing.—Breaker contacts just open when top dead center mark on flywheel is 2½ inches before reaching dead top center indicator, on compression stroke, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters are ½ inch. Gaps are .025 inch.

STARTER.—Model MG-1001. The direction of rotation looking at commutator end is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Running free at 400 R.P.M., it requires 40-60 amperes at 6 volts. Cranks engine at 125 R.P.M., taking 150 amperes at 5 volts. Lock torque is 16 pound feet taking 600-650 amperes at 3-4 volts.

Oiling.—Put 7 or 8 drops of light engine oil into oil filler hole of the starting motor every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR.—Model GP-4003A. The direction of rotation of the armature looking at commutator end, is counter-clockwise. The third brush system is employed for current regulation. Move third brush in counter-clockwise direction to increase the output and in the opposite direction to decrease the output. The maximum charging rate is 10-11 amperes (generator hot) reached at 1500 R.P.M. of the generator armature or approximately 20-25 miles per hour.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	7.0	375	0	6.5	475
4	7.2	500	4	6.8	640
8	7.4	650	7	7.4	800
12	7.8	875	10	7.6	1200
15	7.9	1225	10.6	7.8	1540
16	8.0	1600	8.2	7.8	2400
13	7.8	2400			

Motoring freely generator draws 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling.—Put 8 or 10 drops of light engine oil into the generator oilers each week. If the car is driven more than 250 miles in a week, this oiling must be done each 250 miles.

RELAY.—Model CB-1078. Relay closes at 325-375 R.P.M. or 7-9 M.P.H. at 7-8 volts and opens at 275-325 R.P.M. of armature, or 5-7 M.P.H., 1-2 ampere discharge. Contact gaps separate .025 to .035. Core gap is .010-.015 inch, contacts closed.

LAMPS.—Head lamps, 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps, each 3-4 volts, 2 cp., S.C.

FUSES.—One 20 ampere fuse is used.

WILLYS-KNIGHT

MODEL 64-67 (1924)
AUTO-LITE IGNITION

BATTERY.—U. S. L., Type 3HVX-8X, 6 volt. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 4035. Distributor Model IG-4036B. Breaker contacts separate .018 inch contacts fully separated. If condition affects ignition, remove and re-surface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into timer distributor each week. If the car is driven over 250 miles in a week, this care must be given every 250 miles.

Timing.—Breaker contacts just open when flywheel is 12° late on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plugs, diameter $\frac{7}{8}$ inch. Gap, .025 inch.

STARTER:—Model MH-4002. Direction of rotation looking at commutator end is counter-clockwise. The starter is connected to engine by a Bendix drive. Motor running free at 4000 R.P.M., takes 40-60 amperes, at 6 volts, cranking engine at 100 to 200 R.P.M., takes 250-300 amperes at 5 volts. Lock torque is 17.5 pound feet, current being 600 amperes at 3-4 volts.

Oiling.—Pour 7 or 8 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR:—Model GJ-4010A. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is used for voltage regulation. Move third brush in counter-clockwise direction to increase the output, and to decrease, in the opposite direction. The maximum charging rate is 12-13 amperes (generator hot) reached at 1700 R.P.M. of the generator armature or approximately 20-25 M. P. H.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.8	500	0	6.8	600
4	7.	580	4	7.3	740
8	7.6	650	8	7.8	950
12	8.	950	11	8.	1200
16.5	8.4	1700	12.7	8.2	1700
15	8.3	2400	11.6	8.1	2400
12.6	8.2	3200			

Motoring freely the generator takes 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling.—Pour 7 or 8 drops of light engine oil into generator oiler once a week. If car is driven more than 250 miles in a week, this care must be given each 250 miles.

RELAY.—Relay closes at 7-9 M.P.H., 500-550 R.P.M., 7-8 volts, and opens at 5-7 M.P.H. 450-500 R.P.M., 1-2 ampere discharge. Contacts separate .025-.035 inch; and air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING.—Clum Combination Ignition and Lighting Switch is used. Head lamps are 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps are 3-4 volts, 2 cp., S.C.

FUSES.—Fuses are 20 amperes.

LAFAYETTE MODEL 1924 DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-LXRV-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2115. Distributor Model No. 5221. Breaker contacts separate .018 inch. Both sets of contacts open at the same instant. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

Oiling.—Put several drops of light engine oil in timer bearing every two weeks. If car is driven more than 500 miles in two weeks, oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever advanced one-third.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER-GENERATOR.—Model No. 187. Starter and generator are combined into one unit but are electrically separate. The starter is connected to the engine by a set of reduction gears and a pinion shifted by the operator. Two overrunning clutches are provided. Depressing the starting pedal opens the generator circuit, meshes the reduction gears and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. Lock torque is 10 pound-feet at 3 volts. The motor running free takes 60 amperes at 6 volts. The brush tension of the motor brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens at 195-200° F., cutting in a resistance, reducing the charging rate about 50 per cent. The maximum charging rate of 18 amperes is reached at 1400 R.P.M. of the armature or 35 M.P.H., car speed in high gear.

Amperes	Motor-Generator Data. No. 187	R.P.M.
Neutral.....		400
6		800
10-12		1000
18		1400

When generator is operating freely as a motor, with overrunning clutch as the only retarding force, the current is 5.5 amperes. To increase the charging rate, move the third brush in the direction of armature rotation. To decrease charging rate, move the third brush in the opposite direction. Reseat the brush after adjusting the position. The tension of the generator brushes should be $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter-generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 3-4 volt, 2 cp. S.C. Dome lamp is 6-8 volt, 4 cp. S.C.

CIRCUIT BREAKERS.—There is a vibrating breaker in the circuit to the head, side, dash and tail lamps, which takes the place of fuses. It requires a current of 25 amperes to start this device vibrating, but when vibrating a current of 3 to 5 amperes will cause it to continue. There is a lockout circuit breaker in the circuit to the horn, tonneau lamp and handy lamp socket. A current of 25 amperes will cause this device to open the circuit.

KURTZ

MODEL 65 (1923-24)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Prest-O-Lite, Type 613-SHC, 6 volt, 100 ampere-hour. The starting capacity is 120 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .012-.016 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a flat jeweler's file. The bumper on the contact spring is 1/8 inch off center from the line through the center of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid stem at the terminal block. A pull of 20-25 ounces, applied to the movable contact, is required to separate the contacts .020 inch. The spring pressure is adjusted by bending the solid stem at the point of contact with the contact spring. Resistance of the primary winding of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil into the distributor oiler on the side of the distributor housing once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .030 inch.

STARTER.—Frame No. 100. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine by a Bendix drive. Cranks the engine at 1600 R.P.M. of armature, taking a current of 145 amperes at 5.5 volts.

Starter Test Data

Amperes	Volts	R.P.M.	Torque
35-45	5.5	4100-7000	0
475	4	Lock	12 lb. ft.

The brush tension should be 1 1/4 to 1 3/4 pounds on each brush.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 760. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, loosen the nut inside of the generator end bracket opposite the third brush. Move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, move the third brush in the opposite direction (clockwise). The maximum charging rate is 14 amperes, reached at 1250 R.P.M. of armature, when the generator is hot.

Generator Test Data

Amperes	R.P.M.
6	725
11-14 (Max.)	1250
7-8	2000

Generator motoring freely takes a current of 3.5-5.0 amperes at 6.0-6.3 volts. The field draws a current of 2.5 amperes at 6.0-6.3 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 7 M.P.H. or 575 R.P.M. of armature, at 6.2-6.5 volts, and opens at 5 M.P.H. or 525-575 R.P.M. of armature. Adjust the spring tension on the relay armature so that the contacts open with a current discharge of 0-3 amperes. Adjust the air gap between the relay armature and coil core so that the contacts close when the voltage of the generator reaches 6.2-6.5 volts. The contact gap is .030-.035 inch, and the air gap between the relay armature and coil core is .005 inch, contacts fully closed. Resistance of the shunt coil is 68 ohms. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before putting into service again.

LIGHTING.—Briggs & Stratton Switch, Model 2367. Head lamps are 6-8 volt, 21 cp. Auxiliary head lamps are 6-8 volt, 4 cp. Dash, tail, side and dome lamps are each 6-8 volt, 2 cp. Stop light is 6-8 volt, 21 cp. All lamps have single contact base.

FUSES.—Generator field fuse is 5 ampere. Lighting fuses are 20 ampere capacity.

PAIGE-DETROIT

MODELS 21-24 (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY:—Westinghouse, Type 6-OB-19. 6 volt, 155 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model N-7, Distributor Model L-A. The breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and scrape with a penknife or resurface on a medium hard oilstone.

Oiling:—Fill oil cup under breaker head with light cylinder oil every two weeks. Apply a small amount of vaseline on the breaker cam once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 is on power stroke, mark "IN-OP-6" on the flywheel is opposite the indicator. Spark control lever and breaker assembly fully retarded.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—The spark gaps are .020-.025 inch.

STARTER:—Model No. 722-A. The starter is connected to the engine through a set of reduction gears and Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is mounted by means of an S.A. E. barrel type mounting.

Starter Test Data

Volts	Amperes	R.P.M. (of Bendix)	Torque
5	70	2500	0 lb. ft.
3.15	570	Lock	28 lb. ft.

The brush tension is 20-28 ounces.

Oiling:—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR:—Model No. 917-V. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. Shift the third brush in the direction of generator rotation to increase the charging rate and in the opposite direction to decrease the charging rate. A thermostat is in series with the shunt field. With the thermostat contacts open the output is cut down approximately 50%.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
7	7.2	850			
19	8.4	1900	11	7.5	1900

Shunt field current is 5 amperes at 6 volts. Brush tension is 22-28 ounces each.

Oiling:—Fill oil cups at each end of the generator housing with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Model 266-F. Relay is mounted on top of the generator. Relay closes at 675 R.P.M. of the generator armature with a generator of 7.25 volts and opens with a discharge current of 0 - 2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LAMPS:—Head and signal lamps are 6-8 volts, 21 cp., S.C. Auxiliary head and dash lamps are 6-8 volts, 4 cp., S.C. Side and tail lamps are 6-8 volts, 2 cp. S.C. Trouble lamp is 6-8 volts, 4 cp., D.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY.—Westinghouse SWB-15, 6 volt. The positive (+) terminal is grounded.

IGNITION.—Coil Type N-3. Distributor Type 2-A. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, gently scrape with a penknife or resurface on a hard oilstone.

Oiling.—Refill the distributor oiler with medium cylinder oil every 100 miles. Also place a small amount of vaseline on the breaker cam at the same time.

Timing.—Breaker contacts begin to separate when piston No. 1 entering firing stroke, and mark I.O.-1-6 is 1½ inches past indicator, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .020-.025 inch.

STARTER.—Model 713A-C. Starter is connected to engine through a Bendix drive. The direction of rotation, looking at commutator end, is counter-clockwise. Brush tension is 24-28 ounces.

Starter Test Data

R.P.M.	Torque	Amperes	Volts
5000	0 lbs. ft.	65	5.0
Lock	12 lbs. ft.	475	3.6

Oiling.—Fill oil cup on each end of starting motor with light cylinder oil every 500 miles.

GENERATOR.—Model No. 913-E. The direction of rotation, looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system and thermostat control. Maximum charging rate is 20 amperes, at 8.5 volts, at 1800 R.P.M. The field draws 5 amperes at 6 volts.

Generator Test Data

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
11	8.2	1900	0	—	675
			7	7.1	825
			20	8.5	1800

To adjust the charging rate, shift the third brush. Moving the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The brush tension should be 16 ounces on each brush.

Oiling.—Fill oil cup at each end of generator with light engine oil every two weeks. If car is driven more than 500 miles in two weeks this care must be given every 500 miles.

RELAY.—Model No. 266-A or 266-B. Relay closes at 6.9 volts or 675 R.P.M. of armature, and opens at 6 volts. Relay contacts separate .014 inch. Air gap between armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface on a hard oilstone.

LAMPS.—Head lamps are 6-8 volt, 21 cp., S.C. Dimmer lamps are 6-8 volt, 4 cp., S.C. Tail lamp is 6-8 volt, 2 cp., S.C. Dash lamp is 6-8 volt, 2 cp., D.C. Dome lamp is 6-8 volt, 4 cp., D.C.

FUSES.—Generator field fuse is 5 ampere. Lighting circuit fuse is 20 ampere.

CLEVELAND

MODEL 42 (1924)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6190. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill the oil cup on the side of the distributor housing with light engine oil. Put one drop of light engine oil on the lever pivot post and place a bit of hard grease on the side of the interrupter block nearest to post. The above instructions must be followed every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—To time ignition, turn the engine over until the flywheel marking "DC 1&6" is directly under the notch cast in the crankcase over the flywheel. Then rotate the flywheel to the right or in a clockwise direction until a point $3\frac{1}{2}$ teeth before dead center is under the notch. With the spark control lever and breaker assembly fully advanced, the breaker contacts should just begin to separate at this point.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .021 inch.

STARTER.—Model No. 900. Direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M., taking 150 amperes. Running free, the current is 45-50 amperes.

Starter Data.—No. 900

Torque	R.P.M.	Amperes
2 lb. ft.	1600	130
6 lb. ft.	600	280
10 lb. ft.	250	410
12 lb. ft.	125	465
15 lb. ft.	Lock	540

The pressure of the brushes on the commutator is 2 pounds.

Oiling.—Oilless bearings are used. No oil is required.
GENERATOR.—Model No. 1021. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate; moving the brush in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes, reached at 1500-1600 R.P.M. of armature or 20 M.P.H., car speed in high gear. When making adjustment of generator, the generator should be cold (50°-80° F. at frame) and battery fully charged. The pressure of all brushes is $1\frac{3}{4}$ to $2\frac{1}{4}$ pounds.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0.0	6.0	520	0.0	6.0	600
7	7.0	800	4	6.6	800

13.6 (Max.)	7.7	1600	9.8 (Max.)	7.3	1600
12.8	7.6	2000	9.6	7.3	2000
11.6	7.4	2400	8.8	7.0	2400
10.0	6.9	2800	7.7	6.6	2800
8.3	6.0	3200	6.0	5.6	3200

Frame temperature—Cold, 20°C.; hot, 85°C.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes when the voltage reaches 6.5 to 7.5 volts, and opens when there is a discharge current of 0-2 amperes. The contacts separate .012 to .014 inch. The air gap between the coil core and the relay armature is .018 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 000 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dash, tail and side lamps are 6-8 volts, 2 cp. With dimmer resistance, head lamps are approximately 2 cp.

FUSES.—Lighting fuse is 20 ampere. Generator fuse is 5 ampere.

SUPERIOR MODEL (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Exide, Type 3-XC-13-1, or Willard, Type SJXR-3, 6 volt, 90 ampere-hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plug gaps are .025 inch.

STARTER.—Model 711-B. The direction of rotation, looking at commutator end, is counter-clockwise. Starter is connected to motor by a Bendix drive. Cranks the at 160 R.P.M. taking 140 amperes. Starter brush tension should be 20-24 ounces each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
10 "	Lock	3.5	425

Oiling.—Put 4 or 5 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model 950-A. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for voltage regulation. The maximum charging rate is 18 amperes reached at 1800 R.P.M. of the generator armature. Brush tension is 14-18 ounces each. Shunt field current is 5 amperes at 6 volts.

Generator Test Data					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	640			
7	7.73	880	12-15	8-8.5	1750
15-17	8.3-8.8	1750			
8.5-15.5		2500			

To adjust the generator charging rate, loosen the generator cover band and the screw on the generator end plate. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Tail and coil lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

FUSES.—One fuse is used; 20 amperes.

CLIMBER

MODELS T AND K (1924)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten.

When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter $\frac{7}{8}$ inch. Spark plugs are .030 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 130 R.P.M., taking 250-300 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4100-7000	35-45	5.5
1.75 lb. ft.	1600	145	5.5
12 lb. ft.	Lock	475	4.0

Pressure of brushes on the commutator is $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes at 900-1400 R.P.M. of the armature 20-25 miles per hour.

Amperes	Generator Data	R.P.M.
0		375
8		550
15-17		900-1400
7-11		2500
11-13	Hot Test	1200

Field winding takes 3.25 to 3.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 6 amperes at 6 to 6.3 volts. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 375-425 R.P.M. of the armature or 8-10 miles per hour and opens at 350-375 R.P.M. of the armature or 6-8 miles per hour. Adjust relay spring tension so that contacts open with a discharge current of 0-3 amperes from the battery. Adjust armature stop (which determines the air gap between the relay armature and coil core) so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Contacts separate .030 to .035 inch. Air gap between relay armature and coil core is .005 inch, contacts closed. Resistance of the shunt winding is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 v lt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp. Tail lamp has single contact base. All others have double contact base.

Plate No. 945

Plate No. 946

WESTCOTT **MODEL B-44 (1923)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY.—Willard, Type SJRN-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5208. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor unit oilers every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. Starter is connected to the engine through a set of reduction gears and a Bendix drive. Lock torque is 28 pound-feet at 4 volts, the current being 525 amperes. Starter running free takes 30 amperes at 6 volts. The brush tension should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds for each brush. The direction of rotation is clockwise, looking at the commutator end.

OILING.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month. Remove the grease plug in the reduction gear housing and inject soft cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 165. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

Charging rate is varied by the adjustment of the third brush setting. To move the third brush, loosen the three screws holding the bearing retainer plate on the commutator end and shift the plate. Move in a counter-clockwise direction to increase the charging rate, or in the opposite direction to decrease the charging rate. Tighten the adjusting screws and reseal the brush after making the adjustment. Maximum charging rate must not exceed 16 amperes.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb nut until the contacts close when the voltmeter indicates 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 3-4 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 3-5 amperes.

Plate No. 947

WESTCOTT

MODEL C-44 (1923)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file, finishing on a hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in each of the distributor oilers every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Place a bit of medium heavy cup grease on the face of the breaker cam. These attentions should be given every 500 miles or each two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. The starter is connected to the engine by a Bendix drive. Lock torque is 27 pound feet at 2.75 volts. Starter running free takes 36 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The brush tension should be from 2 1/4 to 2 3/4 pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Remove the grease plug and repack the reduction gear housing with medium heavy cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil once each year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the armature.

Generator Data

Amperes	R.P.M.
4.....	800
8.....	1000
17.....	1600
15.....	2000

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the third brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of the generator brushes should be from 1 1/4 to 1 3/4 pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—The relay is mounted on the generator frame. The relay contacts close at 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The gap between the relay armature and the coil core is .015 to .020 inch. To raise the cut-in voltage, increase the spring tension by bending the long brass stop or increase the gap by bending the short brass stop. To lower the cut-in voltage, decrease the gap or the spring tension.

LAMPS.—Combination Switch No. 1246. Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 3-4 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp.

CIRCUIT-BREAKER.—A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25 to 30 amperes to start it vibrating. While vibrating the current is 3-5 amperes.

MODEL 60 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, Type SW-15. 6 volt, 120 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5257. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file, finishing on a hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in each of the distributor oilers every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Place a bit of medium heavy cup grease on the face of the breaker cam. These attentions should be given every 500 miles or each two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is 1 inch past top dead center (measured on the flywheel), spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 278. The starter is connected to the engine by a Bendix drive. Lock torque is 20 pound feet at 3.1 volts. Starter running free takes 65 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The brush tension should be from 2¼ to 2¾ pounds on each brush.

Oiling.—Oilless bearings are used. They require no attention. Remove the grease plugs and repack the reduction gear housing with medium heavy cup grease twice a year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the armature.

Generator Data

Amperes	R.P.M.
4	800
8	1000
17	1600
15	2000

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the third brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of the generator brushes should be from 1¼ to 1¾ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—The relay is mounted on the generator frame. The relay contacts close at 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The gap between the relay armature and the coil core is .015 to .020 inch. To raise the cut-in voltage, increase the spring tension by bending the long brass stop or increase the gap by bending the short brass stop. To lower the cut-in voltage, decrease the gap or the spring tension.

LAMPS:—Combination Switch No. 1244. Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25 to 30 amperes to start it vibrating. While vibrating the current is 3-5 amperes.

BEGGS

MODEL 20 (1922-23-24)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY:—Exide, Type 3-XC-13-1. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER:—Model MH-1025. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter clockwise, looking at the commutator end.

Starter Data				
Torque	R.P.M.	Volts	Amperes	
0 lb. ft.	4000	6.	40-60	
1.3 "	1500	5.5	100	
5 "	800	5.	200	
9 "	400	4.5	300	
17.5 "	Lock	4.	600	

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model GJ. Generator current regulation is by the third brush system.

Cold Test. (25°C)			Hot Test (75°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

Maximum charging rate is reached at 20-25 miles per hour or 1600-1700 R.P.M. of the armature.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 6-9 miles per hour or 550-600 R.P.M. of the armature and opens at 4-7 miles per hour or 500-550 R.P.M. of the armature. Charging current is 1-3 amperes at closing, and discharge current 5 to 1.5 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 3-4 volt, 2 cp.

SAYERS AND SCOVILL
Model GL (1924)
Delco Generating, Starting, and Lighting System
Delco Ignition

Plate No. 950

BATTERY.—Willard, Type SJRN-5, 6 volts, 110 ampere-hour capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5208. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweller's file. It is not necessary to grind the contact points if burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once a season. Apply a little vaseline to the rotor track occasionally during the first 2000 miles, after this, the track will be glazed, and it will be necessary to keep the track wiped clean with a clean cloth. Apply a very small amount of vaseline about the size of a match head to the surface of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 on compression stroke is at top dead center, mark "UD" on flywheel is opposite indicator on fly-wheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gap is .030 inch.

STARTER.—Model No. 200. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. When running free the starter takes 50 amperes at 6 volts. Lock torque is 24 pound feet at 2.75 volts. The tension on each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off the commutator. Keep dirt and grit off of Bendix drive to insure perfect operation. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator, remove the cover band, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
5.....	700
11.....	1000
16-18.....	1600
15.....	2000

The tension of each of the generator brushes should be from 1 1/4 to 1 3/4 pounds.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-9 M.P.H. or at 7-8 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, fully separated. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Combination Switch Model No. 1246 is used. The head lights are each 6-8 volt, 32 cp. Auxiliary and side lamps are each 6-8 volt, 4 cp. Stop light is 6-8 volt, 15 cp. Dash, tail, dome and tonneau lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the combination switch is used in the place of fuses. A current flow of 25-30 amperes will cause circuit breaker to operate, and it will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

CHRYSLER SIX

MODEL B (1924) SERIAL NOS. 1001 UP.

REMY GENERATING, STARTING AND LIGHTING SYSTEM **REMY IGNITION**
BATTERY.—Westinghouse, Type 6-C-13, 6 volt, 105 ampere-hour. The starting capacity is 109 amperes for 20 minutes. The lighting capacity is 5 amperes for 21 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284A. Distributor Model 616F. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone.

Oiling.—Refill the grease cup under the distributor head with soft cup grease and turn down one turn every two weeks. Place a very small amount of vaseline on the surface of the breaker cam and wipe out the distributor head with a clean cloth every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position 20 deg. before top dead center (measured on the flywheel) when the flywheel marking "AD-SP" is opposite the indicator mark on the clutch housing with the spark control lever and breaker assembly in the fully advanced position. To set timing, crank the engine until piston No. 1 reaches this position. Then loosen the clamp screw which holds the timing lever to the distributor and after fastening the lever to the bracket on the cylinder head, rotate the distributor in a clockwise direction until the breaker contacts begin to separate. Tighten the clamp screw and replace the rotor and distributor head.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER.—Model 722-B. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 115 R.P.M., taking 125 amperes at 5.48 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0	2500	70	5.
5.6 lb. ft.	660	200	5.2
10.7 lb. ft.	365	300	4.6
16.8 lb. ft.	200	400	4.0
28 lb. ft.	Lock	570	3.15

Starter brush tension should be 20-28 ounces each.

Oiling.—Put a few drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. 917-T. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18-20 amperes (generator cold) reached at 1900 R.P.M. of the armature or 24-26 M.P.H., car speed in high gear.

Generator Test Data

Amperes	Hot Test Volts	R.P.M.	Amperes	Cold Test Volts	R.P.M.
9-12	8.0-8.5	1900	18-20	7.1	850
				8.3-8.5	1900

To adjust the generator output, remove the commutator cover band and loosen the third brush ring clamp screw. Then move the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and the opposite (clockwise) direction to decrease the charging rate. Tighten the screw after making the adjustment. Motoring freely at 350 R.P.M. generator 5.1 amperes at 5.55 volts. Shunt field current is 4-5.9 amperes at 6 volts. Generator brush tension should be 22-28 ounces each.

Oiling.—Put a few drops of light engine oil in each of the generator bearing oilers every 1000 miles or each month.

RELAY.—Model No. 265A-B. Relay closes at 675 R.P.M. of the generator at 10.5 M.P.H. with a generator voltage of 7.2 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING.—Combination Switch Model No. 474-A. Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dash, tail and side lamps are each 6-8 volt, 2 cp. S.C. Dome lamp is 6-8 volt, 4 cp. S.C.

FUSES.—Lighting circuit fuses are 10 amperes capacity.

NOTE.—Connections as shown are for closed cars. On open cars the dotted connection takes the place of the line A-5.

MAXWELL
Model 25 (1924)
Remy System.

Plate No. 952

MAXWELL

MODEL 25 (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—Westinghouse, Type 6-OB-13. 6 volt, 105 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 21 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 284-L, Distributor Model No. 369C. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface them on a medium hard oilstone.

Oiling:—Fill distributor grease cup with soft grease and turn down two or three turns once a month. If car is driven over 1000 miles in a month, this attention must be given once to every 1000 miles.

Timing:—Contact points begin to separate when No. 1 piston is $\frac{3}{64}$ of an inch past top dead center on power stroke; as measured on flywheel is 10 degrees past top dead center, spark control lever and breaker assembly fully retarded. To adjust points to open at this position, loosen clamp which locks sparks lever to distributor head, and rotate distributor head until points begin to open with rotor under segment connected to spark plug No. 1.

Firing Order:—The firing order is 1, 3, 4, 2.

Spark Plugs:—Spark plug diameters $\frac{7}{8}$ inch. Gaps are .027-.030 inch.

STARTER:—Starter Model 712-A. The direction of rotation is counter-clockwise, looking at commutator end. The connection to engine is by a Bendix drive. The motor running free at 4000 R.P.M., taking 50-60 amperes, 6 volts. Cranking engine at 150 R.P.M. Lock torque is 11 pound feet taking 450 amperes at 3.6 volts.

Oiling:—Put 4 or 5 drops of light engine oil into starter oiler once a month. If car is driven over 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR:—Model No. 951-C. The direction of rotation looking at the commutator end is counter-clockwise. Generator running freely at 440 R.P.M. takes 6.5 amperes at 7.1 volts. Shunt field current is 5 amperes at 6 volts. The third brush system is used for current regulation. To adjust generator output, loosen locknut on outside of generator end plate and shift the third brush. Moving the brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the output. Before adjusting charging rate, make certain that fan belt is not slipping. If the fan moves even part of a revolution when the relay points are closed or if a higher speed than 20-25 M.P.H. is required to reach the maximum charging rate the fan belt is loose and slipping.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
7	7.1	925			
15-17	8.1	1800	11	7.85	1975

Generator brush tension should be 22-28 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles or each month.

RELAY:—Relay points close 8-10 M.P.H., 7 volts; and opens at 7-8 M.P.H., 0-3 amperes discharge. Relay contacts separate .014-.025 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Head lamps are each 6-8 volt, 21 cp. S.C. Dash, tail and stop lamps are 6-8 volt, 2 cp. S.C. Dome and side lamps are each 6-8 volt, 4 cp. S.C.

FUSES:—Fuses are 20 amperes.

ANDERSON **MODEL 50 (1924)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM** **REMY IGNITION**

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine flat, jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 705-A. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 250 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10000	65	5.0
1 lb. ft.	3000	145	5.4
4 lb. ft.	1000	310	4.5
5 lb. ft.	800	350	4.4
12 lb. ft.	Lock	600	3.0

Above tests are made without the reduction gears.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 234-E. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit at a temperature of 175°F., reducing the charging rate 6 amperes. The thermostat is intended to change the charging rate as the demands of seasons or car operation requires. Never touch the thermostat points. Maximum current output is reached at 2000 R.P.M. of the armature or 28 miles per hour.

Generator Data

Amperes	R.P.M.	Volts
0	525	6.4
7	780	7.1-7.2
19.5-20.5	1680	8.6
14	1100	7.8
19.0-20.0	2000	8.6
13.0-15.0	3000	8.0

Field winding takes 5 amperes at 6.4 volts. Pressure of main brushes on commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces. Position of third brush is adjusted by turning a screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 525-575 R.P.M. of the armature and opens at 7-9 miles per hour or 475-525 R.P.M. of the armature. Relay contacts separate .012-.015 inch. Air gap between relay armature and coil core is .012-.015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 5 ampere.

ANDERSON

 Remy System

Plate No. 953

ANDERSON

MODEL 41 (1924)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volts, 111 ampere-hours capacity. The positive (+) terminal is grounded.

IGNITION.—Type SC. Coil Model No. 288,761. Distributor Model No. 303,018. Breaker contacts separate .011 to .015 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium oilstone.

Oiling.—Place 4 or 5 drops of light engine oil into the oiler on the outside of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—The breaker contacts begin to separate when the top dead center mark on the flywheel is one-half of an inch past indicator. The spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Frame No. 711. Model No. 355,708. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R.P.M., taking 145 amperes. Lock torque is 17 pound-feet, current being 525 amperes, 4.0 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
2.5 lb. ft.	1250	150	5.5
17.0 lb. ft.	0	525	4.0

Brush tension is 2.5 to 3.0 pounds.

Oiling.—Fill the oil cups with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No 36-ATI, Style No. 355,705. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is employed for current regulation. The maximum charging rate is 16 amperes, reached at 1450 R.P.M. of armature or 28 miles per hour, car speed in high gear.

Generator Test Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	625	6.5	0	475	6.5
7	950	6.6	8	750	8.0
11	1450	7.7	15-16	1450	8.0

The brush tension is 20-24 ounces.

Oiling.—Place 4 or 5 drops of light engine oil in the generator oil cups every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 302,210. Relay closes at 7.85 M.P.H., or 475 R.P.M. of armature, and opens at 6.7 M.P.H., or 405 R.P.M. The relay contacts separate .035 to .050 inch. The air gap between armature and coil core is .014 to .017 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volts, 21 cp. A dimmer resistance is used. Dash, tail and dome lamps are 6-8 volts, 2 cp.

FUSES.—Generator fuse is 5 amperes. Lighting fuse is 15 amperes.

ANDERSON
Model 41 (1924)
Westinghouse Systems

Plate No. 954

WILLS SAINT CLAIRE

MODEL B-68 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5235. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oil-stone. Two sets of contacts are provided. They operate with a four sided cam and open separately. Each breaker cam controls one coil and fires one bank of cylinders. The distributor is provided with manual and automatic advance. Manual advance is 45-50°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-22° at 2000 R.P.M. The breaker arm spring tension is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of medium heavy grease on the breaker cam and on the track in the distributor head every 1000 miles. After polishing the rotor track with a clean cloth, remove all excess grease.

Timing.—Breaker contacts firing right bank of cylinders begin to separate when piston No. 1 entering power stroke reaches a position 7° past top dead center (measured on flywheel) with the spark control lever and breaker assembly in the fully retarded position. This position is reached when the flywheel marking EC-1 is slightly past the indicator. Breaker contacts firing the left bank open when piston No. 8 reaches a similar position. The engine fires at intervals of 60 and 120° corresponding to 30 and 60° of distributor travel. These intervals must be accurately set. This may be done by connecting a test lamp in each circuit and noting the exact moment the contacts separate. If small scratches are made on the distributor housing opposite the rotor when the contacts separate the firing intervals can be measured. The straight line distances between the marks should be 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Firing Order.—Right hand bank of cylinders are numbered 1-2-3-4 from the radiator. Left hand bank are 5-6-7-8. Firing order is 1-8-2-7-4-5-3-6.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

MOTOR-GENERATOR.—Model 207. Starter cranks the engine at 100 R.P.M. Current required to break away engine is 265 amperes. While cranking the current is 50-75 amperes. Rotation is clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 lb. ft.	Lock	3	—

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens 190-200° F., cuts in Res., reducing charging rate 50 per cent.

Generator Data—No. 207

Amperes	Cold	R.P.M.	Amperes	Hot	R.P.M.
0	575-600	0	750-800		
8-10	1000	1-2	1000		
16-18	1500	6-8	1500		
18-20	2400	11-13	2400		

To adjust the charging rate, loosen cover band and locknut on the generator commutator end and shift the third brush mounting plate by means of the handle. To increase the charging rate shift the third brush in the direction of armature rotation and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Every 1000 miles apply heavy grease to starting gear shaft through fitting in rear end of shaft and apply heavy oil to the generator clutch through oiler in top of housing. Once each year remove, disassemble and clean generator and motor clutches. Repack with vaseline.

RELAY.—There is no relay. The circuit between the battery and generator is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Switches.—Combination switch is Model 1259.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25-30 amperes to start this device. While vibrating the current is 10-15 amperes.

OAKLAND

MODEL 6-54 (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM.

REMY IGNITION.

BATTERY: — Prest-O-Lite, Type 613-RHN, 6 volt, 100 ampere hours. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. 284-L. Distributor Model No. 616-G. Breaker contacts separate .020 to .028 inch. They are made of tungsten. When the condition of the points affected the ignition, resurface with a fine contact file.

OILING: — Refill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Remove the rotor and saturate the wick in the oiler on the distributor shaft with light engine oil every 1000 miles or each month. Place a small amount of vaseline on the face of the breaker cam, applying with a toothpick.

TIMING: — Breaker contacts begin to separate 5° before top dead center. The spark control is of the fully automatic type, no manual advance being provided. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. Then mount the distributor so that with the indicator pointing to the center of the scale (0 position) the breaker contacts are just beginning to separate. Then rotate the housing 5°, or one half of one division on the clamp scale, in a counter-clockwise direction (opposite to direction of rotation). When this position is reached, clamp the distributor in the mounting.

FIRING ORDER: — The firing order is 1,5,3,6,2,4.

SPARK PLUG GAPS: — The spark plug gaps are .025 to .030 inch.

STARTER: — Model No. 713-B. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is clockwise, looking at the commutator end.

Starter Test Data.

Torque.	R. P. M.	Volts.	Amperes.
0	5000	65	5.
12	Lock	475	3.6

The tension of the starter brushes should be from 20 to 28 ounces each. The starting switch model is 406-A.

OILING: — Put 5 or 6 drops of light engine oil in the oiler at the commutator end of the motor every 1000 miles or each month. At the same time fill the connection on the drive end by means of a pressure oil gun.

GENERATOR: — Model Nos. 917-K & 917-S. Generator current regulation is by means of the third brush system. A thermostat located in the field circuit of the generator inserts a resistance in the shunt field at a temperature of 195°-200°F. which reduces the charging rate by approximately one half. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18-20 amperes at 8.3-8.5 volts reached at 1900 R. P. M. of the generator.

Hot Test. Generator Test Data. Cold Test.

Amperes	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0			0		675
7	7-7.3	850	7	7-7.3	850
9-12	8-8.5	1900	18-20	8.3-8.5	1900

To adjust the generator output, loosen the screw exposed in the commutator end plate and shift the third brush mounting plate. Move the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The field draws 4 to 5.9 amperes at 6 volts. The brush tension should be 14-18 ounces on 917-K generator and 22-24 ounces on the 917-S model.

OILING: — Put 5 or 6 drops of light engine oil in the oiler at the commutator end of the generator every 1000 miles or each month.

RELAY: — Model 265-A and 265-B. The relay is mounted on top of the generator. Relay contacts close at 675 R. P. M. of the generator with a voltage of 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes on the model 265-A and 0 to 2.5 amperes on the model 265-B relay. Relay contacts separate .010 to .016 inch on the model 265-A and .015 to .025 inch on the model 265-B. Clean relay contacts by drawing unglazed paper between them. If they are badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS: — Combination Switch Model Nos. 481-A and 481-B. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

OAKLAND
Model 6-54 (1924)
Remy System.

Plate No. 956

MODEL V, SERIES 5 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, SJRN-5, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2135. Distributor Model No. 5218. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 5 or 6 drops of light engine oil in the ignition unit oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Once each year remove the grease plug on the side of the distributor housing and repack the housing with medium heavy cup grease.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is 5 deg. past top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plugs.—Spark plug gaps are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model No. 183. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to engine by a Bendix drive. Starter running free at 4000 R.P.M. takes a current of 60-70 amperes, 5.5 volts. Cranking the engine at 150 R.P.M. requires a current of 125-200 amperes, 5 volts. Lock torque is 24 lb. ft., current being 450-550 amperes at 2.75 volts. The starter brush tension should be $\frac{2}{4}$ to $\frac{3}{4}$ pounds each.

OILING.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. 182. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band and loosen the lock nut on the end of the generator. Then turn the third brush plate adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the lock nut after making the adjustment. The maximum charging rate is 18 amperes, reached at 1000 R.P.M. of the armature or 24 miles per hour. Generator motoring freely takes 3-5 amperes at 6 volts. Field current is 2 amperes at 6 volts.

Generator Test Data
(Hot Test)

Amperes	R.P.M.	M.P.H.
0	450	
10	800	
18	1000	24
10-14	1450	
13	1800	

The tension of each of the generator brushes should be from $\frac{1}{4}$ to $\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 10 miles per hour or 400 R.P.M. of the armature, and opens at 8 miles per hour or 320 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltage of the generator reaches 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash lamps are each 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will start this device vibrating. While vibrating, the current is 10-15 amperes.

MODEL 6-24 (1924)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Prest-O-Lite, Type 613 S.H.C., 6 volts, 100 ampere-hour capacity. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. The negative (-) terminal is grounded.

IGNITION.—Coil Model No. 284-L. Distributor Model No. 626-H. The breaker contacts separate .020-.025 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. It is not necessary to grind the contact points if they are burned or pitted. Just brighten up the point and remove the raised portion of the opposite point.

Oiling.—Fill grease cups with medium soft cup grease and turn down every two weeks. Apply a very small amount of vaseline on the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded, or 15° early before reaching top dead center, measured on flywheel, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.035 inch.

STARTER.—Model No. 720-L. The starter is connected to the engine by an out-board Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. The starter is mounted with a No. 2 S. A. E. flange.

Starter Test Data.

Torque	Amperes	Volts	R.P.M.
0 (Running Free)	65	5.00	6000
15 ft. lbs.	570	3.15	0 (Lock)

The brush tension is 20-28 ounces.

Oiling.—Fill the oil cup with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off of commutator, and dirt, grit and oil off Bendix drive to insure perfect operation.

GENERATOR.—Model No. 917-L. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system and thermostatic control are used for current regulation. To increase the current output, shift the third brush in the direction of rotation (counter-clockwise). To decrease the generator charging rate, shift the third brush in the opposite direction (clockwise). The thermostat is automatic.

Generator Test Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0		675 (Relay cut in)	9-12 (Max.)		1800-2000
7	7.0-7.3	850			
18-20 (Max.)	8.4	1900			
10-17		2500			

The brush tension is 14-18 ounces. The generator field draws a current of 5 amperes at 6 volts.

Oiling.—Fill oil cups at each end of the generator housing every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 265-A. Relay closes at 9-10 miles per hour, car speed in high gear, or at 675 R. P. M. of armature. The relay contact points separate .010-.016 inch, contacts fully separated. The air gap between relay armature and coil core is .010-.020 inch, relay contacts fully closed. Clean relay contact points by drawing unglazed paper between them. If the same are badly pitted or burned, remove and resurface on a medium hard oilstone.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Headlights when dimmed are 4 cp. Dash, dome, cowl, tail and tonneau lights are each 6-8 volts, 2 cp.

FUSES.—All fuses are 10 amperes capacity.

APPERSON

MODEL 8-23 & 8-24 (1923-24).

BIJUR GENERATING, STARTING AND LIGHTING SYSTEM.

REMY IGNITION.

BATTERY: — Prest-O-Lite, Type 613-SHC, 6 volt, 100 ampere hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. The negative (-) terminal is grounded.

IGNITION — Coil Model No. 284-H. Distributor Model No. 367-C. The breaker contacts separate .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file.

OILING: — Fill grease cup with medium soft cup grease and turn down two turns every two weeks. Put a very small amount of vaseline on the surface of the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING: — Breaker contacts begin to separate when piston No. 1 is on top dead center on compression stroke, spark control lever and breaker assembly in the fully retarded position; or 15° before reaching top dead center (measured on the flywheel) with the spark control lever and breaker assembly fully advanced.

FIRING ORDER: — The firing order is 1, 6, 3, 5, 4, 7, 2, 8. (Cylinders are numbered 1, 2, 3, 4 from the radiator on the right hand block, viewed from drivers seat, and 5, 6, 7, 8 on the left hand block).

SPARK PLUG GAPS: — The spark plug gaps are .030 inch.

STARTER: — Model ED-160, M-1729. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter running free at 6500 R. P. M. takes 35 amperes at 6 volts.

Starter Test Data.

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	6500	6.	35
2	2000	5.4	125
6	1000	4.8	275
8	700	4.5	350
10	450	4.25	440
16	Lock	3.5	600

The tension of each of the starter brushes should be 24 ounces.

OILING: — Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

GENERATOR: — Model L-220, M-1731. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise looking at the commutator end. To adjust the charging rate, remove the commutator cover band and loosen the 8/32 lock nut that holds the third brush bracket stationary. Then shift the third brush bracket in the direction of rotation (counter-clockwise) by means of the screw to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 12-14 amperes reached at 1400 R. P. M. of the generator armature.

Generator Test Data.

Cold Test (100°F)			Hot Test (200°F)		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0	7.5	400	0	7.5	500
6	8.1	625	6	8.1	725
10	8.3	900	10	8.3	1000
12	8.5	1100	12	8.5	1200
7	7.9	3200	7	7.9	3300

Motoring freely the generator makes 380 R. P. M. taking 5-6 amperes at 6.1 volts. The shunt field draws 5.1 amperes at 6.1 volts. The tension of each of the generator brushes should be 20 ounces.

OILING: — Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY: — Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 6.7 volts and open with a discharge current of 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature (moving member) and coil core is .015 inch, contacts closed.

LIGHTING: — Bijur Switch, Model No. T161-M865. Head lights are 6-8 volt, 21 cp. Dash, tail, tonneau and dome lights are each 6-8 volt, 2 cp.

FUSES: — Generator field fuse is 10 ampere. No other size fuse should be used to replace it.

Remy Ignition

Plate No. 959.

PREMIER

MODEL 6-D-24 (1924). SERIAL NOS. 8001 UP
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 613-SHC, 6 volt, 100 ampere-hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or on the flat side of an emery wheel finishing on a hard oil stone.

Oiling.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the flywheel is 1½ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug diameters are 7/8 inch. Gaps should be .025-.028 inch.

STARTER.—Model No. 194. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 120 R.P.M., taking 75 to 175 amperes at 5 volts. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
0	4500	5.5	40-50
16 lb. ft.	0	3.4	450

Oiling.—Self oiling graphite bushings are used.

GENERATOR.—Model No. 195. Generator current regulation is by the third brush system, direction of rotation being counter-clockwise, looking at commutator end. The maximum charging rate is 16 amperes, reached at 1200 R.P.M. of the armature or 17 miles per hour, car speed in high gear. Motoring freely, the generator takes 3.5 amperes at 6 volts. The field current is 2 amperes at 6 volts.

Generator Test Data.

Amperes.	Volts	R. P. M.
3	6.6	600
6	6.8	700
9	7.0	800
11.5	7.2	900
17.5	7.5	1400

To adjust the charging rate, loosen the three screws which hold the third brush mounting plate and shift the third brush. Shift the brush in the direction of generator rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on generator frame. Relay closes at 8-9 and opens at 5-7 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by turning the thumb screw until the relay contacts close when the voltmeter indicates 7.5 volts.

LIGHTING.—Combination Switch Model No. 1155. Head lamps are 6-8 volt, 20 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Dome lamp is 6-8 volt, 4 cp. D. C. Stop lamp is 6-8 volt, 20 cp. S. C. Dash, tail and tonneau lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

Delco System

Plate No. 960

ELCAR

MODEL 4-40 (1923-24).

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY: — Willard, Type SW-4. 6 volt, 90 ampere-hour. The negative (—) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5261. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING: — Put 8 or 10 drops of light engine oil in the oiler at the side of the distributor head every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the track of the rotor button is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING: — Breaker contacts begin to separate when piston No 1 reaches top dead center on compression stroke when the flywheel marking "1-4" is under the indicator with the spark control lever and the breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER: — Model No. 263. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Lock torque is 12 lb. ft. at 2.75 volts. Running free the starter takes 50 amperes at 6 volts. The tension of each of the starter brushes should be $\frac{2}{4}$ - $\frac{2}{4}$ pounds.

OILING: — Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

GENERATOR: — Model No. 265. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

To adjust the charging rate, loosen the commutator cover band and shift the third brush mounting plate by means of the handle attached. Move the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate must not exceed 17-19 amperes.

OILING: — Put 4 or 5 drops of light engine oil in the oiler at the commutator end of the generator every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by bending the long brass stop until the contacts close when the voltmeter indicates 6.75 to 7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS: — Head lamps are 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Stop lamp is 6-8 volt, 15 cp. S. C. Dome lamp is 6-8 volt 4 cp. S. C. Dash lamp is 6-8 volt, 2 cp. D. C. Tail, tonneau and side lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER:—A circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will start this device vibrating. While vibrating, the current is 10-15 amperes.

ELCAR

Delco System.

Plate No. 962.

ELCAR MODEL 6-60 (1923-24) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY: — WILLARD, TYPE SJR-3, 6 volt, 100 ampere-hour. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING: — Put 4 or 5 drops of light engine oil in the oiler at the side of the distributor head every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING: — Breaker contacts begin to separate when the top dead center mark on the flywheel is $1\frac{3}{8}$ inches past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER: — Model No. 181. Starter is connected to the engine through a Bendix drive. Lock torque is 28 lb. ft. at 4 volts, the current being 525 amperes. Running free the starter takes 36 amperes at 6 volts. The tension of each of the starter brushes should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds.

OILING: — Put 5 or 6 drops of light engine oil in each of the starter oilers every month. Remove the plug in the reduction gear case and inject soft cup grease every six months.

GENERATOR: — Model No. 258. Rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 11-15 amperes, reached at 1200 R.P.M. of the armature or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		550
4		800
8		1000
11-15		1200
11-14		2000

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate should not exceed 17 amperes. The tension of each of the generator brushes should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds.

OILING: — Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY: — Relay is mounted on the generator frame. Relay closes at 550-600 R.P.M. of the armature or 7-8 miles per hour, and opens at 500-550 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between the relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay connect a voltmeter between the positive (+) generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension by bending the long brass stop until the relay contacts close when the voltmeter indicates 6.75-7.5 volts. Clean relay contacts by drawing unglazed paper between them. If badly burr'd or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS: — Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Stop lamp is 6-8 volt, 15 cp. Dash, tail and side lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER: — A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating, the current is 10-15 amperes.

CASE

MODEL Y (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRG-5, 6 volts, 135 ampere-hour capacity. The starting capacity is 140 amperes for 20 minutes. The lighting capacity is 5 amperes for 22½ hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5251. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Every 1000 miles put a small amount of medium heavy cup grease on the surface of the breaker cam and polish the distributor head with a soft clean cloth.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded. Locate the breaker cam carefully, so that when the backlash in the distributor gears is rocked forward the contacts will open, and when the backlash in the gears is rocked backward the contacts will just close. The distributor shaft rotates clockwise when viewed from the top.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—Spark plug diameters are ⅞ inch. Gaps are .025 inch.

STARTER.—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M. taking 275 amperes at 4 volts.

Starter Data

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	4000	6	36
27 lb. ft.	Lock.	2.75	500

Starter brush tension should be 2¼ to 2¾ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. Saturate the wick oiler in the Bendix gear case with light engine oil once each year. Every six months remove the grease plug and repack the reduction gear case with medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the charging rate, move the third brush in the direction of rotation (counter-clockwise) and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 15-17 amperes, reached at 1600-1800 R.P.M. of the armature or 22-27 miles per hour. The main brush tension should be 25-30 ounces and the third brush tension, 20-30 ounces.

Generator Test Data

Amperes	Volts	R.P.M.
0 (Cuts in)	7-7.5	650
4.5		800
13-17 (Max.)		1600
9-12		2300

Generator motoring freely takes a current of 4 amperes, at 6 volts, at armature speed of 450 R.P.M. The field draws a current of 3 amperes, at 5 volts.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every two weeks.

RELAY.—Relay closes at approximately 8-9 M.P.H. or 650 R.P.M. of armature, and opens at approximately 550-600 R.P.M. of armature or 6-8 M.P.H., with a current discharge of 0-3 amperes. The contact gap separates .046-.062 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING.—Delco Combination Switch Models No. 1246-1257. Head lights are each 6-8 volts, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Side lamps are each 6-8 volt, 4 cp. Signal lamp is 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp. Ton-neau lamp is 6-8 volt, 4 cp.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current of 25-30 amperes, and will continue to operate with a current flow not exceeding 15 amperes.

Plate No. 964.

OLDSMOBILE

MODEL 30 (1924).

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY: — Willard, Type XW-13, 6 volt, 80 ampere-hour. The lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION: — Coil Model No. 2178. The distributor is integral with the generator. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil stone or with a fine flat jeweler's file.

OILING: — Put 8 or 10 drops of light engine oil in the distributor oiler every month or each 1000 miles. Once each year remove the grease plug in the gear housing and fill the housing with medium heavy cup grease. Place a small bit of medium heavy cup grease on the breaker cam every 1000 miles.

TIMING: — Breaker contacts begin to separate when piston No. 1 reaches top dead center on compression stroke with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1,5,3,6,2,4.

SPARK PLUG GAPS: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER: — Model No. 274. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is clockwise looking at the commutator end. Starter cranks the engine at 175 R. P. M. taking 150 amperes at 6 volts. Lock torque is 10 pound feet at 3.1 volts. Starter running free takes 60 amperes at 6 volts. The tension of each of the starter brushes should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

OILING: — Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

GENERATOR: — Model No. 273. Generator current regulation is by means of the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 12 amperes reached at 1665 R. P. M. of the armature or 18-24 miles per hour, car speed in high gear.

Generator Data.

Amperes	Cold Test (65°)		Amperes	Hot Test (200°)	
	Volts.	R. P. M.		Volts.	R. P. M.
14	6.25	1665	8	6.25	1000
			12	6.25	1665

To adjust the generator output, loosen the commutator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of rotation (counter-clockwise) increases the charging rate while moving it in the opposite direction (clockwise) decreases the charging rate. The field current is 3 amperes at 6 volts. The tension of the generator brushes should be from $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds each.

of the generator every month or each 1000 miles.

RELAY: — No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Shutting off the ignition disconnects the generator and prevents the battery from discharging.

LIGHTING: — Combination Switch Model No. 1258. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

CADILLAC

MODEL V-63 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-LXR-15-2, 6 volt, 130 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2179. Distributor Model No. 5239. Breaker contacts separate .020 inch for new cars; or for a new set of contact arms, and set contact gaps to .015-.018 inch for cars having been driven over 2000 miles on the set of contact arms. They are made of tungsten. If the condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler every two weeks or each 500 miles. The distributor gears and lower bearings are oiled from the timing gear case. Put a small amount of medium heavy grease on the surface of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when piston on compression stroke is $1 \frac{21}{32}$ inches in advance of top center, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1L, 4R, 4L, 2L, 3R, 3L, 2R, 1R.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER-GENERATOR.—Model No. 98. The direction of rotation is counter-clockwise, viewed from the starter commutator end. The starter cranks the engine at 90-100 R.P.M., taking 140-150 amperes. The starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 6 lb. ft. at 3 volts. Running free the starter takes 70 amperes at 6 volts. The tension of the starter brushes should be $2 \frac{1}{4}$ to $2 \frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. The direction of rotation is clockwise, viewed from the generator commutator end.

Amperes	Generator Data.—M.G. 98	R.P.M.
0		420
2		500
15		1000
17-19		1500
13-17		2000

To adjust the charging rate, loosen the generator cover band and the two screws holding the third brush mounting arm. Shift the third brush in the direction of armature rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screws after making the adjustment. The field current is 2.5 amperes at 6 volts. The tension of each of the generator brushes should be $1 \frac{1}{4}$ - $1 \frac{3}{4}$ pounds.

Oiling: — Put 8 or 10 drops of light engine oil in each of the motor-generator oilers every two weeks or each 500 miles. Once each year remove and clear the motor and generator clutches and repack with vaseline.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LIGHTING.—Combination Switch Model No. 1250. Head lamps are 6-8 volt, 21 cp. Side lamps are 6-8 volt, 4 cp. Stop and backing lamps are each 6-8 volt, 21 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator but 10-15 amperes will cause it to continue. A lock-out circuit breaker protects the horn, backing lamp and signal lamp circuits. A current of 25-30 amperes causes it to open the circuit.

Plate No. 965

Model F (1924)
Auto-Lite System

Plate No 966

STAR MODEL F (1924) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type CDN-311, 6 volt, 84 ampere-hours capacity. Starting capacity—96 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model IG-4041. Distributor Model IG-4030-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone. The condenser is now mounted in the distributor housing.

Oiling.—Fill grease cup under the breaker head with soft cup grease and turn down once every two weeks. Put 4 or 5 drops of light engine oil on the wick oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when No. 1 piston is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark plugs: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 to .027 inch.

STARTER:—Model MG-4004. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2300	5.5	100
3 "	1200	5	200
5.9 "	650	4.5	300
8.7 "	150	4	400
18 "	Lock	5	650

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR.—Generator Model GJ. The direction of rotation is counter-clockwise. The third brush system is used for current regulation. Motoring freely, generator takes 4.5 amperes, 6 volts. Field test, 2.2 amperes, 6 volts, each coil separately 8.8 amperes, 6 volts.

Generator Data

Cold Test. (25°C)			Hot Test (75°C)		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type XR-15, 6 volt, 105 ampere-hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model Nos. 288,761C and 395,271. Distributor Model No. 395,209. The breaker contacts separate .013-.015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The surface of the contacts must be parallel. The ignition current is approximately 3 amperes.

Oiling.—Place 4 or 5 drops of light engine oil in the oil cup and apply a small amount of vaseline to the cam with a toothpick once to every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given to every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—Spark plug gaps are .020 to .022 inch.

STARTER.—Frame No. 33A.B. Style 298,808. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter armature revolves at 3700-4100 R.P.M., taking 70 amperes at 5.5 volts. The torque at 1600 R.P.M. is 1.75 pound-feet, the current being 150 amperes at 5.5 volts. The lock torque is 12 pound-feet at 4 volts, the current being 500 amperes. The pressure of the brushes on the commutator is 1 to 1½ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR:—Frame Nos. 35-AT and 36-DT. Generator current regulation is by the third brush system. The maximum charging rate is 10-12 amperes (generator hot), reached at 1250 R.P.M. of the armature or 20-25 miles per hour. The direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	_____	450	0	_____	500
8	_____	675	6	_____	725
15-17	_____	1250	10-12	_____	1250
12	_____	840	9	_____	850
10	_____	2000	7-8	_____	2000

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6.0 to 6.6 volts. Operating as a motor the generator takes 5.0 amperes at 6.0 to 6.3 volts.

Oiling.—Put 5 or 6 drops of light engine oil in the commutator end bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY:—Style No. 301210B. Relay closes at 10 M. P. H. or 500 R. P. M. of armature or at 6.5 volts, and opens when there is a discharge of from 0-3 amperes. The contacts separate .030-.035 inch. The air gap between armature of relay and coil core is .005 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Lighting circuit fuses are 10 ampere. Generator field fuse is 5 ampere.

PIERCE-ARROW

SERIES 33 (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY.—Willard, Type SJR-6. 6 volt, 155 ampere hour. The starting capacity is 165 amperes for 20 minutes. The lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5265. A dual battery ignition system is used. The breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 24-29° Automatic advance starts at 575 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. Contact arm spring tension should be 13-16 ounces.

OILING.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

TIMING.—Breaker contacts begin to separate when the mark "Ignition" on the flywheel is 1¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position. The breaker controlling the right hand coil which fires the spark plugs on the exhaust side of the motor opens 30 to 70 (measured on the flywheel) before the intake breaker.

FIRING ORDER.—The firing order is 1-5-3-6-2-4.

SPARK PLUGS.—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER.—Model No. 252. The starter is connected to the engine through a mechanical gear shift. The two grounded motor brushes serve as a starter switch and are allowed to come in contact with the commutator when the gear shift is operated. This completes the circuit and permits the starter to crank the engine. When the starter button is released, a spring reverses these operations. The starter cranks the engine at 115 R. P. M. taking 180 to 300 amperes. Running free, the current is 50 amperes at 6 volts. Lock torque is 40 lb. ft. the current being 550-600 amperes at 2.75 volts. The brush tension should be 2¼ to 2¾ pounds.

OILING.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR.—Model No. 279. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 22 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
3	600
22	1600

The average output required is 15 amperes. To adjust the charging rate, loosen the generator cover band and the lock nut on the commutator end of the generator. Then shift the third brush mounting plate, by means of the handle attached, in a counter-clockwise direction to increase the charging rate and the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment. The tension of the generator brushes should be 1¾ pounds each.

OILING.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M. P. H., and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and the coil core is .015 -.020 inch, contacts closed.

LIGHTING.—Combination Switch Model No. 1186. Head lamps are each 6-8 volt, 21 cp. Auxiliary head lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome and tonneau lamps are 6-8 volt, 4 cp. All lamps have the single contact base.

FUSES.—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

Series 33 (1924)
Delco System

Plate No. 968.

Plate No. 969

GRAY

MODEL O (1924)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—U. S. L., Type CDX-311-X, 6 volt, 84 ampere hour. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION.—Type SC. Breaker contacts separate .012-.016 inch, fully separated. The are made of tungsten. If the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—See generator oiling.

Timing.—Breaker contacts begin to separate when piston No. 1 is $\frac{7}{32}$ inch before top dead center entering power stroke with the spark control lever and breaker assembly in the fully advanced position.

Resistance of primary coil is 1 ohm. The distance from the distributor arm to carburetor bowl should not be less than $\frac{1}{4}$ of an inch.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .030 inch.

STARTER.—Frame No. 33-AB. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator current of 35-45 amperes, 5.5 volts. Cranking the engine at 100-150 R.P.M., takes end of the motor. Motor running free at 4100-4700 R.P.M. of armature takes a current of 150-200 amperes, 5-5.5 volts. The lock torque is 12 pound-feet, the current being 474 amperes, 4 volts.

Oiling.—Place 4 or 5 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 34-ATL. The direction of rotation is counter-clockwise, looking at commutator end. The generator motoring freely takes 3-4 amperes at 6-6.3 volts. The shunt field current is 2.5-3.2 amperes, 6-6.3 volts. The third brush system is used for current regulation. To increase the generator output, loosen the screws on the rear end of generator bracket, and move the third brush in the direction of armature rotation (counter-clockwise). Move against the direction of rotation or in clockwise direction to decrease the charging rate.

Generator Test Data

Hot Test			Cold Test		
Amperes	R.P.M.	Volts	Amperes	R.P.M.	Volts
0	650	6.5	0	600	6.5
8-11	1500	7.5	12-14	1400-1600	7.5
7-9	2500	7-7.5	9-11	2500	7.0-7.5

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles. The bearing on the drive end of the generator is oiled by the splash from the gears.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7 to 9 miles per hour, or 6-5 volts, and opens at 450-500 R.P.M. of armature, or 5 to 7 miles per hour, or 0-2 amperes discharge. Relay contacts separate .030 inch. The air gap between the relay armature and coil core is .012-.015 inch. The shunt coil resistance is 68 ohms.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. Dash, dome, tail and stop lamps are each 6-8 volt, 2 cp. All lamps have the single contact base.

FUSES.—The generator fuse is 5 amperes. Lighting fuse is 20 amperes.

H. C. S.
SERIES 4, MODEL 6 (1923-24)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5259. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING: — Breaker contacts begin to separate when piston No. 1 is one-half inch past top dead center on compression stroke, with the spark control lever and breaker assembly in the fully retarded position.

SPARK PLUGS.—Diameter, 7/8 inch. Spark gaps are .030 inch.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

STARTER.—Model No. 185. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. The lock torque is 24 lb. ft. at 2.75 volts. Running free the starter draws 50 amperes at 6 volts. The tension of each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR:—Model No. 256. Rotation is counter clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 14 amperes, reached at 1000 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		285
9.5		500
14		1000
12.5		1400
10		2000

Charging rate is varied by adjustment of the third brush setting. To vary the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate must not exceed 17 amperes. The tension of the generator brushes should be from 1 1/4 to 1 3/4 pounds each.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 285-300 R.P.M. of the armature or 7-8 miles per hour, and opens at 250-285 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by bending the long brass stop until the contacts close when the voltmeter indicates 6 3/4-7 1/2 volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating, the current is 10-15 amperes.

MOON

SERIES "A" (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

BATTERY: — Exide, Type 3-XC-31-1. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. 2182. The distributor is mounted on the commutator end of the generator. The breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or an a medium hard oilstone.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of grease on the face of the breaker cam every 1000 miles. Once each year, remove the grease plug on the side of the gear housing and repack compartment with medium heavy cup grease.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is on the top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER: — Model No. 286. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3.1 volts. The pressure of the starter brushes should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

OILING: — Oilless bearing are used. They require no attention.

GENERATOR: — Model No. 287 and 296. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 17 amperes, reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
8	1000
17	1600

To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the plate in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. The plate is held in any desired position by means of friction washers. The pressure of the generator brushes on the commutator should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

OILING: — Put 8 or 10 drops of light engine oil in the bearing oiler on the commutator end of the generator every two weeks or each 500 miles.

RELAY: — Model No. 5754. Relay contacts close at a car speed of 8 M. P. H. when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING: — Switch Model No. 1260 and 1264. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp. A dimmer resistance is used.

CIRCUIT BREAKER: — A vibrating circuit breaker, mounted on the back of the switch, takes the place of fuses. A current of 25-30 amperes will cause the circuit breaker to vibrate. While operating the current is 10-15 amperes.

PEERLESS MODEL 66 (1924) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Exide, Model 3-XXV-19-2, 6 volts, 19 plate, 120 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5250. Breaker contacts separate .015-.0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston entering power stroke is 15 degrees before top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—The spark plug gaps are .020 to .025 inch.

STARTER.—Model No. 248. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter takes 50 amperes at 6 volts. Lock torque is 12 lb. ft. at 2.75 volts. The pressure of the starter brushes on the commutator should be 2¼ to 2¾ pounds.

Oiling.—Put 8 or 10 drops of light engine oil into oiler on commutator end of motor each 500 miles or every two weeks. Saturate the large cotton wick in the oiler on the Bendix drive end of motor each 2000 miles.

GENERATOR.—Model No. 247. Generator current regulation is by the third brush system. The armature is driven at one and one-half times engine speed. Generator charges battery at approximately 8 miles per hour in high gear, or at correspondingly lower speed in low gear. Maximum output is reached at 18 to 25 M.P.H. At higher speed charging rate decreases. Looking at commutator end, the direction of rotation is counter-clockwise.

Generator Test Data

Amperes	R.P.M.
5	800
13-15	1500
15-17 Max.	2000

To adjust the generator output, loosen the commutator cover band and the two screws holding the third brush arm mounting bracket. Then shift the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the two screws after making the adjustment. The pressure of the generator brushes on the commutator should be 1¼ to 1¾ pounds.

Oiling.—Put 8 to 10 drops of light engine oil into generator oilers every two weeks. If car is driven more than 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—There is no relay. The current between the generator and the battery is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Side lamps and dome lamps are 6-8 volts, 4 cp. Tail and dash lamps are 3-4 volts, 2 cp. Signal lamp is 6-8 volts, 21 cp.

FUSES.—A vibrating circuit breaker takes the place of fuses. A current of 25 to 30 amperes will operate vibrator, and will continue to vibrate with a current flow not exceeding 15 amperes. A lockout breaker is located in the dome, stop, and handy lamp circuits and in the horn circuit. A current of 25-30 amperes causes it to open the circuit.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY: — Exide, Type 3-XX-15-1, Willard Type XR-15. 6 volt, 105 ampere hour. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5267. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oil stone.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of hard grease on the fiber bumper of the contact arm every month.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is 15° before top dead center (measured on the flywheel) as indicated by the mark on the flywheel and clutch housing, with the spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are 7/8 inch. Gaps should be .025 inch.

STARTER: — Model No. 282. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free, the starter takes 60 amperes at 6 volts. Lock torque is 11 lb. ft. at 2.8 volts. The pressure of the starter brushes should be 2 1/4-2 3/4 pounds each.

OILING: — Oilless bearings are used. They require no attention.

GENERATOR: — Model No. 284. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes.	R. P. M.
5	700
18	1600

To adjust the generator output, remove the commutator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate, and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction washers. The pressure of the generator brushes on the commutator should be 1 3/4 pounds each.

OILING: — Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY: — Model No. 5754. Relay contacts close at 8 M. P. H. when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The contacts separate .030 inch. The air gap between the relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING: — Switch Model No. 1260. Head lamps are 6-8 volt, 21 cp. S. C. Signal lamp is 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Side, dash and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER: — A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

BAY STATE MODEL 1 AND 2 (1924) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 105 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. The breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated on flywheel by marks "UD," spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, gaps are .027 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Cranking engine, starter takes 125-200 amperes at 5 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4000	36	6
27 "	Lock.	450.500	2.75

The pressure of the starter brushes on the commutator should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Saturate the wick in the oiler at the end of the Bendix gear case with light engine oil once each year. Every six months remove the plug in the reduction gear case and inject medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, remove the cover band and shift the third brush mounting plate by means of an extension handle on the third brush. The plate is held in any position desired by means of friction clamp washers. The maximum charging rate is 16 amperes, reached at 1600 R.P.M.

Generator Test Data

Amperes	R.P.M.
4	800
8	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-10 M.P.H. or at 6.75-7.5 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, and the air gap between the relay armature and coil core is .010-.015 inch, contacts fully closed.

LIGHTING:—Combination Switch Model No. 1246. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 2 cp. D. C. Dimmer, cowl and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current flow of 25-30 amperes, and will continue to function with a current flow of not more than 15 amperes.

DIXIE-FLYER
DYNETO MOTOR AND GENERATOR
EISEMANN MAGNETO

Plate No. 976.

DIXIE FLYER AND NATIONAL FOUR

MODEL H (1923-24) SERIAL NOS. 12000 UP.

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM

EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and magneto breaker assembly in a fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. D69-D284. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

Oiling.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C69-C284. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third- brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 or 32 cp. Dash and tail lamps are in series. They are 3-4 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuses are 10 ampere.

Plate No. 977

CHANDLER

1924

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes, and the lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model FI-635. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contacts affect the ignition, remove and resurface on a medium hard oilstone. If excessively worn, replace the points.

Oiling.—Fill oiler on the side of the distributor housing with light engine oil. Put one drop of light engine oil (less rather than more) on the interrupter lever pivot. Place a bit of hard grease about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. The above lubricating instructions must be followed every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

Timing.—Breaker points just begin to separate when piston No. 1 is on compression stroke, two teeth past top dead center measured on flywheel or two teeth past indicator mark (1:6), spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inches, and the gaps are .020 inch.

STARTER.—Model 935. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine through a Bendix drive. Cranks the engine at 100-150 R.P.M. taking a current of 150 amperes, at 5-5½ volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0	4000	35-40	6
12 lb. ft.	Lock	450	3-4

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 1001. The generator is a 4 inch, 4 pole, 6 volt, shunt wound machine, equipped with ball bearings. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is employed for current regulation. To increase the charging rate turn screw located on the commutator end of the generator. Move the third brush in a counter-clockwise direction to increase the charging rate, and decrease the out-put by moving the third brush in a clockwise direction. The maximum charging rate is 13-14 amperes, at 7.5 volts, reached at 1500-1600 R.P.M. of armature. To make this adjustment, the generator should be at 50°-80° F. at frame, (generator cold) and battery must be fully charged. See that the commutator is not oily or dirty; clean by wiping off with a clean cloth slightly moistened with gasoline. Be sure to wipe dry before operating the generator. The brush tension is 1¾-2¼ pounds.

Hot Test			Generator Test Data			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

8.8	7.0	2400	11.5	7.4	2400	11.5	7.4	2400
6.0	5.6	3200	8.4	6.0	3200	8.4	6.0	3200

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500 R.P.M. of armature or 6-8 M.P.H. or at 6.5-7 volts, and opens at 450 R.P.M. of armature or 5-6 M.P.H. with a current discharge of 0-2 amperes. The contact gap separates .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp. A resistance on the switch is used for dimming. Dash, tail, side and tonneau lamps are each 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 amperes. All other fuses are 20 amperes.

VELIE

MODEL 56 (1924)

WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volts, 80 ampere-hour capacity. The starting capacity is 104 amperes for 20 minutes, and the lighting capacity is 5 amperes for 18 hours. The positive (+) terminal is grounded.

IGNITION.—Distributor Type JA. Coil Type SC. Breaker contacts separate .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. At the same time apply a small amount of vaseline on the interrupter cam.

Breaker.—Breaker contact begins to separate when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .025 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Cranks the engine at 125-145 R.P.M. taking a current of 125-150 amperes at 5.4 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
30-40	5.8	0	3500-6000
525	4	17 lb.-ft.	Lock

Oiling.—Put 5 or 6 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month this care must be given every 1000 miles.

GENERATOR: — Frame No. 36-DT. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the fibre plate in front of generator housing and loosen the brass nut, move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and to decrease the same, move the third brush in the opposite direction (clockwise). The maximum charging rate is 12-14 amperes reached at 1250-1500 R.P.M. of the armature or 20 M.P.H.

Generator Test Data (Hot)

Amperes	R.P.M.
0	500- 550
12-14	1250-1500

Generator motoring freely, takes a current of 5-7 amperes, at 6 volts. The field test draws a current of 2-4 amperes, at 6 volts.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles.

REALY:—Type 301,210B. Relay contacts close at 450 R.P.M. of the generator armature or 7 M.P.H. with a generator voltage of 7-7.5 volts and open at 400 R.P.M. of the armature at 6 M.P.H. with a discharge current of 0-2 amperes. Relay contacts separate .045 inch and the air gap between the relay armature and coil core is .005 inch, contacts closed.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. Dash, side and tail lamps are each 6-8 volt, 2 cp. All lamps are of the single contact type.

FUSES.—All fuses are 10 amperes. Generator field fuse is 5 amperes.

LINCOLN

MODEL 1924

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

LINCOLN
Model 1924
Delco System

Plate No. 979

BATTERY.—Exide, Type 3, LRVX-15-2, 6 volt, 135 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5226. Breaker contacts separate to .020 inch. If burned or pitted, affecting the ignition, resurface on a medium hard oilstone.

Oiling.—Put 3 or 4 drops of oil in the oiler every 250 miles. Also put light cup grease to a level just above the cover plate near the spark advance lever on the forward side of the housing every 5000 miles. A very small amount of grease or vaseline should be applied to the surface of the breaker cam every 2000 miles.

Timing.—The right breaker points should commence to open on the mark "RET" on the clutch-ring. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps are .025-.030 inch.

STARTER-GENERATOR.—Model No. 193. The starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears, meshed by the operator. Two overrunning clutches are provided in connection with the ignition switch. A circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses the operations. The direction of rotation is counter-clockwise, looking at the starter commutator end. The starter running freely, takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3 volts. The pressure of the starter brushes should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush. It begins to supply current at a speed of 7 miles per hour. The maximum charging rate is 16 amperes, reached at 1400 R.P.M. of armature, or 20 miles per hour.

Generator Data.—Motor Generator No. 193

Amperes	R.P.M.
3	600
12	1000
14-16	1400
15	2000

To adjust the charging rate, loosen the commutator cover band and the locknut on the end of the generator. Then turn the adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put a few drops of good oil in front and rear oil cups of the starter-generator bearings every 250 miles.

RELAY.—There is no relay. It is controlled by the ignition switch.

LAMPS.—Head lamps, 6-8 volt, 21 cp. Side, tonneau extension, dash, dome, rear quarter and inspection lamps, each 6-8 volt, 4 cp. Cowl and rear lamps, 3-4 volt, 2 cp. Handy extension lamp, 6-8 volts, 4 cp. Signal lamp, 6-8 volts, 21 cp. All lamps are single contact.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. The vibrating circuit breaker in the lighting circuit begins to operate when the current flow reaches 25-30 amperes. While vibrating the current is not over 15 amperes. The lockout circuit breaker protects the horn and handy lamp circuits. A current of 25-30 amperes causes this device to operate. While operating the current flow is less than 1 ampere.

ROLLIN MODEL G (1924)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION.

BATTERY: — U. S. L. Type 3-CVX-6X, 6 volt, 106 ampere hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 21.2 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 600Y. Distributor Model No. 373-2Y. The breaker points separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with a fine flat jeweler's file. The surface of the points should be kept clean and unpitted.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

TIMING: — Automatic advance is used. A button on the dash connected with the distributor provides a slight retard to prevent the engine laboring on hills. The breaker contacts begin to separate when piston No. 1 on compression stroke is on top dead center (when the flywheel marking is opposite the indicator on the clutch housing) with the spark control button in the fully advanced position i. e. pushed all the way in.

FIRING ORDER: — The firing order is 1-3-4-2.

SPARK PLUGS: — The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .020-.025 inch.

STARTER: — Model No. DE-607. The starter is a six pole, two brush machine using a special type of field winding. The field coil for all six poles is so wound that each pole is surrounded by a U shaped section of the coil. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	6000	6.0	60.
3 "	1500	5.5	200.
18 "	Lock.	3.5	650.

OILING: — The starter bearing are fitted with oilless bronze bushings. They require no attention.

GENERATOR: — Model No. CE-614. Generator current regulation is by the third brush system. The generator is equipped with two shunt fields, each being wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected to the same brushes as the light shunt field. The direction of rotation is counter-clockwise looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.

Amperes.	Volts.	R. P. M.
0	6.5	475
8	7.0	650
13-15	7.4	1000
8.5	7.0	3600

To adjust the generator output, loosen the hexagon head screw on the generator end plate between the generator and the cylinder block, and move the screw downward to increase the charging rate and upward to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative. The generator should never be run in this condition; two brushes must be raised, any two will serve. If the car is to be run without a battery, the generator must be short-circuited by connecting a wire between the generator terminal and the frame or ground.

OILING: — Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY: — The relay is mounted on the back of the combination switch. The contacts close when the voltage of the generator reaches 7 to 7.5 volts and open with a discharge current of 0 to 2 amperes.

LIGHTING: — Connecticut Switch Model No. 187-1-Y. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

FUSES: — The main lighting fuse on the back of the switch is 15 ampere. Closed cars have a fuse mounted on a block under the front seat frame at the side of the body above the battery.

Connecticut Ignition.

Plate No. 980.

PACKARD

MODELS 226-233 SIX (1924) AND 136-133 EIGHT (1923-24)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

BATTERY: — Prest-O-Lite, (Six) Type 613-SHC. 6 volt, 112.5 ampere-hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. (Eight) Type 617-SHC. 6 volt, 160 ampere hour. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION: — Delco Coil Model No. 2175 (Six and Eight). Delco Distributor model No. 5249 (Six) and 5260 (Eight). Breaker contacts separate .020-.025 inch on the Six and .015-.020 inch on the Eight. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring should be 16-20 ounces. The distributor is of the combined manual and automatic advance type. Manual advance is 40°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M.

Oiling: — Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease, the size of a match head, on the face of the breaker cam. Wipe out the distributor head and polish the rotor track with a bit of grease, removing all excess with a clean cloth.

Timing: — Breaker contacts begin to separate when Piston No. 1 on compression stroke reaches a position 2 inches before top dead center (measured on the flywheel) when the flywheel marking 'Upper D. C. Cylinder 1 & 6' is two inches before the dead center mark on the housing on the six cylinder car, and 1 3/8 inches before top dead center (measured on the flywheel) when the flywheel marking Upper D. C. cylinder 1 & 8 is 1 3/8 inches before the dead center mark on the housing on the eight cylinder car. The spark control lever and breaker assembly should be in fully advanced position.

Firing Order: — The firing order is (Six) 1-5-3-6-2-4 and (Eight) 1-3-2-5-8-6-7-4

Spark Plugs: — Spark plug diameters are 7/8 inch. Gaps are 1/32 inch. Fuelizer spark plug gap is 1/8 inch. A cutout switch connected to the throttle lever short circuits the fuelizer spark plug on the Eight at high speeds. This device is not used on the Six

STARTER: — Model DE-524 (Six & Eight) and DG-646 (Eight). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is a six pole, two brush motor having but a single field coil. The field coil is so constructed that it winds around each pole in turn, each pole being surrounded by a 'U' shaped section of the coil.

Starter Data Model DE-524.

Torque	R. P. M.	Volts	Amperes
0 lb. ft.	6000	6.0	60
3. "	1500	5.5	200
18. "	Lock.	3.5	650

Model DG-646.

Torque	R. P. M.	Volts	Amperes
0 lb. ft.	6000	6.0	50
10.5 "	500	4.5	350
25.0 "	Lock.	3.5	620

Oiling: — Put 4 or 5 drops of light machine oil in the oilhole on the commutator end plate every month or each 1000 miles. The drive end of the motor is fitted with oilless bronze bushings which require no attention.

PACKARD

MODELS 226-233 SIX (1924) AND 136-143 EIGHT (1923-24)
OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION.

Continued from Page 981

GENERATOR: — Model CE-523. Generator current regulation is by the third brush system. The generator is equipped with two shunt fields, each wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected across the same brushes as the light shunt field. The direction of rotation is counter-clockwise, looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.

Amperes.	Volts.	R. P. M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	3500

To adjust the generator out put loosen the screw in the center of the knurled nut on the generator end plate. Turn the nut to the left to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this position. Two brushes must be raised any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is probably shorted. The drive end bearing for the Model CG generator is in the engine. Before this machine can be run on the test bench a special bearing must be bolted on. This is Part No. 22196 and can be secured from the Owen-Dyneto Corporation.

Oiling: — The drive end of the generator is oiled by splash from the gear case. Put 4 or 5 drops of light machine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY: — The relay is mounted on top of the generator. Relay contacts close at 385-400 R. P. M. of the generator when the voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes.

LIGHTING: — Delco Combination Switch Model 1229 (Six) Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volts, 6 cp. Dome lamp is 6-8 volt, 8 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Delco Combination Switch Model 1251 (Eight) Head lamps are 6-8 volt, 32 cp. Auxiliary head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. (In head lamp bulbs). Dome lamp is 6-8 volt, 6 cp. Dash, tail and tonneau lamps are each 6-8 volt, 2 cp. All lamps have single contact base.

CIRCUIT BREAKER: — A vibrating circuit breaker mounted in the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

STERLING-KNIGHT.
Model B-6 (1924).
Westinghouse System.

Plate No. 983.

STERLING-KNIGHT MODEL B-6 (1924) SERIAL NOS. 101 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION.

BATTERY: — Exide, Type 6-XC-11-1, 12 volt, 75 ampere hour. The starting capacity is 81.5 amperes for 20 minutes. The lighting capacity is 5 amperes for 13.4 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 395113. Distributor Model JN. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on medium hard oilstone.

OILING: — Put 4 or 5 drops of light engine oil in the oilcup at the bottom of the distributor housing every week or each 250 miles.

TIMING: — Breaker contacts begin separate when piston entering power stroke is on top dead center on compression stroke with the spark control lever and breaker assembly in the fully retarded position. At this point the dead center mark on the flywheel will be opposite the indicator mark on the flywheel housing.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — The spark plug diameters are $\frac{7}{8}$ inch. Gaps should be .022 to .025 inch.

STARTER: — Frame No. 755 The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. On test, the starter should never be run free with more than six volts.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	3500-5500	5.5	35-55
3.5	2200	10.5	195
20.0	Lock.	5.5	575

The pressure of each of the starter brushes on the commutator should be $2\frac{1}{2}$ to 3 pounds.

OILING: — Fill the oiler on either end of the starter with light engine oil every 500 miles or each two weeks.

GENERATOR: — Frame 57-GT. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, loosen the screw on the generator end plate that holds the third brush arm and shift the third brush. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 11 amperes reached at 1100 R. P. M. of the generator armature.

Generator Data.

Hot Test			Cold Test		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0	13	500	0	13	475
6	15	800	6	15	650
			9-11	15	750-1100
			6	15	2000

The shunt field draws 3.5 amperes at 12 volts. The pressure of the brushes on the commutator should be 1 to $1\frac{1}{2}$ pounds each.

OILING: — Fill the oiler on either end of the generator with light engine oil every week or each 250 miles.

RELAY: — The relay contacts close at 475 R. P. M. of the generator armature or when the voltage of the generator reaches 13 volts, and open with a discharge current of 0 to 3 amperes. Relay contacts separate .035 to .045 inch. The air gap between the relay armature and coil core is .015 inch, contacts closed.

LIGHTING: — Delco Combination Switch, Model 1256. Head lamps and stop lamp are each 12 volt, 21 cp. S. C. Dimmer lamps are 12 volt, 4 cp. S. C. Dome lamp is 12 volt, 6 cp. S. C. Dash and tail lamps are each 12 volt, 2 cp. S. C.

FUSES: — Generator field fuse is 5 ampere. A vibrating circuit breaker mounted on the back of the switch protects the horn and lighting circuits.

STANLEY STEAMER.
Model 750 (1924)

Plate N . 984.

STANLEY STEAMER

MODEL 750 (1924)

BLJUR GENERATING AND LIGHTING SYSTEM.

BATTERY: — Westinghouse, Type 6-C-13. 6 volt, 105 ampere-hour. The lighting capacity is 5 amperes for 21 hours. The negative (-) terminal is grounded.

GENERATOR: — Model L-220, M-1802. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current control. The maximum charging rate is 10-14 amperes, reached at 1200 R. P. M. of the generator armature.

Generator Data.

Hot Test (200°F)			Cold Test (70°F)		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	7.5	500	0	7.5	400
6	8.1	725	6	8.1	625
10	8.3	1000	10	8.3	900
12	8.5	1200	12	8.5	1100
7	7.9	3300	7	7.9	3200

To adjust the generator output, remove the commutator cover band and loosen the third brush bracket slot screw. Then shift the bracket in a clockwise direction to increase the charging rate and in opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Motoring freely, the generator revolves at 380 R. P. M. taking 5-6 amperes at 6.1 volts. The shunt field draws 5 amperes at 6.1 volts. The pressure of each of the generator brushes on the commutator should be 20 ounces.

RELAY: — Model 27. Relay contacts close when the voltage of the generator reaches 6.75 volts and open with a discharge current of 2 to 3.2 amperes. The contacts separate .020 inch. The air gap between the relay armature and the coil core should be .015 inch.

LIGHTING: — Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash tail, side and dome lamps are each 6-8 volt, 4 cp.

Plate No. 985

REO

MODEL T-6 SERIES C (1924) NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH-EAST IGNITION

BATTERY:—Willard, Type SJR-4. 6 volt. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 10481. Distributor Model T Type 10695. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Never use emery cloth.

Oiling.—The distributor cap and rotor arm should be kept clean and dry. They ordinarily need no lubrication, because the carbon contacts are self-lubricating. Make sure that the carbon brush is free in its socket, also that the flat spring carrying the center contact is bent up sufficiently to make good contact with the distributor cap.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark "Spark" on flywheel is even with the top edge of right hand engine support, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER:—Model R. Type 3581-A. Starter is connected to the engine through a ratchet and chain on a universal shaft. If the starter mechanism ever fails to engage or takes hold with a thump or pound when the starter button is depressed, it is an indication that there is not enough tension on the friction cable. On the other hand if the pawl is not brought entirely out of engagement when the starter button is released, there is too much friction on the friction cable. To adjust the tension slack off or draw up the nut which holds the end of the rod. The starter cranks the engine at 100 R.P.M. with a current of 95-110 amperes. Lock torque is 50 lb. ft., with a current of 470 amperes.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. The reduction gear case is filled with No. 4 Keystone grease and requires very infrequent renewal.

GENERATOR:—Model MAT Type 3929-L-6. (With Ignition) The direction of rotation is counter-clockwise, looking at driving end. The third brush system is used for current regulation. To adjust the charging rate, loosen lock screws on the commutator end housing. Turning the adjusting screw in the clockwise direction increases the charging rate, and turning to the counter-clockwise direction decreases the charging rate. Be sure to tighten the lock screw in order that the adjustment of generator output is locked in position desired. The maximum charging rate is 18-19 amperes reached at 1350-1500 R. P. M. of the generator armature.

Generator Test Data

Amperes (Cold)	Volts	R.P.M.	Amperes (Hot)
17.....	6.5.....	1250.....	15.6
18.....	7.0.....	1320.....	16.3
19.....	7.5.....	1440.....	17.0
20.....	8.0.....	1600.....	17.6
21.....	8.5.....		18.2

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler and oiler under distributor head every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. The gear case is packed with No. 4 Keystone grease and should be refilled each year.

RELAY:—Type 11,690-A. The relay closes at 525 R. P. M. of the armature or 10-12 M.P.H. at 6.5-7.5 volts, and opens at 425-500 R.P.M. of armature or 8-10 M.P.H., with a current discharge of 0-2 amperes. The contact gap is .025-.040 inch, contacts fully separated. The air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dash, dimmer and tail lights are each 6-8 volts, 2 cp. Trouble light is 6-8 volts, 2 cp. All the above lights are of the single contact type.

FUSES.—Generator fuse is 6 amperes, and the lighting fuses are 5 amperes each.

DURANT MODEL A-22 (1923-24). AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM. AUTO-LITE IGNITION.

BATTERY:— U. S. L. Type 3-HVX-5X, 6 volt 92 ampere hour. Starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.2 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model No. IG-4013. Distributor Model No. IG-4018-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil-stone.

OILING:— Put 4 or 5 drops of light engine oil in the distributor wick oiler every two weeks or each 250 miles.

TIMING:— Breaker contacts begin to separate when piston No. 1 on compression stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:— The firing order is 1-2-4-3.

SPARK PLUGS:— Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .027 inch.

STARTER:— Model MF-1096. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R. P. M. taking 115 amperes at 5 volts.

Starter Data.			
Torque	R. P. M.	Volts.	Amperes
2 lb. ft.	1265	5	175.
5 "	735	5	305
8 "	315	5	425
10 "	Lock.	4	500

The pressure of the starter brushes on the commutator should be from $1\frac{3}{4}$ to $2\frac{1}{2}$ pounds each.

OILING:— Self-oiling graphite bronze bearings are used. They require no attention.

GENERATOR:— Model GH-1036. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise) and in the opposite direction to decrease the charging rate. The maximum charging rate of 16 amperes is reached at 2400 R. P. M. of the generator armature or 31.5 M. P. H., car speed in high gear.

Cold Test (77°F.)			Hot Test (230°F.)		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0	6.6	650	0	6.9	760
4	7.2	880	4	7.3	1050
10	7.8	1320	10	7.6	1600
16	8.3	2400	13.9	7.9	2560
12.	8.0	3820	12.	7.8	3650

The pressure of the main brushes on the commutator should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each. The third brush pressure should also be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds.

OILING:— Put 4 or 5 drops of light engine oil in the oil cup on the commutator end of the generator every two weeks or each 500 miles. The drive end of the generator is oiled by the splash from the gears.

RELAY:— Model CB-1072. The relay closes at 675 R. P. M. of the generator when the voltage reaches 7 to 7.5 volts and opens with a discharge current of 0 to 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:— Nagel Combination Switch. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are 6-8 volt, 2 cp. D. C. and S. C. Side lamps (used on 1924 cars only) are 6-8 volt, 2 cp. S. C.

FUSES:— Lighting circuit fuse is 20 ampere. No generator fuse is used.

Model 4-A (1923-1924)
American Bosch System

Plate No. 987.

PREMIER

MODEL 4-A (TAXICAB) (1923-24) SERIAL NOS. T-0001 UP.
AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM.
AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 611-KPC. 6 volt, 137.5 ampere hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 27.5 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model No. TM-4130 (1923) and T-4224 (1924). Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

OILING:—Fill the oiler on the side of the distributor housing with light engine oil once each month or each 1000 miles. Put one drop of oil on the interrupter lever pivot pin and place a small bit of grease on the fiber bumper of the interrupter lever at the same time.

TIMING:—The breaker contacts begin to separate when the piston entering power stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1-3-4-2.

SPARK PLUGS:—The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .028 inch.

STARTER:—Model No. 917 The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
Free	4000	6	50 to 60
1.2 lb. ft.	1900	5.5	100
3.7	1000	5.0	200
6.5	550	4.5	300
10.0	200	4.0	400
12.5	Lock.	3.5	490

The pressure of each of the starter brushes on the commutator should be 2 pounds.

OILING:—The starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model No. 1229. The direction of rotation is counter-clockwise, the commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes reached at 1200 to 1300 R. P. M. of the generator armature.

Generator Data.

Cold Test.			Hot Test,		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	6.5	550	0	6.5	650
8	7.5	780	8	7.5	850
16-18	8.0	1300	12-13	8.0	1400
8-10	7.8	3000	7-9	7.5	3000

To adjust the charging rate shift the third brush. Shifting the brush in the direction of generator rotation (counter-clockwise) increases the output and in the opposite direction, decreases the charging rate. Motoring freely the generator takes 6 amperes at 6 volts. The shunt field current is 6.5 amperes at 6 volts. The pressure of the main brushes on the commutator should be 1.5 pounds. The third brush pressure should be 1.25 pounds.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Bosch, Model No. 21560. The relay contacts close when the voltage of the generator reaches 6.5 to 7.5 volts and open with a discharge current of 1 to 3 amperes. Relay contacts separate .015 inch. The air gap between the relay armature and the coil core is .010 inch.

LIGHTING:—Clum Combination Switch Model No. 10361, Head lamps are 6 volt, 21 cp. S. C. Stop lamp is 6 volt, 15 cp. S. C. Side and dome lamps are 6 volt, 4 cp. S. C. and D. C. Sign lamp is 6 volt, 18 cp. D. C. Meter lamp is 6 volt, 2 cp. D. C. Vacant lamp is 6 volt, 4 cp. Dash and tail lamps are each 6 volt, 2 cp. S. C.

FUSES:—Generator field fuse is 7.5 amperes capacity.

FLINT.
Model 6-40
Auto-Lite System

Plate No. 988

FLINT

MODEL 6-40 (1924)

AUTO-LITE, GENERATING, STARTING AND LIGHTING SYSTEM.

AUTO-LITE IGNITION.

BATTERY: — U. S. L. 3-HVX-5X, 6 volt, 92 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model 1G-4047. Distributor Model 1G-4003-A. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil stone.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is on top dead center, with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are $\frac{7}{8}$ inch, SAE standard. Gaps are .022 to .025 inch.

STARTER: — Model MG-4004. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 160 R. P. M. taking 145 amperes at 5.3 volts.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
1 lb. ft.	2300	5.5	100
3 lb. ft.	1200	5.0	200
5.9 lb. ft.	650	4.5	300
8.7 lb. ft.	150	4.0	400
18 lb. ft.	Lock	5.0	650

The starter brush tension should be $2\frac{1}{4}$ to 3 pounds each.

OILING: — The commutator end of the starter is fitted with an oilless bearing. Put 4 or 5 drops of light engine oil in the oiler at the drive end of the starter every two weeks or each 500 miles.

GENERATOR: — Model GJ-4014. The direction of rotation is counter-clockwise, looking at the commutator end of the generator. Current regulation is by the third brush system. To adjust the charging rate turn the third brush shifting screw located on the generator end plate. Turning the screw to the right increases the charging rate, and to the left decreases the charging rate. The maximum charging rate of 16 amperes is reached at 1700 R. P. M. of the armature or 25 M. P. H. car speed in high gear.

Generator Data

Cold Test. (25°C)			Hot Test (75°C)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

The generator running freely as a motor at 300-400 R. P. M. takes 3.24-4.0 amperes at 6.35 volts. Shunt field current is 1.9-2.2 amperes at 6.2 volts. A single coil will draw 7.6 to 8.8 amperes at 6.2 volts. The brush tension should be $1\frac{1}{2}$ -2 pounds each.

OILING: — The front bearing is oiled by the splash from the chain case. Put 4 or 5 drops of light engine oil in the oiler on the rear end of the generator every two weeks or each 500 miles.

RELAY: — Auto-Lite. Model CB-4009. Relay closes at 600 R. P. M. of the armature at 8.9 M. P. H. with a generator voltage of 7-9 volts, and opens at 400 R. P. M. or 6 M. P. H. with a discharge current of $\frac{1}{2}$ to $2\frac{1}{2}$ amperes. Relay contacts separate .025-.035 inch and the air gap between relay armature and coil core is .015-.030 inch, contacts closed.

LIGHTING: — Clum Combination Switch. Head and stop lamps are 6-8 volt, 21 cp. Dash, tail and side lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

FUSES: — No generator field fuse is used. Lighting fuse is 20 amperes.

OILING: — Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY: — De Jon Model RA-4001. Relay contacts close at 425 R. P. M. of the generator armature when the voltage of the generator reaches 7-8 volts, and open at 375 R. P. M. of the armature or 0-2 amperes discharge. Relay contacts separate .025-.035 inch. The air gap between the relay armature and coil core is .015 inch, contacts closed.

LIGHTING: — Connecticut Toggle Switch. Head and Stop lamps are 6-8 volt, 21 cp. Dash, tail and side lamps are each 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

FUSES: — Generator field fuse is 5 amperes. Lighting fuse is 20 ampere.

LOCOMOBILE

SERIES 48. (1923-24-25) SERIAL NOS. 18101 UP.
WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY:—(Cars 18101 to 18999) Westinghouse. 12 volt, 85 ampere hour. (Cars 19000 Up) Prest-O-Lite, Type 12-11 S.H.C. 12 volt, 92.5 ampere hour at the five ampere rate. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2135. Distributor Model No. 5258. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Manual advance is 24-29°. Automatic advance starts at 600 R.P.M. and reaches a maximum of 15-18° at 2000 R.P.M. The tension of the contact arm spring should be 16-20 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in each of the oilers on the side of the distributor housing every 1000 miles. Remove the plug and fill gear compartment with very light gear grease to the level of the lower side of the horizontal shaft each six months. Put a small bit of vaseline on the breaker cam and wipe out the distributor head with a small bit of vaseline, removing all excess, every 1000 miles.

Timing:—Breaker contacts in the ignition circuit firing the plugs over the intake valves (rear distributor) begin to separate when the piston reaches a position 1/16 inch past top dead center entering power stroke with the spark control lever and breaker assembly in the fully retarded position. This position is approximately 1 1/2 inches past top dead center measured on the flywheel. Breaker contacts firing plugs over the exhaust valves open approximately 3-7° earlier than this.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .027 inch.

STARTER:—Frame No. 779. Starter is connected to the engine through a magnetically operated pinion shift. The direction of rotation is counter-clockwise looking at the commutator end. Pinion should be pulled into mesh in 10% of one revolution with a current of 125 amperes and must not be held in by a current of 65 amperes.

Starter Data.

Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	Free.	5.5	65
3.5 "	2400	10.5	210
28.5 "	Lock.	6.0	750

The starter brush pressure should be 2.5 to 3 pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the oilers every 500 miles.

GENERATOR:—Frame No. 787-R. The direction of rotation is clockwise looking at the commutator end. Generator regulation is by an automatic voltage regulator. To increase generator output increase regulator voltage by turning the regulator adjusting screw in a clockwise direction. The maximum generator output is 10 amperes reached at 1250 R.P.M. of the generator armature.

Generator Data.

Amperes.	Volts.	R.P.M.	Field Amperes
0	13	450	1.8
4	13	500	1.6
10	13	800	1.4
10	13	1250	1.35

Motoring freely the generator draws 5 amperes at 12 volts. The field draws 1.5 amperes at 12 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY-REGULATOR:—Relay contacts close at 450 R.P.M. of the generator when the voltage reaches 12.4 volts and open with a discharge current of 0 to 3 amperes. Set regulator contacts at 1250 R.P.M. of the generator with an output of 10 amperes at 13 volts. Relay air gap is .055-.060 inch. Regulator air gap is .055 inch. Center gap is .015 inch.

LIGHTING:—Bryant Electric Co. four button Gang switch. Head and stop lamps are 12-16 Volt, 21 cp. S.C. Dash, dome, tonneau, side and tail lamps are each 12-16 volt, 2 cp. S.C. With dimmer resistance, head lamps are 2 cp.

FUSES:—Ignition fuse is 20 amperes. All other fuses are 10 ampere.

CHEVROLET

SUPERIOR MODEL (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Exide, Type 3-XC-13-1, Willard, Type XW-13, 6 volt, 90 ampere-hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plug gaps are .025 inch.

STARTER.—Model No. 711-BX The direction of rotation looking at the commutator end is counter-clockwise. Starter is connected to motor by a Bendix drive. Cranks th at 160 R.P.M. taking 140 amperes. Starter brush tension should be 20-24 ounces each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
10 "	Lock	3.5	425

Starter uses four brushes instead of two as shown. The brush opposite the grounded brush is also grounded. The brush opposite the ungrounded brush is connected to it.

Oiling.—Put 4 or 5 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model No. 950-B. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for voltage regulation. The maximum charging rate is 18 amperes reached at 1800 R.P.M. of the generator armature. Brush tension is 14-18 ounces each. Shunt field current is 5 amperes at 6 volts.

Generator Test Data					
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	640			
7	7.73	880	12-15	8-8.5	1750
15-17	8.3-8.8	1750			
8.5-15.5		2500			

To adjust the generator charging rate, loosen the generator cover band and the screw on the generator end plate. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Tail and coil lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 4 cp.

FUSES.—One fuse is used; 20 amperes.

DUESENBERG

STRAIGHT EIGHT MODEL A (1925) SERIAL NOS. 1050 UP. DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

DUESENBERG
Straight Eight (1925)
Delco Generating, Starting, and Lighting System
Delco Ignition
Plate No. 992

BATTERY.—Willard, Type SR-5, 6 volts, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2135. Distributor Model 15735. The contacts separate .015-.020 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 30°. Automatic advance begins at 750 R.P.M. and reaches a maximum of 25° at 2400 R.P.M. The contact arm spring tension should be 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack distributor housing with medium soft cup grease up to advance ring and yoke once each season. A very small amount of soft grease or vaseline should be applied to breaker cam every 2000 miles. Apply a very small amount of vaseline to rotor track occasionally during the first 2000 miles until rotor track becomes glazed, then no further attention will be necessary.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke, is 1/2 inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded. Timing can also be made by locating marks 1:4 on the flywheel through inspection plate on top of flywheel housing. Be sure that piston No. 1 is on compression stroke, contacts begins to separate one-half inch past top dead center measured on flywheel.

Firing Order.—The firing order is 1, 5, 3, 7, 4, 8, 2, 6.

Spark Plugs.—The spark plug diameters are 18 millimeters, gaps are 1/32 inch.

STARTER.—Model No. 200. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to engine through a Bendix drive. Motor running free takes 50 amperes at 6 volts. Lock torque is 24 pound-feet at 2.75 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each of the starter brushes.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once each year saturate the wick in the oiler on the end of the Bendix gear case with light engine oil.

GENERATOR.—Model No. 242. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 16-18 amperes, reached at 1600 R.P.M. of the armature. To adjust the charging rate, remove the cover band over the commutator and loosen the lock-nut on the end of the generator. Then shift the third brush mounting plate in a clockwise direction (direction of rotation) to increase the charging rate and in the opposite (counter-clockwise) direction to decrease the charging rate.

Generator Test Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
3 (Min.)	600		4 (Min.)	600	
12	1000		13.5	1000	
15-17 (Max.)	1600		16-19 (Max.)	1600	
12	2400		13	2400	

The brush tension of each of the generator brushes should be 1 1/4-1 3/4 lbs.

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contacts close at 7 miles per hour or at 7 to 7 1/2 volts and open at 3-4 M.P.H., with a discharge current of 0-3 amperes. Relay contacts separate .025 to .035 inch. The air gap between the relay armature and coil core is .025 to .035 inch, contacts closed.

LIGHTING.—Combination Switch No. 1226 is used. Head and spot lamps are 6-8 volts, 21 cp. Dimmer lamp is 6-8 volts, 4 cp. Tail lamp is 6-8 volts, 2 cp. Dash lamp is 6-8 volts, 2 cp.

CIRCUIT BREAKER.—A circuit breaker is used in place of fuses. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to function until the current flow does not exceed 15 amperes. The lock-out circuit breaker opens the circuit when the current flow reaches 25-35 amperes. While operating the current is less than one ampere.

ROLLIN MODEL G (1925)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION.

ROLLIN.
Model G (1925)
Owen-Dyneto Generating, Starting and Lighting System.
Connecticut Ignition.

Plate No. 993

BATTERY: — U. S. L. Type 3-CVX-6X, 6 volt, 106 ampere hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 21.2 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 600Y. Distributor Model No. 373-2Y. The breaker points separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with a fine flat jeweler's file. The surface of the points should be kept clean and unpitted.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

TIMING: — Automatic advance is used. A button on the dash connected with the distributor provides a slight retard to prevent the engine laboring on hills. The breaker contacts begin to separate when piston No. 1 on compression stroke is on top dead center (when the flywheel marking is opposite the indicator on the clutch housing) with the spark control button in the fully advanced position i. e. pushed all the way in.

FIRING ORDER: — The firing order is 1-3-4-2.

SPARK PLUGS: — The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .020-.025 inch.

STARTER: — Model No. DE-607. The starter is a six pole, two brush machine using a special type of field winding. The field coil for all six poles is so wound that each pole is surrounded by a U shaped section of the coil. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	6000	6.0	60.
3 "	1500	5.5	200.
18 "	Lock.	3.5	650.

OILING: — The starter bearing are fitted with oilless bronze bushings. They require no attention.

GENERATOR: — Model No. CE-614. Generator current regulation is by the third brush system. The generator is equipped with two shunt fields, each being wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected to the same brushes as the light shunt field. The direction of rotation is counter-clockwise looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.

Amperes.	Volts.	R. P. M.
0	6.5	475
8	7.0	650
13-15	7.4	1000
8.5	7.0	3600

To adjust the generator output, loosen the hexagon head screw on the generator end plate between the generator and the cylinder block, and move the screw downward to increase the charging rate and upward to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative. The generator should never be run in this condition; two brushes must be raised, any two will serve. If the car is to be run without a battery, the generator must be short-circuited by connecting a wire between the generator terminal and the frame or ground.

OILING: — Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY: — The relay is mounted on the back of the combination switch. The contacts close when the voltage of the generator reaches 7 to 7.5 volts and open with a discharge current of 0 to 2 amperes.

LIGHTING: — Connecticut Switch Model No. 187-1-Y. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

FUSES: — The main lighting fuse on the back of the switch is 15 ampere. Closed cars have a fuse mounted on a block under the front seat frame at the side of the body above the battery.

Remy Ignition

Plate No. 994

STUTZ

MODELS 693, 694 AND 695 (1925) REMY GENERATING, STARTING, AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—Willard, Type XR-17, 6 volt, 130 ampere hour. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-P. Distributor Model No. 626-H. Breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and resurface with a fine jeweller's file or on a medium hard oilstone. It is not necessary to grind the contact points if they are badly pitted or burned. Just brighten up the surface of the point and remove the raised portion of the opposite point.

Oiling:—Fill oil cup under distributor head with light engine oil every two weeks. Apply a small amount of vaseline to the breaker cam every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 is at top head center on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order:—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs:—The spark plug diameters are 7/8 inch, and the gaps are .022 inch.

STARTER:—Model No. 720-J. The starter is connected to the engine by an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. No. 1 S.A.E. flange mounting is used.

Starter Test Data

Torque	Amperes	Volts	R.P.M.
0 (Running Free)	65	5.0	6000 (Approx.)
15 ft.-lbs.	570	3.15	0 (Lock)

The brush tension is 20-28 ounces.

Oiling:—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR:—Model 917-R. The direction of rotation is counter-clockwise, looking at commutator end. The generator is base mounted, and is driven by a coupling at 1 1/2 times engine speed. The third brush system is used for current regulation with automatic thermostatic control. The charging rate is adjusted by loosening the screw on the end plate which holds the third brush and shift the same in the direction of rotation (clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (counter-clockwise). The maximum charging rate is 18 amperes, reached at 1900 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test		R.P.M.	Cold Test		
	Volts	R.P.M.	Amperes	Volts	R.P.M.	
9-12 (Max.)	8.0-8.5	1800-2000	0	6.75	675	(Relay cut-in.)
			7	7.0-7.3	850	
			18-20 (Max.)	8.4	1900	
			10-17	2500		

The brush tension is 22-28 ounces. The shunt field draws 5 amperes at 6 volts.
Oiling:—Fill oil cups at each end of generator with light engine oil once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Relay closes at 675 R.P.M. of armature, or 10 M.P.H. at 6.9 volts; and opens with a current discharge of 0-3 amperes. The contact gap is .014 inch, contacts fully separated. The air gap between relay armature and coil core is .020 inch, contacts fully closed.

LIGHTING:—Head lights are each 6-8 volts, 21 cp. Signal light is 6-8 volts, 15 cp. Side, tail, and instrument lights are each 6-8 volts, 2 cp. All of the above lights are of the single contact type. The instrument lights are grounded to the oil gauge.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted on the back of the combination switch takes the place of fuses.

PIERCE-ARROW

SERIES 33 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY.—Willard, Type SJR-6. 6 volt, 155 ampere hour. The starting capacity is 165 amperes for 20 minutes. The lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5265. A dual battery ignition system is used. The breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 24-29° Automatic advance starts at 575 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. Contact arm spring tension should be 13-16 ounces.

OILING:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

TIMING:—Breaker contacts begin to separate when the mark "Ignition" on the flywheel is 1¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position. The breaker controlling the right hand coil which fires the spark plugs on the exhaust side of the motor opens 30° to 70° (measured on the flywheel) before the intake breaker.

FIRING ORDER:—The firing order is 1-5-3-6-2-4.

SPARK PLUGS:—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER:—Model No. 252. The starter is connected to the engine through a mechanical gear shift. The two grounded motor brushes serve as a starter switch and are allowed to come in contact with the commutator when the gear shift is operated. This completes the circuit and permits the starter to crank the engine. When the starter button is released, a spring reverses these operations. The starter cranks the engine at 115 R. P. M. taking 180 to 300 amperes. Running free, the current is 50 amperes at 6 volts. Lock torque is 40 lb. ft. the current being 550-600 amperes at 2.75 volts. The brush tension should be 2¼ to 2¾ pounds.

OILING:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR:—Model No. 279. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 22 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
3	600
22	1600

The average output required is 15 amperes. To adjust the charging rate, loosen the generator cover band and the lock nut on the commutator end of the generator. Then shift the third brush mounting plate, by means of the handle attached, in a counter-clockwise direction to increase the charging rate and the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment. The tension of the generator brushes should be 1¾ pounds each.

OILING:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M. P. H., and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and the coil core is .015 - .020 inch, contacts closed.

LIGHTING:—Combination Switch Model No. 1186. Head lamps are each 6-8 volt, 21 cp. Auxiliary head lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome and tonneau lamps are 6-8 volt, 4 cp. All lamps have the single contact base.

FUSES:—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

PIERCE-ARROW
Series 33 (1925)
Delco System

Plate No. 995

PIERCE-ARROW **SERIES 80 (1925)** **DELCO GENERATING, STARTING, AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY.—Willard, Type SJR-4. 6 volt, 120 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor and Generator Model No. 300. The breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 40°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. The tension of the contact arm spring is 16-20 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

Timing:—Breaker contacts begin to separate when the mark "Ignition" on the flywheel is 2¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER:—Model No. 297. The starter is connected to the engine through a mechanical gear shift. The starter cranks the engine at 130 R.P.M. taking 150 to 300 amperes. Running free, current is 60 amperes at 6 volts. Lock torque is 19.5 lb. ft. with a motor terminal voltage of 3.5 volts. Brush spring tension should be 2¼-2¾ pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR.—Model No. 300. The direction of generator rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes reached at 1500 R.P.M. of the generator armature or 20-25 M.P.H.

Generator Data.

Amperes	R.P.M.
4	800
17	2000

The average output required is 15 amperes. To adjust the the charging rate, loosen the generator cover band and shift the third brush mounting plate, by means of the handle attached in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Generator brush spring tension should be 1¾ pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M.P.H. and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the realy armature and the coil core is .015-.020 inch, contacts closed.

LIGHTING:—Combination Switch Model No. 1271. Head lamps are 6-8 volts, 21 cp. Auxiliary lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome and tonneau lamps are 6-8 volt, 4 cp. All lamps have the single contact base.

FUSES:—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

PACKARD

MODELS 326-333 SIX AND 336-343 EIGHT (1925)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

BATTERY: — Prest-O-Lite, (Six) Type 613-SHC. 6 volt, 112.5 ampere-hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. (Eight) Type 617-SHC. 6 volt, 160 ampere hour. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION: — Delco Coil Model No. 2175 (Six and Eight). Delco Distributor model No. 5249 (Six) and 5260 (Eight). Breaker contacts separate .020-.025 inch on the Six and .015-.020 inch on the Eight. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring should be 16-20 ounces. The distributor is of the combined manual and automatic advance type. Manual advance is 40°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M.

Oiling: — Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease, the size of a match head, on the face of the breaker cam. Wipe out the distributor head and polish the rotor track with a bit of grease, removing all excess with a clean cloth.

Timing: — Breaker contacts begin to separate when Piston No. 1 on compression stroke reaches a position 2 inches before top dead center (measured on the flywheel) when the flywheel marking "Upper D. C. Cylinder 1 & 6" is two inches before the dead center mark on the housing on the six cylinder car, and 1 5/8 inches before top dead center (measured on the flywheel) when the flywheel marking Upper D. C. cylinder 1 & 8 is 1 5/8 inches before the dead center mark on the housing on the eight cylinder car. The spark control lever and breaker assembly should be in fully advanced position.

Firing Order: — The firing order is (Six) 1-5-3-6-2-4 and (Eight) 1-3-2-5-8-6-7-4

Spark Plugs: — Spark plug diameters are 7/8 inch. Gaps are 1/32 inch. Fuelizer spark plug gap is 1/8 inch. A cutout switch connected to the throttle lever short circuits the fuelizer spark plug on the Eight at high speeds. This device is not used on the Six

STARTER: — Model DE-524 (Six & Eight) and DG-646 (Eight). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is a six pole, two brush motor having but a single field coil. The field coil is so constructed that it winds around each pole in turn, each pole being surrounded by a "U" shaped section of the coil.

Starter Data

Model DE-524.

Torque	R. P. M.	Volts	Amperes
0 lb. ft.	6000	6.0	60
3. "	1500	5.5	200
18. "	Lock.	3.5	650

Model DG-646.

Torque	R. P. M.	Volts	Amperes
0 lb. ft.	6000	6.0	50
10.5 "	500	4.5	350
25.0 "	Lock.	3.5	620

Oiling: — Put 4 or 5 drops of light machine oil in the oilhole on the commutator end plate every month or each 1000 miles. The drive end of the motor is fitted with oilless bronze bushings which require no attention.

Continued on Page 998

PACKARD MODELS 326-333 SIX AND 336-343 EIGHT (1925) OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION.

Continued from Page 997

GENERATOR: — Model CE-523. Generator current regulation is by the third brush System. The generator is equipped with two shunt fields, each wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected across the same brushes as the light shunt field. The direction of rotation is counter-clockwise, looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.

Amperes.	Volts.	R. P. M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	3500

To adjust the generator out put loosen the screw in the center of the knurled nut on the generator end plate. Turn the nut to the left to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this position. Two brushes must be raised any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is probably shorted. The drive end bearing for the Model CG generator is in the engine. Before this machine can be run on the test bench a special bearing must be bolted on. This is Part No. 22196 and can be secured from the Owen-Dyneto Corporation.

Oiling: — The drive end of the generator is oiled by splash from the gear case. Put 4 or 5 drops of light machine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY: — The relay is mounted on top of the generator. Relay contacts close at 385-400 R. P. M. of the generator when the voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes.

LIGHTING: — Delco Combination Switch Model 1229 (Six) Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volts, 6 cp. Dome lamp is 6-8 volt, 8 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Delco Combination Switch Model 1251 (Eight) Head lamps are 6-8 volt, 32 cp. Auxiliary head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. (In head lamp bulbs). Dome lamp is 6-8 volt, 6 cp. Dash, tail and tonneau lamps are each 6-8 volt, 2 cp. All lamps have single contact base.

CIRCUIT BREAKER: — A vibrating circuit breaker mounted in the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

FORD
Model T (1925)
Ford-Liberty System

Plate No. 999

FORD

MODEL T (1925)

LIBERTY GENERATING, STARTING AND LIGHTING SYSTEM

FORD IGNITION

BATTERY.—Ford, Exide, U. S. L., or Prest-O-Lite, 6 volt, 80 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magneto delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Oiling.—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of 1/4 kerosene and 3/4 light engine oil should be used.

Timing.—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 160 amperes at 5 volts.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Oiling.—Starter requires no oiling.

GENERATOR.—Type F.A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 2 cp.

LINCOLN

MODEL 1925

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3, LRVX-15-2, 6 volt, 135 ampere-hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2159. Distributor Model No. 5226. Breaker contacts separate to .020 inch. If burned or pitted, affecting the ignition, resurface in a medium hard oilstone.

Oiling.—Put 3 or 4 drops of oil in the oiler every 250 miles. Also put light cup grease to a level just above the cover plate near the spark advance lever on the forward side of the housing every 5000 miles. A very small amount of grease or vaseline should be applied to the surface of the breaker cam every 2000 miles.

Timing.—The right breaker points should commence to open on the mark "RET" on the clutch-ring. Spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1R, 4L, 2R, 3L, 4R, 1L, 3R, 2L.

Spark Plug Gaps.—Spark plug gaps are .025-.030 inch.

STARTER-GENERATOR.—Model No. 193. The starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears, meshed by the operator. Two overrunning clutches are provided in connection with the ignition switch. A circuit is closed, allowing current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses the operations. The direction of rotation is counter-clockwise, looking at the starter commutator end. The starter running freely, takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3 volts. The pressure of the starter brushes should be 2 1/4-2 3/4 pounds each.

GENERATOR.—Generator current regulation is by the third brush. It begins to supply current at a speed of 7 miles per hour. The maximum charging rate is 16 amperes, reached at 1400 R.P.M. of armature, or 20 miles per hour.

Generator Data.—Motor Generator No. 193

Amperes	R.P.M.
3	600
12	1000
14-16	1400
15	2000

To adjust the charging rate, loosen the commutator cover band and the locknut on the end of the generator. Then turn the adjusting screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put a few drops of good oil in front and rear oil cups of the starter-generator bearings every 250 miles.

RELAY.—There is no relay. It is controlled by the ignition switch.

LAMPS.—Head lamps, 6-8 volt, 21 cp. Side, tonneau extension, dash, dome, rear quarter and inspection lamps, each 6-8 volt, 4 cp. Cowl and rear lamps, 3-4 volt, 2 cp. Handy extension lamp, 6-8 volts, 4 cp. Signal lamp, 6-8 volts, 21 cp. All lamps are single contact.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. The vibrating circuit breaker in the lighting circuit begins to operate when the current flow reaches 25-30 amperes. While vibrating the current is not over 15 amperes. The lockout circuit breaker protects the horn and handy lamp circuits. A current of 25-30 amperes causes this device to operate. While operating the current flow is less than 1 ampere.

Plate No. 1001

BREWSTER

MODEL 02 (1924-25)

U. S. L. GENERATING, STARTING AND LIGHTING SYSTEM

BERLING IGNITION

BATTERY:—Exide. Type 6-XX-13-1. 12 volt, 90 ampere hour. The starting capacity is 185 amperes for 20 minutes. The negative (—) terminal is grounded.

IGNITION:—Model ZR-4. Breaker contacts separate .016-.020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING:—Put 10 drops of light engine oil in each of the magneto oil cups every month. Put a small amount of vaseline on the cam and on the rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING:—Breaker contacts begin to separate when piston entering power stroke is 5 millimeters before top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS:—Spark plugs are $\frac{7}{8}$ inch in diameter. Gaps should be .020 inch.

STARTER-GENERATOR.—Model E-207. Armature is fastened to the engine crankshaft, taking the place of the flywheel. When operating as a starter, the unit cranks the engine at 175 R.P.M., taking 185 amperes.

GENERATOR.—Generator current regulation is by third brush and compensating field. Maximum current output is 12 amperes at 500 R.P.M. of the armature or 18 miles per hour. Pressure of brushes on the commutator is $1\frac{3}{4}$ pounds.

OILING.—Starter-generator requires no oiling.

RELAY.—Relay closes at 11 miles per hour or 350 R.P.M. of the armature, and opens at 9 miles per hour or 250 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 36 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES:—Lighting fuses are 20 ampere. Large fuse in relay box is 30 ampere. Small field fuse is 6 ampere capacity.

Plate No. 1002

WILLYS-KNIGHT

MODEL 64-67 (1925)

**AUTO LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION**

BATTERY.—U. S. L., Type 3HVX-8X, 6 volt. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 4035. Distributor Model IG-4036B. Breaker contacts separate .018 inch contacts fully separated. If condition affects ignition, remove and re-surface on a hard oilstone.

Oil.—Put 4 or 5 drops of light engine oil into timer distributor each week. If the car is driven over 250 miles in a week, this care must be given every 250 miles.

Timing.—Breaker contacts just open when flywheel is 12° late on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plugs, diameter $\frac{7}{8}$ inch. Gap, .025 inch.

STARTER:—Model MH-4002. Direction of rotation looking at commutator end is counter-clockwise. The starter is connected to engine by a Bendix drive. Motor running free at 4000 R.P.M., takes 40-60 amperes, at 6 volts, cranking engine at 100 to 200 R.P.M., takes 250-300 amperes at 5 volts. Lock torque is 17.5 pound feet, current being 600 amperes at 3.4 volts.

Oiling.—Pour 7 or 8 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR:-Model GJ-4010A. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is used for voltage regulation. Move third brush in counter-clockwise direction to increase the output, and to decrease, in the opposite direction. The maximum charging rate is 12-13 amperes (generator hot) reached at 1700 R.P.M. of the generator armature or approximately 20-25 M. P. H.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.8	500	0	6.8	600
4	7.	580	4	7.3	740
8	7.6	650	8	7.8	950
12	8.	950	11	8.	1200
16.5	8.4	1700	12.7	8.2	1700
15	8.3	2400	11.6	8.1	2400
12.6	8.2	3200			

Motoring freely the generator takes 4.5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling—Pour 7 or 8 drops of light engine oil into generator oiler once a week. If car is driven more than 250 miles in a week, this care must be given each 250 miles.

RELAY.—Relay closes at 7.9 M.P.H., 500-550 R.P.M., 7-8 volts, and opens at 5-7 M.P.H. 450-500 R.P.M., 1-2 ampere discharge. Contacts separate .025-.035 inch; and air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING.—Clum Combination Ignition and Lighting Switch is used. Head lamps are 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps are 3-4 volts, 2 cp., S.C.

FUSES.—Fuses are 20 amperes.

Plate No. 1003

OVERLAND

MODEL 91 (1925)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type 3CVL-5XB, 6 volt. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4035. Distributor Model IG-4036A. Breaker contacts separate .018 inch, contacts fully separated. If condition of contact points affects ignition, remove and resurface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into the distributor oiler each week. If the car is driven over 250 miles in a week, this must be done each 250 miles.

Timing.—Breaker contacts just open when top dead center mark on flywheel is $2\frac{1}{2}$ inches before reaching dead top center indicator, on compression stroke, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters are $\frac{1}{2}$ inch. Gaps are .025 inch.

STARTER.—Model MG-1001. The direction of rotation looking at commutator end is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. Running free at 4000 R.P.M., it requires 40-60 amperes at 6 volts. Cranks engine at 125 R.P.M., taking 150 amperes at 5 volts. Lock torque is 16 pound feet taking 600-650 amperes at 3-4 volts.

Oiling.—Put 7 or 8 drops of light engine oil into oil filler hole of the starting motor every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR.—Model GP-4003A. The direction of rotation of the armature looking at commutator end, is counter-clockwise. The third brush system is employed for current regulation. Move third brush in counter-clockwise direction to increase the output and in the opposite direction to decrease the output. The maximum charging rate is 10-11 amperes (generator hot) reached at 1500 R.P.M. of the generator armature or approximately 20-25 miles per hour.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	7.0	375	0	6.5	475
4	7.2	500	4	6.8	640
8	7.4	650	7	7.4	800
12	7.8	875	10	7.6	1200
15	7.9	1225	10.6	7.8	1540
16	8.0	1600	8.2	7.8	2400
13	7.8	2400			

Motoring freely generator draws 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling.—Put 8 or 10 drops of light engine oil into the generator oilers each week. If the car is driven more than 250 miles in a week, this oiling must be done each 250 miles.

RELAY.—Model CB-1078. Relay closes at 325-375 R.P.M. or 7-9 M.P.H. at 7-8 volts and opens at 275-325 R.P.M. of armature, or 5-7 M.P.H., 1-2 ampere discharge. Contact gaps separate .025 to .035. Core gap is .010-.015 inch, contacts closed.

LIGHTING.—Briggs and Stratton Combination Ignition and Lighting Switch is used.

LAMPS.—Head lamps, 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps, each 3-4 volts, 2 cp., S.C.

FUSES.—One 20 ampere fuse is used.

DIXIE-FLYER
DYNETO MOTOR AND GENERATOR
EISEMANN MAGNETO

Plate No. 1004

DIXIE FLYER AND NATIONAL FOUR MODEL H (1925)

DYNETO GENERATING, STARTING AND LIGHTING SYSTEM

EISEMANN MAGNETO IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 80 ampere-hour. The two-wire system is used.

IGNITION.—Breaker contacts separate .015 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or well worn No. 00 sandpaper.

Oiling.—Put 3 or 4 drops of light engine oil in each of the magneto oilers every month. Put a very small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and magneto breaker assembly in a fully retarded position.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. D69-D284. Starter is connected to the engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Amperes	Volts
0.0 lb. ft.	5600	25	6.4
2.5 lb. ft.	1400	150	5.8
5.0 lb. ft.	850	250	5.3
10.0 lb. ft.	250	420	4.6
14.0 lb. ft.	Lock	530	4.0

Oiling.—Put several drops of light engine oil in starter oilers every month.

GENERATOR.—Model No. C69-C284. Generator current regulation is by the third brush system. Maximum current output of 14 amperes is reached at 16-18 miles per hour or 1500 R.P.M. of armature.

Generator Data

Amperes	M.P.H.	Volts
0	7-9	6.4
5	9-10	6.6
10	12-14	6.8
12-14	16-18	7.8
8	40-45	6.7

Charging rate may be varied by adjusting the third- brush setting. Shunt field current is 3.5 amperes at 6.5 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 450-500 R.P.M. of armature, and opens at 6-8 miles per hour or 400-450 R.P.M. of armature. Relay contacts separate 3/32 inch. Air gap between relay armature and coil core is 1/8 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 or 32 cp. Dash and tail lamps are in series. They are 3-4 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting fuses are 10 ampere.

REO
Model T-6 (1925)
North-East Generating, Starting and Lighting System
North-East Ignition

Plate No. 1005

REO **MODEL T-6 SERIES C (1925)** **NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM** **NORTH-EAST IGNITION**

BATTERY:—Willard, Type SJR-4. 6 volt. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 10481. Distributor Model T Type 10695. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Never use emery cloth.

Oiling.—The distributor cap and rotor arm should be kept clean and dry. They ordinarily need no lubrication, because the carbon contacts are self-lubricating. Make sure that the carbon brush is free in its socket, also that the flat spring carrying the center contact is bent up sufficiently to make good contact with the distributor cap.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark "Spark" on flywheel is even with the top edge of right hand engine support, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER:—Model R, Type 3581-A. Starter is connected to the engine through a ratchet and chain on a universal shaft. If the starter mechanism ever fails to engage or takes hold with a thump or pound when the starter button is depressed, it is an indication that there is not enough tension on the friction cable. On the other hand if the pawl is not brought entirely out of engagement when the starter button is released, there is too much friction on the friction cable. To adjust the tension slack off or draw up on the nut which holds the end of the rod. The starter cranks the engine at 100 R.P.M. with a current of 95-110 amperes. Lock torque is 50 lb. ft., with a current of 470 amperes.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. The reduction gear case is filled with No. 4 Keystone grease and requires very infrequent renewal.

GENERATOR:—Model MAT, Type 6089-L-6. (With Ignition). The direction of rotation is counter-clockwise, looking at driving end. The third brush system is used for current regulation. To adjust the charging rate, loosen lock screws on the commutator end housing. Turning the adjusting screw in the clockwise direction increases the charging rate, and turning to the counter-clockwise direction decreases the charging rate. Be sure to tighten the lock screw in order that the adjustment of generator output is locked in position desired. The maximum charging rate is 18-19 amperes reached at 1350-1500 R. P. M. of the generator armature.

Generator Test Data			
Amperes (Cold)	Volts	R.P.M.	Amperes (Hot)
17	6.5	1250	15.6
18	7.0	1320	16.3
19	7.5	1440	17.0
20	8.0	1600	17.6
21	8.5		18.2

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler and oiler under distributor head every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. The gear case is packed with No. 4 Keystone grease and should be refilled each year.

RELAY:—Type 11,690-A. The relay closes at 525 R. P. M. of the armature or 10-12 M.P.H. at 6.5-7.5 volts, and opens at 425-500 R.P.M. of armature or 8-10 M.P.H., with a current discharge of 0-2 amperes. The contact gap is .025-.040 inch, contacts fully separated. The air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dash, dimmer and tail lights are each 6-8 volts, 2 cp. Trouble light is 6-8 volts, 2 cp. All the above lights are of the single contact type.

FUSES.—Generator fuse is 6 amperes, and the lighting fuses are 5 amperes each.

PREMIER
Model 4-B (1925)
American Bosch System.

Plate No. 1006

PREMIER

MODEL 4-B (1925) SERIAL NOS. T-2001 UP.
AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM.
AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 611-KPC. 6 volt, 137.5 ampere hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 27.5 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-4234. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file.

OILING:—Fill the oiler on the side of the distributor housing with light engine oil once each month or each 1000 miles. Put one drop of oil on the interrupter lever pivot pin and place a small bit of grease on the fiber bumper of the interrupter lever at the same time.

TIMING:—The breaker contacts begin to separate when the piston entering power stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1-3-4-2.

SPARK PLUGS:—The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .028 inch.

STARTER:—Model No. 1213. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
Free	4000	6	50 to 60
1.2 lb. ft.	1900	5.5	100
3.7	1000	5.0	200
6.5	550	4.5	300
10.0	200	4.0	400
12.5	Lock.	3.5	490

The pressure of each of the starter brushes on the commutator should be 2 pounds.

OILING:—The starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model No. 1229. The direction of rotation is counter-clockwise, the commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes reached at 1200 to 1300 R. P. M. of the generator armature.

Generator Data.

Cold Test.			Hot Test.		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	6.5	550	0	6.5	650
8	7.5	780	8	7.5	850
16-18	8.0	1300	12-13	8.0	1400
8-10	7.8	3000	7-9	7.5	3000

To adjust the charging rate shift the third brush. Shifting the brush in the direction of generator rotation (counter-clockwise) increases the output and in the opposite direction, decreases the charging rate. Motoring freely the generator takes 6 amperes at 6 volts. The shunt field current is 6.5 amperes at 6 volts. The pressure of the main brushes on the commutator should be 1.5 pounds. The third brush pressure should be 1.25 pounds.

OILING:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Bosch, Model No. 21560. The relay contacts close when the voltage of the generator reaches 6.5 to 7.5 volts and open with a discharge current of 1 to 3 amperes. Relay contacts separate .015 inch. The air gap between the relay armature and the coil core is .010 inch.

LIGHTING:—Clim Combination Switch Model No. 10361, Head lamps are 6 volt, 21 and 10 cp. (Double filament). Stop lamp is 6 volt, 21 cp. S. C. Side lamps and dome lamp are 6 volt, 4 cp. S. C. and D. C. Sign lamp is 6 volt, 18 cp. S. C. Meter lamp is 6 volt, 2 cp. D. C. Vacant lamp is 6 volt, 4 cp. Dash and tail lamps are each 6 volt, 2 cp. S. C.

FUSES:—Generator field fuse is 7.5 amperes capacity.

CLIMBER

MODELS T AND K (1925)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

Plate No. 1007

BATTERY.—Battery is 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Type CC. Breaker contacts separate .006 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Remove the distributor cap and put 4 or 5 drops of light engine oil in the exposed oil hole every two weeks. Put a small amount of vaseline on the cam, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS.—Diameter $\frac{7}{8}$ inch. Spark plugs are .030 inch.

STARTER.—Frame No. 100. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 130 R.P.M., taking 250-300 amperes.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4100-7000	35-45	5.5
1.75 lb. ft.	1600	145	5.5
12 lb. ft.	Lock	475	4.0

Pressure of brushes on the commutator is $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR.—Frame No. 765. Generator current regulation is by third brush system. Maximum current output is 15-17 amperes at 900-1400 R.P.M. of the armature or 20-25 miles per hour.

Amperes	Generator Data	R.P.M.
0		375
8		550
15-17		900-1400
7-11		2500
11-13	Hot Test	1200

Field winding takes 3.25 to 3.75 amperes at 6 to 6.3 volts. Running freely as a motor, generator takes 6 amperes at 6 to 6.3 volts. Charging rate is varied by adjustment of the third brush setting.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 375-425 R.P.M. of the armature or 8-10 miles per hour and opens at 350-375 R.P.M. of the armature or 6-8 miles per hour. Adjust relay spring tension so that contacts open with a discharge current of 0-3 amperes from the battery. Adjust armature stop (which determines the air gap between the relay armature and coil core) so that the contacts close when the voltage of the generator reaches 6.2 to 6.5 volts. Contacts separate .030 to .035 inch. Air gap between relay armature and coil core is .005 inch, contacts closed. Resistance of the shunt winding is 68 ohms. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 20 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 4 cp. Tail lamp has single contact base. All others have double contact base.

Plate No. 1008

REVERE

1925

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM BOSCH IGNITION

BATTERY.—Willard, Type SJR-6, 6 volt, 120 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .014 to .016 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 2 or 3 drops of light engine oil in each of the magneto oilers every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUG GAPS.—Spark plug gaps are .025 inch.

STARTER.—Frame 776. Starter is connected to the engine through a Bendix drive. Lock torque is 31 pound-feet, current being 750 amperes at 4 volts. The magnetic switch is connected to the relay-regulator in such a manner that it cannot operate after the relay has closed.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Frame 781, Type S-293,478 or N-301,687. Generator voltage regulation is by vibrating regulator. Maximum generator output is 20 amperes at 6.5 volts, reached at 1200 R.P.M. of the armature or 20 miles per hour. Charging rate reduces to 4 amperes as battery becomes fully charged. Shunt field current is 1.4 to 1.6 amperes at 6 volts. Operating freely as a motor, generator takes 5 amperes at 6 volts.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY-REGULATOR.—Relay closes at 550-600 R.P.M. of the armature or 8-10 miles per hour, and opens at 500-550 R.P.M. of the armature or 6-8 miles per hour. To adjust the relay, regulate the spring tension until the contacts open with a discharge current of 1 to 3 amperes. Then disconnect the battery and vary the air gap between relay armature (moving member) and coil core by bending the lower prong, until relay contacts just close when a voltmeter connected from the "A" generator terminal to ground indicates 6.5 to 7 volts. This air gap between the relay armature and coil core is .055 to .060 inch. To adjust the regulator, disconnect the wire from the terminal "B" and connect a voltmeter between this post and ground. Operate the engine at a speed corresponding to 20 miles per hour, or drive the generator at 1200 R.P.M., and adjust the spring tension on the regulator armature by turning the thumb screw until the voltmeter indicates 8.75 volts. Clean relay and regulator contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 17 cp. Dimmer lamps are 6-8 volt, 5 cp. Side lamps are 6-8 volt, 5 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volt, 4 cp.

FUSES.—Fuses are 15 ampere.

STERLING-KNIGHT.
Model B-6 (1925)
Westinghouse System.
Plate No. 1009

STERLING-KNIGHT

MODEL B-6 (1925) SERIAL NOS. 531 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION.

BATTERY: — Exide, Type 6-XC-11-1, 12 volt, 75 ampere hour. The starting capacity is 81.5 amperes for 20 minutes. The lighting capacity is 5 amperes for 13.4 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 395113. Distributor Model JN. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on medium hard oilstone.

OILING: — Put 4 or 5 drops of light engine oil in the oilcup at the bottom of the distributor housing every week or each 250 miles.

TIMING: — Breaker contacts begin separate when piston entering power stroke is on top dead center on compression stroke with the spark control lever and breaker assembly in the fully retarded position. At this point the dead center mark on the flywheel will be opposite the indicator mark on the flywheel housing.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — The spark plug diameters are $\frac{7}{8}$ inch. Gaps should be .022 to .025 inch.

STARTER: — Frame No. 755 The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. On test, the starter should never be run free with more than six volts.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	3500-5500	5.5	35-55
3.5	2200	10.5	195
20.0	Lock.	5.5	575

The pressure of each of the starter brushes on the commutator should be $2\frac{1}{2}$ to 3 pounds.

OILING: — Fill the oiler on either end of the starter with light engine oil every 500 miles or each two weeks.

GENERATOR: — Frame 57-GT. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, loosen the screw on the generator end plate that holds the third brush arm and shift the third brush. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 11 amperes reached at 1100 R. P. M. of the generator armature.

Generator Data.

Hot Test			Cold Test		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0	13	500	0	13	475
6	15	800	6	15	650
			9-11	15	750-1100
			6	15	2000

The shunt field draws 3.5 amperes at 12 volts. The pressure of the brushes on the commutator should be 1 to $1\frac{1}{2}$ pounds each.

OILING: — Fill the oiler on either end of the generator with light engine oil every week or each 250 miles.

RELAY: — The relay contacts close at 475 R. P. M. of the generator armature or when the voltage of the generator reaches 13 volts, and open with a discharge current of 0 to 3 amperes. Relay contacts separate .035 to .045 inch. The air gap between the relay armature and coil core is .015 inch, contacts closed.

LIGHTING: — Delco Combination Switch, Model 1256. Head lamps and stop lamp are each 12 volt, 21 cp. S. C. Dimmer lamps are 12 volt, 4 cp. S. C. Dash lamp is 12 volt, 4 cp. S. C. Dash and tail lamps are each 12 volt, 2 cp. S. C.

FUSES: — Generator field fuse is 5 ampere. A vibrating circuit breaker mounted on the back of the switch protects the horn and lighting circuits.

STERLING KNIGHT

MODEL B-6 (1925)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM

DEJON IGNITION

BATTERY:—Exide, Type 6-XC-11-1. 12 volt, 75 ampere hour. The starting capacity is 81.5 amperes for 20 minutes. The lighting capacity is 5 amperes for 13.4 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model CA-4006. Distributor Model IA-4006. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The coil draws 4.75-5 amperes at 12 volts which reduces to 2-2.1 amperes as the ballast resistance becomes hot.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks; or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the surface of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. At this point the dead center mark on the flywheel will be opposite the indicator mark on the flywheel housing.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .022-.025 inch.

STARTER:—Model SB-4004. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter should never be run free with more than 6 volts.

Starter Data.

Torque.	R.P.M.	Volts.	Amperes
0 lb. ft.		5	40
1 lb. ft.	3400	11	100
3.6 lb. ft.	2250	10	200
6.6 lb. ft.	1700	9	300
10.2 lb. ft.	1250	8	400
29 lb. ft.	Lock	4	880

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter oilers every month; or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model DC-4002. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, insert a screwdriver in the slotted head of the third brush shifting shaft located in the generator end plate above the bearing retainer. Turn the shaft in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate.

Generator Data

Cold Test		Hot Test.	
Amperes.	R.P.M.	Amperes.	R.P.M.
0	500	0	600
4	600	5	800
8	800	8	1000
11	1000	9	1200
12	1200	11	1600
14	1600	9	2000
12	2000	8	2400
11	2400	7	2800
10	2800		

The shunt field current is 1.6 to 1.8 amperes at 12 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month; or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model RA-4002. Relay is mounted on top of the generator. Relay contacts close at 500 to 575 R.P.M. of the generator armature with a voltage of 13.5 to 14.5 volts and open with a discharge current of 1/2 to 2 amperes. Charging current is approximately 1 ampere at closing of contacts. Contacts separate .025 to .035 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING:—Head and stop lamps are 12 volt, 21 cp. S. C. Dimmer lamps and dome lamp are 12 volt, 4 cp. S. C. Dash and tail lamps are each 12 volt, 2 cp. S. C.

FUSES:—Generator field fuse is 5 ampere. It is located in the plug on the generator end plate.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY:—Willard, Type SJR-3. 6 volt, 100 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Type S. C. Coil Model No. 288,761. Distributor Model No. 366,180. Breaker contacts separate .008 to .012 inch. They are made of tungsten. When the pitting of the contacts affects the ignition, remove and resurface with a medium oil-stone. The bumper of the contact spring is $\frac{1}{8}$ inch off center from the line through the center of the shaft and terminal screw, this offset being opposite to the direction of rotation of the cam. The above adjustment is made by bending the solid arm at the terminal block. A pull of 20 to 25 ounces, applied to the movable contacts, is required to separate the contacts .020 inch. This spring pressure is adjusted by bending the solid arm at the point of contact with the contact spring. Resistance of the primary winding and ballast of the ignition coil is 1 ohm. Resistance of the secondary winding is 3700-4700 ohms.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the side of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is 20° after top dead center, spark control lever and breaker assembly in the fully retarded position. Advance, 30° before top dead center.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .025 inch.

STARTER:—Frame No. 100. Style No. 355,721-A. The rotation of starter armature, looking at commutator end, is counter-clockwise. Starter is connected to engine through a Bendix drive. Starter cranks engine at 115 R.P.M., developing a torque of 2.2 lb. ft.

Starter Test Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4100-4700	5.5	35-45
12 lb. ft.	0	4.0	475

Brush tension should be $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds.

Oiling.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.
GENERATOR:—Frame No. 35-AT. Style No. 395,241-C. The direction of rotation looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system. Maximum current output is 17 amperes, reached at 1500 R.P.M. of armature. Brush tension at $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds per brush.

Generator Test Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	500			
8	8.0	750	10	8.0	1200
15-16	8.0	1600			

To increase the charging rate, shift the third brush in the direction of armature rotation and to decrease charging rate shift the brush in the opposite direction.

Oiling.—Put 5 or 6 drops of light engine oil in the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Westinghouse, Model 301,210-B. Relay is mounted on generator frame. Relay closes at 500 R.P.M. of the armature or at 0 to 2 amperes. Relay contacts separate .030 inch to .035 inch. Adjust air gap between relay armature and coil core to .005 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Generator fuse is 5 ampere. Lighting circuit fuses are 20 ampere.

CHANDLER
1925

American Bosch Generating, Starting and Lighting System
American Bosch Ignition

Plate No. 1012

CHANDLER

1925

AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes, and the lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model FI-635. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contacts affect the ignition, remove and resurface on a medium hard oilstone. If excessively worn, replace the points.

Oiling.—Fill oiler on the side of the distributor housing with light engine oil. Put one drop of light engine oil (less rather than more) on the interrupter lever pivot. Place a bit of hard grease about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. The above lubricating instructions must be followed every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

Timing.—Breaker points just begin to separate when piston No. 1 is on compression stroke, one-half tooth past top dead center, measured on the flywheel, with the spark control lever in the fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inches, and the gaps are .020 inch.
STARTER.—Model 935. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to the engine through a Bendix drive. Cranks the engine at 100-150 R.P.M. taking a current of 150 amperes, at 5-5½ volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0.....	4000.....	35-40.....	6.....
12 lb. ft.....	Lock.....	450.....	3-4.....

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 1059. The generator is a 4 inch, 4 pole, 6 volt, shunt wound machine, equipped with ball bearings. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is employed for current regulation. To increase the charging rate turn screw located on the commutator end of the generator. Move the third brush in a counter-clockwise direction to increase the charging rate, and decrease the out-put by moving the third brush in a clockwise direction. The maximum charging rate is 13-14 amperes, at 7.5 volts, reached at 1500-1600 R.P.M. of armature. To make this adjustment, the generator should be at 50°-80° F. at frame, (generator cold) and battery must be fully charged. See that the commutator is not oily or dirty; clean by wiping off with a clean cloth slightly moistened with gasoline. Be sure to wipe dry before operating the generator. The brush tension is 1¼-2¼ pounds.

6.0.....	5.6.....	3200.....	8.4.....	6.0.....	3200.....	8.4.....	6.0.....	3200.....

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500 R.P.M. of armature or 6-8 M.P.H. or at 6.5-7 volts, and opens at 450 R.P.M. of armature or 5-6 M.P.H. with a current discharge of 0-2 amperes. The contact gap separates .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp. A resistance on the switch is used for dimming. Dash, tail, side and tonneau lamps are each 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 amperes. All other fuses are 20 amperes.

CLEVELAND
Model 43 (1925)
American Bosch System.
Plate No. 1013

CLEVELAND

MODEL 43 (1925) SERIAL NOS. 60000 UP.

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM

AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHN, 6 volt, 80 ampere-hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-6230. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Distributor oiling is from the chassis lubricating system.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 943. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks engine at 110 R.P.M. taking 150 amperes at 6 volts.

Starter Data.

Torque	R.P.M.	Volts	Amperes.
0 lb. ft.	4000	6	45-50
2 "	1500	"	130
6 "	600	"	280
10 "	250	"	410
12 "	125	"	465
15 "	Lock	6	540

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 1052. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Shift the third brush by means of the adjusting screw on the outside of the generator. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13 to 14 amperes reached at 1500-1600 R. P. M. of the generator armature or 21.8 M.P.H.

Generator Data.

Cold Test (20°C)			Hot Test (85°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.	520	0	6.	520
7	7.0	800	4	6.6	800
13.6	7.7	1600	9.8	7.3	1600
11.6	7.4	2400	8.8	7.0	2400
8.3	6.0	3200	6.0	5.6	3200

Motoring freely at 500 R.P.M. the generator draws 4 amperes at 6 volts. The shunt field current is 2-3 amperes at 6 volts. Brush pressure should be $1\frac{3}{4}$ to $2\frac{1}{4}$ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks this oiling should be done every 500 miles.

RELAY:—Relay is mounted on top of the generator. Relay contacts close at 800 R.P.M. or 11 M.P.H. when the generator voltage reaches 6.5 to 7.5 volts and open at 500 R.P.M. or 7 M.P.H. with a discharge current of 0 to 2 amperes. Charging current at closing of contacts is approximately 0 to 2 amperes. Contacts separate .012 to .014 inch. Air gap between relay armature and coil core is .018 inch.

LIGHTING:—Clum Switch Model 20. Head lamps are 6-8 volts, 21 cp. Dash, tail, tonneau, dome and side lamps are 6-8 volt, 3 cp. With dimming resistance, head lamps are approximately 3 cp.

FUSES:—Generator field fuse is 5 ampere. Lighting fuse is 20 ampere.

DODGE

1925

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM DODGE-NORTH-EAST IGNITION

BATTERY.—Willard, Type SJR-26, also Exide, 12 volt, 51.4 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Type 10,205. Distributor Model O, Type 10,004. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Force grease into distributor by means of a grease nipple, using a pressure feed grease gun once every month or 2000 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER-GENERATOR.—Model GA, Type 3804-A. The direction of rotation is counter-clockwise, looking at the commutator end. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as permit 1/2 inch up-and-down play midway between the sprockets.

Starter Data.

Torque	R.P.M.	Amperes
6 lb. ft.....	460.....	49
10 lb. ft.....	350.....	78
13 lb. ft.....	295.....	95
16 lb. ft.....	233.....	116
35 lb. ft.....	Lock.....	225

GENERATOR.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0.....	1000		0.0.....	900	
5.0.....	1200		5.5.....	1100	
7.0.....	1200		8.0.....	1200	
8.0.....	1800		9.0.....	1800	
6.0.....	3400		7.0.....	3800	

Charging rate is varied by adjusting the third brush. The position of the brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate, and in counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes. Main and third brush tension is 1-1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every 2000 miles.

RELAY.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R.P.M. of armature, and opens at 8 1/2 miles per hour, or 900 R.P.M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volts, 21 cp. Dash and tail lamps are each 12-16 volts, 2 cp. Dome lamp is 12-16 volts, 4 cp. All lamps have single contact base.

FUSES.—Field fuse, mounted on generator frame, is 10 amperes.

ANDERSON
Model 41 (1925)
Westinghouse Systems
Plate No. 1015

ANDERSON

MODEL 41 (1925)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-4, 6 volts, 111 ampere-hours capacity. The positive (+) terminal is grounded.

IGNITION.—Type SC. Coil Model No. 288,761. Distributor Model No. 303,018. Breaker contacts separate .011 to .015 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium oilstone.

Oiling.—Place 4 or 5 drops of light engine oil into the oiler on the outside of the breaker box every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—The breaker contacts begin to separate when the top dead center mark on the flywheel is one-half of an inch past indicator. The spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Frame No. 711. Model No. 355,708. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R.P.M., taking 145 amperes. Lock torque is 17 pound-feet, current being 525 amperes, 4.0 volts.

Starter Test Data			
Torque	R.P.M.	Amperes	Volts
2.5 lb. ft.	1250	150	5.5
17.0 lb. ft.	0	525	4.0

Brush tension is 2.5 to 3.0 pounds.

Oiling.—Fill the oil cups with light engine oil every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No 36-ATI, Style No. 355,705. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is employed for current regulation. The maximum charging rate is 16 amperes, reached at 1450 R.P.M. of armature or 28 miles per hour, car speed in high gear.

Generator Test Data			Cold Test		
Amperes	Hot Test R.P.M.	Volts	Amperes	R.P.M.	Volts
0	625	6.5	0	475	6.5
7	950	6.6	8	750	8.0
11	1450	7.7	15-16	1450	8.0

The brush tension is 20-24 ounces.

Oiling.—Place 4 or 5 drops of light engine oil in the generator oil cups every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 302,210. Relay closes at 7.85 M.P.H., or 475 R.P.M. of armature, and opens at 6.7 M.P.H., or 405 R.P.M. The relay contacts separate .035 to .050 inch. The air gap between armature and coil core is .014 to .017 inch, contacts closed.

LAMPS.—Head lamps are 6-8 volts, 21 cp. A dimmer resistance is used. Dash, tail and dome lamps are 6-8 volts, 2 cp.

FUSES.—Generator fuse is 5 amperes. Lighting fuse is 15 amperes.

ANDERSON **MODEL 50 (1925)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM** **REMY IGNITION**

BATTERY.—Willard, Type SJRN-4, 6 volt, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Breaker contacts separate .022 inch. When the condition of the contacts affects the ignition, resurface with a fine flat, jeweler's file or worn No. 00 sandpaper.

OILING.—Refill the cup under the distributor head with soft cup grease and turn down two turns every two weeks. Put a small amount of vaseline on the fiber bumper of the contact arm, applying with a toothpick. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING.—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is $\frac{1}{2}$ inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .025 to .030 inch.

STARTER.—Model No. 705-A. Starter is connected to the engine through a Bendix drive. Starter cranks the engine at 250 R.P.M.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	10000	65	5.0
1 lb. ft.	3000	145	5.4
4 lb. ft.	1000	310	4.5
5 lb. ft.	800	350	4.4
12 lb. ft.	Lock	600	3.0

Above tests are made without the reduction gears.

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model No. 234-E. Generator current regulation is by the third brush system. A thermostat, located in the brush rigging of the generator, cuts a resistance into the field circuit at a temperature of 175°F., reducing the charging rate 6 amperes. The thermostat is intended to change the charging rate as the demands of seasons or car operation requires. Never touch the thermostat points. Maximum current output is reached at 2000 R.P.M. of the armature or 28 miles per hour.

Generator Data

Amperes	R.P.M.	Volts
0	525	6.4
7	780	7.1-7.2
19.5-20.5	1680	8.6
14	1100	7.8
19.0-20.0	2000	8.6
13.0-15.0	3000	8.0

Field winding takes 5 amperes at 6.4 volts. Pressure of main brushes on commutator is 17-20 ounces. Pressure of the third brush is 13-17 ounces. Position of third brush is adjusted by turning a screw exposed in the commutator end plate. Move the third brush in the direction of armature rotation to increase the charging rate, and in the opposite direction to decrease the charging rate. Reseat the brush after adjusting position.

OILING.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 8-10 miles per hour or 525-575 R.P.M. of the armature and opens at 7-9 miles per hour or 475-525 R.P.M. of the armature. Relay contacts separate .012-.015 inch. Air gap between relay armature and coil core is .012-.015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES.—Fuses are 5 ampere.

CADILLAC

MODEL V-63 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY:—Exide, Type 3-LXRV-15-2G. 6 volt, 130 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2179A. Distributor Model No. 5239. Breaker contacts separate .020 inch for new cars; or for a new set of contact arms, and set contact gaps to .015-.018 inch for cars having been driven over 2000 miles on the set of contact arms. They are made of tungsten. If the condition affects ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler every two weeks or each 500 miles. The distributor gears and lower bearings are oiled from the timing gear case. Put a small amount of medium heavy grease on the surface of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when piston on compression stroke is $1\frac{21}{32}$ inches in advance of top center, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1L, 4R, 4L, 2L, 3R, 3L, 2R, 1R.

Spark Plug Gaps.—Spark plug gaps are .023 inch.

STARTER-GENERATOR.—Model No. 98. The direction of rotation is counter-clockwise, viewed from the starter commutator end. The starter cranks the engine at 90-100 R.P.M., taking 140-150 amperes. The starter is connected to the engine through a set of reduction gears meshed by the operator. Lock torque is 6 lb. ft. at 3 volts. Running free the starter takes 70 amperes at 6 volts. The tension of the starter brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

GENERATOR.—Generator current regulation is by the third brush system. The direction of rotation is clockwise, viewed from the generator commutator end.

Amperes	Generator Data.—M.G. 98	R.P.M.
0		420
2		500
15		1000
17-19		1500
13-17		2000

To adjust the charging rate, loosen the generator cover band and the two screws holding the third brush mounting arm. Shift the third brush in the direction of armature rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screws after making the adjustment. The field current is 2.5 amperes at 6 volts. The tension of each of the generator brushes should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds.

Oiling:—Put 8 or 10 drops of light engine oil in each of the motor-generator oilers every two weeks or each 500 miles. Once each year remove and clear the motor and generator clutches and repack with vaseline.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LIGHTING:—Delco Switch Model No. 1272. Head lamps are 6-8 volt, 21 cp. Side and inspection lamps are 6-8 volt, 3 cp. Stop and backing lamps are each 6-8 volt, 21 cp. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker takes the place of fuses. It requires 25 amperes to start the vibrator but 10-15 amperes will cause it to continue. A lock-out circuit breaker protects the horn, backing lamp and signal lamp circuits. A current of 25-30 amperes causes it to open the circuit.

CADILLAC
Model V-63 (1925)
Delco System
Plate No. 1017

H. C. S.
SERIES 4 MODEL 6 (1925)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard, Type SJR-4, 6 volt, 120 ampere-hour. The negative (—) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5259. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oil stone.

OILING.—Put 4 or 5 drops of light engine oil in the distributor shaft bearing every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

TIMING: — Breaker contacts begin to separate when piston No. 1 is one-half inch past top dead center on compression stroke, with the spark control lever and breaker assembly in the fully retarded position.

SPARK PLUGS.—Diameter, $\frac{7}{8}$ inch. Spark gaps are .030 inch.

FIRING ORDER.—The firing order is 1, 4, 2, 6, 3, 5.

STARTER.—Model No. 185. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive. The lock torque is 24 lb. ft. at 2.75 volts. Running free the starter draws 50 amperes at 6 volts. The tension of each of the starter brushes should be from $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

OILING.—Put 5 or 6 drops of light engine oil in the starter oilers every month.

GENERATOR:—Model No. 256. Rotation is counter clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Maximum charging rate is 14 amperes, reached at 1000 R.P.M. of the armature, or 16-20 miles per hour.

Amperes	Generator Data	R.P.M.
Neutral		285
9.5		500
14		1000
12.5		1400
10		2000

Charging rate is varied by adjustment of the third brush setting. To vary the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate must not exceed 17 amperes. The tension of the generator brushes should be from $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

OILING.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 285-300 R.P.M. of the armature or 7-8 miles per hour, and opens at 250-285 R.P.M. of the armature or 5-6 miles per hour. Relay contacts separate .046 to .062 inch. Air gap between relay armature and coil core is .020 to .035 inch, contacts closed. To adjust relay, connect a voltmeter between the positive (+) generator brush and the ground. Then slowly speed up the generator and adjust the relay spring tension by bending the long brass stop until the contacts close when the voltmeter indicates $6\frac{3}{4}$ -7 $\frac{1}{2}$ volts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit-breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating, the current is 10-15 amperes.

DANIELS

MODELS 25-32 AND 25-38 (1925) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone. Manual advance is 18-22°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 13-15° at 2400 R.P.M. The tension of breaker arm spring should be 16-20 ounces.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter 7/8 inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Generator Data

Amperes	R.P.M.
0	600
12	1000
18-22	1450

The shunt field current is 2 amperes at 6 volts. The tension of the generator brushes should be 1 1/2-2 pounds each.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 miles per hour or 500-550 R.P.M. of the armature, and opens at 6 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .040 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7.5 volts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

Switch.—Combination switch is Delco Model 1161.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 10-15 amperes.

DAVIS
Model 91 (1925)
8R Continental Engine
Delco Generating, Starting and Lighting System
Delco Ignition

DAVIS MODEL 91 (1925) 8R CONTINENTAL ENGINE DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-3, 6 volts, 80 ampere-hour capacity. The negative (—) terminal is grounded.

IGNITION.—Ignition Coil Model No. 2178. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline or soft cup grease to the surface of the breaker cam each 2000 miles. Apply a very small amount of vaseline to rotor track in distributor occasionally during the first 2000 miles. The track will then become glazed and no further lubrication is required. It is only necessary to keep the track wiped with a clean cloth. Repack distributor housing with soft cup grease up to the advance ring and yoke once every season.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated by marking "UD" on the flywheel, at indicator on flywheel housing, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug.—The spark plug diameters are 7/8 inch, and the spark plug gaps are .025-.030 inch.

STARTER.—Model No. 181. The starter is connected to the engine by a Bendix. The direction of rotation is clockwise, looking at the commutator end. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 36 amperes at 6 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. Saturate the wick in the oiler on the Bendix gear case with light engine oil once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice each year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature. The third brush system is used for current regulation.

Generator Test Data

Amperes	R.P.M.
5	700
11	1000
14-16 (Max)	1600
15	1800

To adjust the charging rate, remove the cover band and move the third brush mounting plate by means of an extension handle. Shift the third brush in a counter-clockwise direction (direction of rotation) to increase the charging rate, and in the opposite (clockwise) direction to decrease the charging rate. The plate can be held in any position desired by means of friction clamps.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay contact closes at 7-8 volts, or 8-10 M.P.H. and opens at 6-7 M.P.H. with a discharge of three amperes. Contact gap is .025-.035 inch, and the air gap between relay armature and coil core is .025-.035 inch.

LIGHTING.—Combination Switch Model No. 1246. The head lights are each 6-8 volts, 21 cp. Dash and tail lights are each 6-8 volts, 2cp. All lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker, mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate. It will continue to operate with a current flow of not more than the circuit breaker terminals.

KISSEL
Series 55 (1925)

KISSEL SERIES 55 (1925) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJR-4. 6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Model 284-A. Distributor Model No. 626-B. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone. The manual advance is 20°. Automatic advance is 20°.

Oiling.—Turn grease cup two turns and fill oil cup on driving end every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on fly-wheel is 1 1/4 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model 720-D. The direction of rotation, looking at commutator end, is counter-clockwise. Cranking engine at 100-150 R.P.M. it takes 150 to 200 amperes. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
15 lb. ft.	Lock	3.15	570

Starter brush tension should be 20-28 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every month. If car is driven over 1000 miles per month, these attentions must be given every 1000 miles.

GENERATOR.—Model No. 912-B. Direction of rotation, looking at commutator end, is counter-clockwise. Current or voltage regulation is by the third brush and thermostat system. The maximum charging rate is 19-21 amperes, reached at 1800 R.P.M. of armature.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
10-13		1800	7		750
			19-21		1800
			15-18.5		2500

Brush tension is 14 to 18 ounces on all brushes.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—Model No. 264-C. Contacts separate .012 to .015 inch. Air gap between relay contacts and coil core is .012 to .015 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volts, 21 cp. Dimmer lamps are 6-8 volts, 4 cp. Dash lamp is 6-8 volt, 2 cp. Tail lamp is 6-8 volts, 6 cp. Dome lamp is 6-8 volts, 6 cp.

FUSES.—All fuses are 20 ampere.

MERCER

6 CYLINDER MODEL SERIES 6 (1925) WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SPLITDORF MAGNETO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volts, 132 ampere-hours capacity. The starting capacity is 135 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Splitdorf, Type SS, 6 cylinder magneto is used. Breaker contact points separate .020 inch to .024 inch when the fibre bumper is on the highest point of cam.

Oiling.—Put a few drops of light engine oil into each magneto oiler once every 500 miles. **NOTE.**—Do not put more than 2 or 3 drops, rather a drop less than too many, as the oil will gum the mechanism and cause considerable magneto trouble.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center on compression stroke spark control lever and breaker assembly fully retarded. To time the ignition, retard spark control lever and breaker assembly fully with piston No. 1 on compression stroke, rotate magneto drive shaft until the breaker contact points just begin to separate. At this point, connect the magneto to the engine drive shaft.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .020 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter running free, at 3500-6000 R. P. M. of armature, takes a current of 35-45 amperes at 5.5 volts. The lock torque is 17 pound-feet taking a current of 525 amperes, at 4 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 56-AT. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator remove the fibre plate on the front end of the generator housing, loosen the brass nut and move the brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, move the third brush in the opposite direction to rotation (clockwise).

Generator Test Data

Amperes	R.P.M.	Volts
0	500	6.5
8	750	7.5
15-17 (Max)	1100-1600	8.0
7-12	2500	7.0

Generator motoring freely takes a current of 5 amperes at 6 volts. The field draws a current of 2.5 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-500 R.P.M. of armature or 8-10 M.P.H. at 6.5 volts, and opens at 400-450 R.P.M. of armature or 6-8 M.P.H. with a current discharge of 0-3 amperes. The contact gap is .030-.035 inch, contacts fully separated. The air gap between the relay armature and coil core is .015-.025 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dimmer lights are each 6-8 volts, 5 cp. Tail light is 6-8 volt, 4 cp. Dash light is 6-8 volts, 2 cp. All the above lights are of the single contact base type. Limousine dome and corner lights are each 6-8 volts, 2 cp. D. C. Coupe dome light is 6-8 volts, 4 cp. D. C.

MOON

SERIES A (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY: — Exide, Type 3-XC-31-1. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. 2182. The distributor is mounted on the commutator end of the generator. The breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or an a medium hard oilstone.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of grease on the face of the breaker cam every 1000 miles. Once each year, remove the grease plug on the side of the gear housing and repack compartment with medium heavy cup grease.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is on the top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER: — Model No. 286. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter takes 60 amperes at 6 volts. Lock torque is 10 lb. ft. at 3.1 volts. The pressure of the starter brushes should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

OILING: — Oilless bearing are used. They require no attention.

GENERATOR: — Model No. 287 and 296. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 17 amperes, reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
8	1000
17	1600

To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the plate in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. The plate is held in any desired position by means of friction washers. The pressure of the generator brushes on the commutator should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

OILING: — Put 8 or 10 drops of light engine oil in the bearing oiler on the commutator end of the generator every two weeks or each 500 miles.

RELAY: — Model No. 5754. Relay contacts close at a car speed of 8 M. P. H. when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING: — Switch Model No. 1260 and 1264. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp. A dimmer resistance is used.

CIRCUIT BREAKER: — A vibrating circuit breaker, mounted on the back of the switch, takes the place of fuses. A current of 25-30 amperes will cause the circuit breaker to vibrate. While operating the current is 10-15 amperes.

Plate No. 1024

CIRCUIT BREAKER.—Circuit breaker begins to vibrate when the current reaches 25 amperes, and continues to vibrate with 3 to 5 amperes.

MOON

LONDON MODEL (1925) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

MOON
London Model (1925)
Delco Generating, Starting and Lighting System
Delco Ignition
Plate No. 1025

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 100 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Place a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "UD" on flywheel opposite indicator in flywheel housing, spark control lever and breaker assembly in the fully retarded position. To set timing, loosen advance lever clamp screw and turn housing in a counter-clockwise direction until the contacts begin to separate. See that rotor is under contact which is connected to cylinder No. 1. Tighten clamp screw after making adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .030 inch.

STARTER.—Model No. 181.. The starter is connected by a Bendix drive to the engine. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., and takes a current of 125-200 amperes at 5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
40-50	5.5	Running Free	4500
450-550	2.75	27 lb. ft.	Lock

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every 1000 miles or each month. Saturate the wick in the oiler on the Bendix gear case once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice a year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band on the commutator end of generator housing, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (clockwise) of rotation. The third brush plate is held in any position by means of a friction clamp. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data

Amperes	R.P.M.
5	700
11	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-550 R.P.M. or 6-8 M.P.H., at 7 volts, and opens at 400-450 R.P.M., with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, contacts fully separated. The air gap is .025-.035 inch, with the contacts fully closed.

LIGHTING.—Combination Switch No. 1239 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary headlights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate, and will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

MARMON

MODEL D-74 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 617-SHC, 6 volt, 170 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2177. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on the flat side of a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in each distributor oiler every two weeks or each 500 miles. Pack the distributor gear housing up to the level of the distributor gears with medium heavy cup grease twice each year. Place a small amount of grease about the size of a match head on the breaker cam and polish the rotor track with a small amount of grease every 1000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is on top dead center on compression stroke with spark control lever advanced $5\frac{3}{4}$ inches from the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. Then loosen timing adjustment screw and turn the the breaker cam until contact points just begin to separate. Tighten the adjustment screw and replace the distributor head, being careful that the rotor button is directly under the segment connected to the spark plug of cylinder No. 1.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model No. 254. The starter is connected to the engine through a mechanically operated pinion shift combined with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Test Data

Torque	Amperes	Volts
0	60	6
24 ft. lbs.	Lock	2.75

Brush pressure on all brushes should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two starter oilers every 1000 miles or each month. Saturate the wick in the oiler in the starter end gear with engine oil once each year. Clean and repack the motor clutch with vaseline every year.

GENERATOR.—Model No. 253. Generator current regulation is by the third brush system. The direction of rotation is clockwise, looking at the commutator end. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the generator.

Generator Test Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
4	800	4	800
9	1000	8	1000
15-18	1600	14-16	1600
17	2000	15	2000

To adjust the charging rate, remove the cover band and shift the third brush plate by means of the handle. Shifting the third brush in the direction of the armature rotation (clockwise) increases the output and in the opposite direction (counter-clockwise) decreases the output. The third brush plate is held in any desired position by means of friction clamp washers. The brush tension of all brushes is $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two generator oilers every 500 miles or each two weeks.

RELAY.—Model 5754. Relay is mounted on top of the generator. Relay closes at 6-8 miles per hour or $6\frac{3}{4}$ to $7\frac{1}{2}$ volts and opens with a discharge current of 0 to 3 amperes. Relay contacts separate .025 to .035 inch. Air gap between the relay armature and the coil core is .025 to .035 inch, contacts closed. To raise the cut-in voltage increase the spring tension and to lower the cut-in voltage decrease the gap.

LIGHTING.—Combination Switch Model No. 1273. Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps and tonneau lamp are each 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C. Stop light is 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 2 cp. D.C.

CIRCUIT-BREAKER.—A vibrating circuit-breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

Plate No. 1026

OLDSMOBILE.
Model 30 (1925)
Delco System.

OLDSMOBILE

MODEL 30 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY:—Willard, Type XW-13, 6 volt, 80 ampere-hour. The lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model Number 5273. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil stone or with a fine flat jeweler's file.

OILING:—Put 8 or 10 drops of light engine oil in the distributor oiler every month or each 1000 miles. Once each year remove the grease plug in the gear housing and fill the housing with medium heavy cup grease. Place a small bit of medium heavy cup grease on the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position .055 inch (measured on the flywheel) before top dead center. To time engine, loosen clamp nut on distributor housing and turn distributor cup in a counter-clockwise direction until contacts begin to separate. Then tighten the clamp nut. Make certain that the rotor is under the high tension terminal connected to cylinder No. 1.

FIRING ORDER:—The firing order is 1,5,3,6,2,4.

SPARK PLUG GAPS:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER:—Model No. 274. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is clockwise looking at the commutator end. Starter cranks the engine at 175 R. P. M. taking 150 amperes at 6 volts. Lock torque is 10 pound feet at 3.1 volts. Starter running free takes 60 amperes at 6 volts. The tension of each of the starter brushes should be from $\frac{2}{4}$ to $\frac{3}{4}$ pounds.

OILING:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

GENERATOR:—Model No. 295. Generator current regulation is by means of the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 12 amperes reached at 1665 R. P. M. of the armature or 18-24 miles per hour, car speed in high gear.

Generator Data.

Cold Test (65°)			Hot Test (200°)

OILING: —Put 8 or 10 drops of light engine oil in the oiler on the commutator end					
14	6.25	1665	8		1000
			12	6.25	1665

To adjust the generator output, loosen the commutator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of rotation (counter-clockwise) increases the charging rate while moving it in the opposite direction (clockwise) decreases the charging rate. The field current is 3 amperes at 6 volts. The tension of the generator brushes should be from $1\frac{1}{2}$ to $1\frac{3}{4}$ pounds each.

of the generator every month or each 1000 miles.

RELAY:—No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Shutting off the ignition disconnects the generator and prevents the battery from discharging.

LIGHTING:—Combination Switch Model No. 1273. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

WESTCOTT

MODEL H-44 (1925).

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:--Willard, Type SJR-4. 6 volt, 110 ampere hour. The negative (—) terminal is grounded.

IGNITION:--Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file, finishing on a hard oilstone.

Oiling.--Put 8 or 10 drops of light engine oil in each of the distributor oilers every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Place a bit of medium heavy cup grease on the face of the breaker cam. These attentions should be given every 500 miles or each two weeks.

Timing.--Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

Firing Order.--The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.--Spark plug gaps are .030 inch.

STARTER.--Model No. 181. The starter is connected to the engine by a Bendix drive. Lock torque is 27 pound feet at 2.75 volts. Starter running free takes 36 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The brush tension should be from 2¼ to 2¾ pounds on each brush.

Oiling.--Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Remove the grease plug and repack the reduction gear housing with medium heavy cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil once each year.

GENERATOR.--Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the armature.

Generator Data

Amperes	R.P.M.
4.....	800
8.....	1000
17.....	1600
15.....	2000

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the third brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of the generator brushes should be from 1¼ to 1¾ pounds each.

Oiling.--Put 8 or 10 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.--The relay is mounted on the generator frame. The relay contacts close at 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The gap between the relay armature and the coil core is .015 to .020 inch. To raise the cut-in voltage, increase the spring tension by bending the long brass stop or increase the gap by bending the short brass stop. To lower the cut-in voltage, decrease the gap or the spring tension.

LAMPS.--Combination Switch No. 1246. Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 3-4 volt, 2 cp. Dome lamp is 6-8 volt, 5 cp.

CIRCUIT-BREAKER.--A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25 to 30 amperes to start it vibrating. While vibrating the current is 3-5 amperes.

Plate No. 1029

WESTCOTT

MODEL H-60 (1925).

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY:—Willard, Type SW-15. 6 volt, 120 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file, finishing on a hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in each of the distributor oilers every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Place a bit of medium heavy cup grease on the face of the breaker cam. These attentions should be given every 500 miles or each two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is 1 inch past top dead center (measured on the flywheel), spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 181. The starter is connected to the engine by a Bendix drive. Lock torque is 27 pound feet at 2.75 volts. Starter running free takes 36 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The brush tension should be from 2¼ to 2¾ pounds on each brush.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Remove the grease plug and repack the reduction gear housing with medium heavy cup grease every six months. Saturate the wick oiler in the end of the Bendix gear case with light engine oil once each year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The maximum charging rate is 17 amperes, reached at 1600 R.P.M. of the armature.

Generator Data

Amperes	R.P.M.
4	800
8	1000
17	1600
15	2000

To adjust the charging rate, loosen the generator cover band and shift the third brush mounting plate by means of the handle. Moving the third brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite (clockwise) direction decreases the charging rate. The brush tension of the generator brushes should be from 1¼ to 1¾ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles.

RELAY.—The relay is mounted on the generator frame. The relay contacts close at 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The gap between the relay armature and the coil core is .015 to .020 inch. To raise the cut-in voltage, increase the spring tension by bending the long brass stop or increase the gap by bending the short brass stop. To lower the cut-in voltage, decrease the gap or the spring tension.

LAMPS:—Combination Switch No. 1244. Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

CIRCUIT-BREAKER.—A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. It requires a current of 25 to 30 amperes to start it vibrating. While vibrating the current is 3-5 amperes.

RICKENBACKER

MODEL D (1925)

BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM BOSCH IGNITION.

BATTERY.—U. S. L., Type 3CVX-6X, 6 volt, 108 ampere-hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-6248. Breaker contacts separate .020 inch. If the condition of the contact points affects the ignition remove and resurface on a medium hard oilstone.

Oiling.—Fill oil cup on distributor housing every two weeks. Place a few drops of light engine oil on the interrupter lever every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a very small amount of vaseline on breaker cam every 1000 miles.

Timing.—Breaker contacts just begin to separate when mark "0" on the front fly-wheel is directly in the center on top with piston No. 1 on compression stroke; spark control lever and breaker assembly in the fully retarded position. To set the timing see that the spark lever and breaker assembly are fully retarded, then loosen the screw in the center of the cam and turn cam until the contact points just begin to separate.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs.—Spark plug diameters are 7/8 inch, gaps are .022-.025 inch.

STARTER.—Model No. 933 CWDE. The direction of rotation is counter-clockwise looking at commutator end. The starter is connected to the engine by means of a manually operated shift equipped with an overrunning clutch. The starter cranks the engine at 150 R.P.M., taking 125-150 amperes at 6 volts. Brush tension is 2 3/4-3 1/2 pounds.

Starter Test Data

Torque	R.P.M.	Volts	Amperes
0	2500	6	70
12	(0) Lock	4	500

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 1032. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is employed for current regulation. To increase the out-put, loosen the hexagon nut inside of generator or third brush housing and move brush in counter-clockwise direction; to decrease charging rate, move in clockwise direction. Maximum charging rate is 15 amperes, reached at 1600 R.P.M. or 20 M.P.H., car speed in high gear.

Generator Test Data.

Cold Test. (20°C)			Hot Test. (85°C)		
0	6.5	600	0	6.4	600
5	6.75	700	7	7	1000
10	7.2	1000	9	7.2	1300
12	7.4	1200	8-10	7.4	1650
14-15	7.5	1600	8.6	7.4	2400
11.5	7.4	2400			

The brush tension should be 2 1/4 to 2 3/4 pounds each.

Oiling.—Fill oil cups with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Model No. 1032-CWDE. Relay closes at 7.5 M.P.H. or 600 R.P.M. of armature at 6.5-7.0 volts and opens at 450 R.P.M. or 5-6 M.P.H. or 0-2 amperes discharge. The contact gap is .015-.020 inch. Air gap between relay armature and coil core is .010 inch.

LIGHTING.—Head lamps are 6-8 volt, double filament bulb, 21 and 2 cp. D.C. Dimmer lamps are 6-8 volt, 2 cp. Dash, tail and side lamps are each 6-8 volt, 2 cp. S.C. Stop light is 6-8 volt, 21 cp. S.C. Combination switch—Basco No. 2276.

FUSES.—Two 20 ampere fuses are used. Generator field fuse is 5 ampere.

RICKENBACKER
Vertical Eight (1924-25)
American Bosch System
Delco Ignition.

Plate No. 1031

RICKENBACKER

MODEL A-8 (1924-25) SERIAL NOS. 25000 UP.
AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY:—U. S. L. Type 3-HVX-8X. 6 volt, 166 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 5276. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Contacts arm spring tension should be 16-20 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks, or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of medium heavy grease or vaseline on the surface of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. Manual advance is 25°. Automatic advance starts at 850 R.P.M. and reaches a maximum of 22° at 3600 R.P.M.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 947. Starter is connected to the engine through a manually operated pinion shift and overrunning clutch. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. taking 120 amperes at 5.65 volts.

Starter Data			
Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	1800	6	60
.....	120	5.4	120
Lock.	0	5	550

Oiling:—Self-lubricating bearings are used. They require no attention.

GENERATOR:—Model No. 1055. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. To adjust the generator output, loosen the screws holding the inner generator end plate upon which the third brush is mounted and shift the third brush. Moving the brush in the direction of generator rotation (counter-clockwise) increases the output and in the opposite direction decreases the output. Tighten the screws after making the adjustment. The maximum charging rate is 12-14 amperes reached at 1600 R.P.M. of the generator armature or 30 M.P.H.

Cold Test. (20°C)			Hot Test (85°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.5	600	0	6.4	600
5	6.75	700	7	7	1000
10	7.2	1000	9	7.2	1300
12-14	7.5	1600	8-10	7.4	1650
11.5	7.4	2400	8.6	7.2	2400

Generator shunt field draws 2 to 2.5 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each generator oiler every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close at approximately 500 R.P.M. of the generator armature with a generator voltage of 6.5 to 7.5 volts and open at 450 R.P.M. or 5 to 6 M.P.H. with a discharge current of 0 to 2 amperes. Relay contacts separate .015 to .020 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 and 2 cp. D.C. (Double filament). Stop lamp is 6-8 volt, 21 cp. S.C. Dash, dome, side and tail lamps are 6-8 volt, 2 cp. S.C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuse is 20 ampere.

STUDEBAKER

STANDARD SIX
MODEL ER (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard Type SJRN-3.—6 volt 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-S. Distributor Model 626-K. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The distributor is of the full automatic type. Automatic advance is 25°.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing:—Breaker contacts begin to separate when the flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To adjust timing, loosen the nut on top of the breaker cam and pry up the cam with a screw driver. Then rotate the cam in a counter-clockwise direction until the contacts begin to separate. Tighten the nut. A fine adjustment can be made by loosening the screw on the breaker plate and rotating the plate, a graduated scale being provided to gauge the movement. Tighten the screw after making the adjustment.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 720-M. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush pressure should be 20-28 ounces each.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0 lb. ft.	5	65	6000
15 lb. ft.	3.15	570	Lock

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

GENERATOR.—Model 917-A. Generator current regulation is by the third brush system. Thermostat opens at 195° to 200° F., cutting down the maximum charging rate to 11 amperes. The direction of rotation is counter-clockwise, looking at the commutator end.

Cold Test		Generator Data		Hot Test	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.1	850	6-9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator bearing oilers every month. If the car is driven more than 1000 miles in a month, this oiling must be done every 1000 miles.

RELAY.—Model No. 264-B. Relay closes at 8-10 miles per hour, and opens at 6-8 miles per hour. Air gaps between relay armature and coil core is .012 to .015 inch, contact points closed. Contact opens .012 to .015 inch. Adjust spring tension by bending brass strip through which spring passes. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp.S.C. Dash, tail and side lamps are each 6-8 volt, 2 cp.S.C. Dome, stop and corner lamps are each 6-8 volt, 4 cp.S.C.

FUSES.—Fuses are 10 ampere.

STUDEBAKER

MODELS EP AND EQ (1925)

BIG SIX AND SPECIAL SIX

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJR-4, 6 volts, 111 ampere-hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-S. Distributor Model No. 626-L. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type. Automatic advance is 24°.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing:—Breaker contacts begin to separate when flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the nut on the top of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to open. Then tighten the nut. For close setting loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model No. 723-A. Starter is connected to the engine through a chain drive and an overrunning clutch. The direction of rotation is clockwise, looking at the commutator end.

Starter Test Data			
Torque	Volts	Amperes	R.P.M.
0	5	70	1000
70	3.25	600	Lock

The starter brush pressure should be 20-28 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles. Once each year remove the grease plug in the reduction gear case and repack with graphite cup grease. Every three months oil the starter clutch in the sprocket on the engine crankshaft with light engine oil through the oil hole on the forward side.

GENERATOR.—Model No. 917-E. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. A thermostat in the shunt field circuit cuts in a resistance that lowers the generator output approximately 50%.

Generator Data

Cold		R.P.M.	Hot		R.P.M.
Amperes	Volts		Amperes	Volts	
0	Cut in	675			
7	7.1	850	6.9		1450
18-20	8.3-8.8	1800	11	8.2	1900
17-10		2500			

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Oiling:—Put 4 or 5 drops of light engine oil in each generator oiler every 1000 miles.

RELAY.—Model 263-F. Relay is mounted on the dash. Relay contacts close at 8-10 M.P.H. with a generator voltage of 7.2 volts and open at 6-8 M.P.H. with a discharge current of 0-2.5 volts. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp. S. C. Dash, tail and side lamps are each 6-8 volt, 2 cp. S. C. Tonneau, stop and dome lamps are each 6-8 volt, 4 cp. S. C.

FUSES.—The fuses are 10 amperes

STUDEBAKER

Remy Systems

Plate No. 1033

CHRYSLER SIX

MODEL B (1925) SERIAL NOS. 32000 UP.

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—Willard, Type CRR-15. 6 volt, 100 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284A. Distributor Model 656B. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. A double set of breaker contacts are used. They must be synchronized to open together.

Oiling.—Refill the grease cup under the distributor head with soft cup grease and turn down one turn every two weeks. Place a very small amount of vaseline on the surface of the breaker cam and wipe out the distributor head with a clean cloth every two weeks. If the car is driven more than 500 miles in two weeks, these attentions must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position 14° before top dead center (measured on the flywheel) when the flywheel marking "AD-SP" is opposite the indicator mark on the clutch housing with the spark control lever and breaker assembly in the fully advanced position. To set timing, crank the engine until piston No. 1 reaches this position. Then loosen the clamp screw which holds the timing lever to the distributor and after fastening the lever to the bracket on the cylinder head, rotate the distributor in a counter-clockwise direction until the breaker contacts begin to separate. Then tighten the clamp screw.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER.—Model 722-B. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 115 R.P.M., taking 125 amperes at 5.48 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0	2500	70	5.
5.6 lb. ft.	660	200	5.2
10.7 lb. ft.	365	300	4.6
16.8 lb. ft.	200	400	4.0
28 lb. ft.	Lock	570	3.15

Starter brush tension should be 20-28 ounces each.

Oiling.—Put a few drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. 917-T. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18-20 amperes (generator cold) reached at 1900 R.P.M. of the armature or 24-26 M.P.H., car speed in high gear.

Generator Test Data

Amperes	Hot Test Volts	R.P.M.	Amperes	Cold Test Volts	R.P.M.
9-12	8.0-8.5	1900	18-20	8.3-8.5	1900

To adjust the generator output, remove the commutator cover band and loosen the third brush ring clamp screw. Then move the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and the opposite (clockwise) direction to decrease the charging rate. Tighten the screw after making the adjustment. Motoring freely at 350 R.P.M. generator 5.1 amperes at 5.55 volts. Shunt field current is 4-5.9 amperes at 6 volts. Generator brush tension should be 22-28 ounces each.

Oiling.—Put a few drops of light engine oil in each of the generator bearing oilers every 1000 miles or each month.

RELAY:—Model No. 265A-B. Relay closes at 675 R.P.M. of the generator at 10.5 M.P.H. with a generator voltage of 7.2 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Combination Switch Model 474-B. Head and stop lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. Tail lamp is 6-8 volt, 2 cp. S. C. Dash, and tonneau lamps are 6-8 volt, 3 cp. S. C.

FUSES.—Lighting circuit fuses are 10 amperes capacity.

NOTE.—Connections as shown are for closed cars. On open cars the dotted connection takes the place of the line A-5.

MAXWELL
Model 25 (1925)
Remy System

Plate No. 7035

MAXWELL

MODEL 25 (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—Westinghouse, Type 6-OB-13. 6 volt, 105 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 21 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 284-L, Distributor Model No. 369C. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface them on a medium hard oilstone.

Oiling:—Fill distributor grease cup with soft grease and turn down two or three turns once a month. If car is driven over 1000 miles in a month, this attention must be given once to every 1000 miles.

Timing:—Contact points begin to separate when No. 1 piston is $\frac{3}{64}$ of an inch past top dead center on power stroke; as measured on flywheel is 10 degrees past top dead center, spark control lever and breaker assembly fully retarded. To adjust points to open at this position, loosen clamp which locks sparks lever to distributor head, and rotate distributor head until points begin to open with rotor under segment connected to spark plug No. 1.

Firing Order:—The firing order is 1, 3, 4, 2.

Spark Plugs:—Spark plug diameters $\frac{7}{8}$ inch. Gaps are .027-.030 inch.

STARTER:—Model 712-B. The direction of rotation is counter-clockwise, looking at commutator end. The connection to engine is by a Bendix drive. The motor running free at 5000 R.P.M. taking 65 amperes at 5 volts. Cranking engine at 150 R.P.M. requires 150 amperes at 5 volts. Lock torque is 11 pound feet with 450 amperes at 3.6 volts. Starter brush tension is 20-24 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil into starter oiler once a month. If car is driven over 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR:—Generator Model 961-A. The direction of rotation, looking at commutator end is counter-clockwise. Generator running freely at 440 R.P.M. takes 6.5 amperes at 7.1 volts. Shunt field current is 5 amperes at 6 volts. The third brush system is used for current regulation. To adjust generator output, loosen locknut on outside of generator end plate and shift the third brush. Moving the brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the output. Before adjusting charging rate, make certain that fan belt is not slipping. If the fan moves even part of a revolution when the relay points are closed or if a higher speed than 20-25 M.P.H. is required to reach the maximum charging rate the fan belt is loose and slipping.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
7	7.1	925			
15-17	8.1	1800	11	7.85	1975

Generator brush tension should be 22-28 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles or each month.

RELAY:—Relay points close 8-10 M.P.H., 7 volts; and opens at 7-8 M.P.H., 0-3 amperes discharge. Relay contacts separate .014-.025 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Combination Switch Model 1265-A. Head and stop lamps are 6-8 volt, 21 cp. S. C. Dash, tail and dome lamps are each 6-8 volt, 3 cp. S. C. Side lamps are 6-8 volt, 2 cp. S. C.

FUSES:—Fuses are 20 amperes.

FOX
Model 7F (1925)
Westinghouse Generating, Starting, and Lighting System
Scintilla Magneto Ignition
Plate No. 1036

FOX

MODEL 7F (1925), SERIAL NOS. 150 UP. WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM SCINTILLA MAGNETO IGNITION

BATTERY:—Westinghouse, Type 6-C-17. 6 volt, 120 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Scintilla Magneto Model AM-6. Breaker contacts separate .010 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone, as they are made of tungsten.

Oiling:—Put 4 or 5 drops of light engine oil into each of the two oil wells every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 is on compression stroke, marking "45" on flywheel housing on top dead center, spark control lever and breaker assembly fully advanced.

Firing Order:—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Frame No. 751. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter cranks the engine at 100-150 R.P.M. taking a current of 175-225 amperes, at 5-5.5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
38-52	5.5	0	3100-3800
650	4.0	21 lb. ft.	0 (Lock)

Oiling:—Put 4 or 5 drops of light engine oil in each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR:—Frame No. 760. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator loosen the nut inside of the generator end bracket opposite the third brush and move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data

Amperes	R.P.M.
0	450
8	675
15-17	1250
10	2000

Generator motoring freely, takes a current of 3.5-5 amperes, at 6-6.6 volts and the field draws a current of 2.5 amperes, at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil into the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Relay closes at 500-550 R.P.M. or 8-10 M.P.H. at 6.2-6.5 volts, and opens at 450-500 R.P.M. or 6-8 M.P.H. with a current discharge of 0-3 amperes. The contact gap is .015-.019 inch, and the air gap between relay armature and coil core is .055-.060 inch.

LIGHTING:—Clum Combination Switch is used. The head lights are each 6-8 volts, 21 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Side and tail lamps are 6-8 volt, 4 cp. S. C. Dash and dome lamps are each 6-8 volt, 2 cp. D. C. Stop and backing lamps are 6-8 volt, 21 cp. S. C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuses are 15 ampere.

WILLS SAINT CLAIRE MODELS B-68 AND C-68 (1925) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5235. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oil-stone. Two sets of contacts are provided. They operate with a four sided cam and open separately. Each breaker cam controls one coil and fires one bank of cylinders. The distributor is provided with manual and automatic advance. Manual advance is 45-50°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-22° at 2000 R.P.M. The breaker arm spring tension is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of medium heavy grease on the breaker cam and on the track in the distributor head every 1000 miles. After polishing the rotor track with a clean cloth, remove all excess grease.

Timing.—Breaker contacts firing right bank of cylinders begin to separate when piston No. 1 entering power stroke reaches a position 7° past top dead center (measured on flywheel) with the spark control lever and breaker assembly in the fully retarded position. This position is reached when the flywheel marking EC-1 is slightly past the indicator. Breaker contacts firing the left bank open when piston No. 8 reaches a similar position. The engine fires at intervals of 60 and 120° corresponding to 30 and 60° of distributor travel. These intervals must be accurately set. This may be done by connecting a test lamp in each circuit and noting the exact moment the contacts separate. If small scratches are made on the distributor housing opposite the rotor when the contacts separate the firing intervals can be measured. The straight line distances between the marks should be 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Firing Order.—Right hand bank of cylinders are numbered 1-2-3-4 from the radiator. Left hand bank are 5-6-7-8. Firing order is 1-8-2-7-4-5-3-6.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER GENERATOR.—Model 207. Starter cranks the engine at 100 R.P.M. Current required to break away is 265 amperes. While cranking starter draws 50-75 amperes. Rotation is clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 lb. ft.	Lock	3	

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens 190-200° F., cuts in Res., reducing charging rate 50 per cent.

Generator Data—No. 207

Amperes	Cold	R.P.M.	Amperes	Hot	R.P.M.
0		575-600	0		750-800
8-10		1000	1-2		1000
16-18		1500	6-8		1500
18-20		2400	11-13		2400

To adjust the charging rate, loosen cover band and locknut on the generator commutator end and shift the third brush mounting plate by means of the handle. To increase the charging rate shift the third brush in the direction of armature rotation and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Every 1000 miles apply heavy grease to starting gear shaft through fitting in rear end of shaft and apply heavy oil to the generator clutch through oiler in top of housing. Once each year remove, disassemble and clean generator and motor clutches. Repack with vaseline.

RELAY.—There is no relay. The circuit between the battery and generator is controlled by the ignition switch.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Switches.—Combination switch is Model 1259.

FUSES.—A vibrating circuit breaker takes the place of fuses. It requires a current of 25-30 amperes to start this device. While vibrating the current is 10-15 amperes.

PAIGE-DETROIT

MODELS 21-24 (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY:—Westinghouse, Type 6-OB-19. 6 volt, 155 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model N-3. Distributor Model L-A. The breaker contacts separate .015 inch. When the condition of the contact points affects the ignition, remove and scrape with a penknife or resurface on a medium hard oilstone.

Oiling:—Fill oil cup under breaker head with light cylinder oil every two weeks. Apply a small amount of vaseline on the breaker cam once every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 is on power stroke, mark "IN-OP-6" on the flywheel is opposite the indicator. Spark control lever and breaker assembly fully retarded.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—The spark gaps are .020-.025 inch.

STARTER:—Model No. 722-A. The starter is connected to the engine through a set of reduction gears and Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is mounted by means of an S.A. E. barrel type mounting.

Starter Test Data

Volts	Amperes	R.P.M. (of Bendix)	Torque
5	70	2500	0 lb. ft.
3.15	570	Lock	28 lb. ft.

The brush tension is 20-28 ounces.

Oiling:—Fill oil cup at each end of starter with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles.

GENERATOR:—Model No. 917-V. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. Shift the third brush in the direction of generator rotation to increase the charging rate and in the opposite direction to decrease the charging rate. A thermostat is in series with the shunt field. With the thermostat contacts open the output is cut down approximately 50%.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
7	7.2	850			
19	8.4	1900	11	7.5	1900

Shunt field current is 5 amperes at 6 volts. Brush tension is 22-28 ounces each.

Oiling:—Fill oil cups at each end of the generator housing with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY:—Model 266-F. Relay is mounted on top of the generator. Relay closes at 675 R.P.M. of the generator armature with a generator of 7.25 volts and opens with a discharge current of 0 - 2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LAMPS:—Head and signal lamps are 6-8 volts, 21 cp., S.C. Auxiliary head and dash lamps are 6-8 volts, 4 cp., S.C. Side and tail lamps are 6-8 volts, 2 cp. S.C. Trouble lamp is 6-8 volts, 4 cp., D.C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuses are 20 ampere.

JEWETT

MODEL 23-25 (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER-KENT IGNITION

BATTERY:—Westinghouse, Type 6-OB-13. 6 volt, 115 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model N-3. Distributor Model L-A. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, gently scrape with a penknife or resurface on a hard oilstone.

Oiling.—Refill the distributor oiler with medium cylinder oil every 100 miles. Also place a small amount of vaseline on the breaker cam at the same time.

Timing.—Breaker contacts begin to separate when piston No. 1 entering firing stroke, and mark I.O.-1-6 is 1½ inches past indicator, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .020-.025 inch.

STARTER:—Model 713-C. Starter is connected to the engine a Bendix drive. The direction of rotation, looking at commutator end, is counter-clockwise. Brush tension is 28-32 ounces each.

Starter Test Data

R.P.M.	Torque	Amperes	Volts
5000	0 lbs. ft.	65	5.0
Lock	12 lbs. ft.	475	3.6

Oiling.—Fill oil cup on each end of starting motor with light cylinder oil every 500 miles.

GENERATOR:—Model No. 917-U. The direction of rotation, looking at commutator end, is counter-clockwise. Generator current regulation is by the third brush system and thermostat control. Maximum charging rate is 20 amperes, at 8.5 volts, at 1800 R.P.M. The field draws 5 amperes at 6 volts.

Generator Test Data

Hot Test			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
11	8.2	1900	0	—	675
			7	7.1	825
			20	8.5	1800

To adjust the charging rate, shift the third brush. Moving the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The brush tension should be 16 ounces on each brush.

Oiling.—Fill oil cup at each end of generator with light engine oil every two weeks. If car is driven more than 500 miles in two weeks this care must be given every 500 miles.

RELAY:—Model Number 266-F. Relay closes at 7.25 volts or 675 R.P.M. of armature, and opens at 6 volts. Relay contacts separate .014 inch. Air gap between armature and coil core is .014 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface on a hard oilstone.

LAMPS.—Head lamps are 6-8 volt, 21 cp., S.C. Dimmer lamps are 6-8 volt, 4 cp., S.C. Tail lamp is 6-8 volt, 2 cp., S.C. Dash lamp is 6-8 volt, 2 cp., D.C. Dome lamp is 6-8 volt, 4 cp., D.C.

FUSES.—Generator field fuse is 5 ampere. Lighting circuit fuse is 20 ampere.

Great Line Eight (1924-25)
American Bosch System
Plate No. 1040

JORDAN GREAT LINE EIGHT MODEL A (1924-25)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Willard, Type CR-15. 6 volt, 115 ampere hour. The negative (—) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-8202. Breaker contacts separate .014 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil once each month or every 1000 miles, if the car is driven more than 1000 miles in a month. Put one drop of oil on the interrupter lever pivot and place a small bit of grease on the interrupter cam under the fibre bumper every three months.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the half advanced position.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 937. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 93 R.P.M.

Starter Data.

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	2000	6	60
28 lb. ft.	Lock	3.5	500

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 1261. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, remove the end-plate and loosen the slotted hexagon head screw which holds the third brush plate in position. Then move the third brush in a counter-clockwise direction (toward the engine) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 16-18 amperes (cold) is reached at 1300 R.P.M. of the generator armature or 23 M.P.H.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.75	550	0	6.5	625
7	7.	700	2.5	6.5	700
12	7.6	850	8	7.5	900
17	8.	1300	13	8.	1300
12.6	8.	2000	11	8.	2000
9.5	7.6	2800	9	7.	2800

Motoring freely the generator takes 6 amperes at 6 to 6.5 volts. The shunt field draws 6.1 to 6.8 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month, or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay is mounted on top of the generator. Relay closes at 500-600 R.P.M. when the generator voltage reaches 6.5 to 7.5 volts and opens at 400-500 R.P.M. with a discharge current of 0 to 3 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed. Clean relay contacts by drawing well worn No. 00 sandpaper between them. Remove all grit and adjust before again putting into service.

LIGHTING:—Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C. A vibrating circuit breaker protects all lighting circuits and horn circuit. The ignition current does not pass through the circuit-breaker.

FUSES:—Generator field fuse is 7.5 ampere capacity.

FLINT

MODEL 6-40 (1925)

AUTO-LITE, GENERATING, STARTING AND LIGHTING SYSTEM.

AUTO-LITE IGNITION.

BATTERY: — U. S. L. 3-HVX-5X, 6 volt, 92 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model 1G-4047. Distributor Model 1G-4003-A. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil stone.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is on top dead center, with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are $\frac{7}{8}$ inch, SAE standard. Gaps are .022 to .025 inch.

STARTER: — Model MG-4004. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 160 R. P. M. taking 145 amperes at 5.3 volts.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
1 lb. ft.	2300	5.5	100
3 lb. ft.	1200	5.0	200
5.9 lb. ft.	650	4.5	300
8.7 lb. ft.	150	4.0	400
18 lb. ft.	Lock.	5.0	650

The starter brush tension should be $2\frac{1}{4}$ to 3 pounds each.

OILING: — The commutator end of the starter is fitted with an oilless bearing. Put 4 or 5 drops of light engine oil in the oiler at the drive end of the starter every two weeks or each 500 miles.

GENERATOR: — Model GJ-4014. The direction of rotation is counter-clockwise, looking at the commutator end of the generator. Current regulation is by the third brush system. To adjust the charging rate turn the third brush shifting screw located on the generator end plate. Turning the screw to the right increases the charging rate, and to the left decreases the charging rate. The maximum charging rate of 16 amperes is reached at 1700 R. P. M. of the armature or 25 M. P. H. car speed in high gear.

Generator Data

Cold Test. (25°C)			Hot Test (75°C)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

The generator running freely as a motor at 300-400 R. P. M. takes 3.24-4.0 amperes at 6.35 volts. Shunt field current is 1.9-2.2 amperes at 6.2 volts. A single coil will draw 7.6 to 8.8 amperes at 6.2 volts. The brush tension should be $1\frac{1}{2}$ -2 pounds each.

OILING: — The front bearing is oiled by the splash from the chain case. Put 4 or 5 drops of light engine oil in the oiler on the rear end of the generator every two weeks or each 500 miles.

RELAY: — Auto-Lite. Model CB-4009. Relay closes at 600 R. P. M. of the armature at 8.9 M. P. H. with a generator voltage of 7-9 volts, and opens at 400 R. P. M. or 6 M. P. H. with a discharge current of $\frac{1}{2}$ to $2\frac{1}{2}$ amperes. Relay contacts separate .025-.035 inch and the air gap between relay armature and coil core is .015-.030 inch, contacts closed.

LIGHTING: — Clum Combination Switch. Head and stop lamps are 6-8 volt, 21 cp. Dash, tail and side lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

FUSES: — No generator field fuse is used. Lighting fuse is 20 amperes.

Westinghouse Systems
Plate No. 1043

GRAY

MODEL 0 (1925)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY.—U. S. L., Type CDX-311-X, 6 volt, 84 ampere hour. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION.—Type SC. Breaker contacts separate .012-.016 inch, fully separated. The are made of tungsten. If the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—See generator oiling.

Timing.—Breaker contacts begin to separate when piston No. 1 is $\frac{7}{32}$ inch before top dead center entering power stroke with the spark control lever and breaker assembly in the fully advanced position.

Resistance of primary coil is 1 ohm. The distance from the distributor arm to carburetor bowl should not be less than $\frac{1}{4}$ of an inch.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .030 inch.

STARTER.—Frame No. 33-AB. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator current of 35-45 amperes, 5.5 volts. Cranking the engine at 100-150 R.P.M., takes end of the motor. Motor running free at 4100-4700 R.P.M. of armature takes a current of 150-200 amperes, 5-5.5 volts. The lock torque is 12 pound-feet, the current being 474 amperes, 4 volts.

Oiling.—Place 4 or 5 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

GENERATOR.—Frame No. 34-AT1. The direction of rotation is counter-clockwise, looking at commutator end. The generator motoring freely takes 3-4 amperes at 6-6.3 volts. The shunt field current is 2.5-3.2 amperes, 6-6.3 volts. The third brush system is used for current regulation. To increase the generator output, loosen the screws on the rear end of generator bracket, and move the third brush in the direction of armature rotation (counter-clockwise). Move against the direction of rotation or in clockwise direction to decrease the charging rate.

8-11	1500	7.5	12-14	1400-1600	7.5
7-9	2500	7-7.5	9-11	2500	7.0-7.5

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles. The bearing on the drive end of the generator is oiled by the splash from the gears.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7 to 9 miles per hour, or 6-5 volts, and opens at 450-500 R.P.M. of armature, or 5 to 7 miles per hour, or 0-2 amperes discharge. Relay contacts separate .030 inch. The air gap between the relay armature and coil core is .012-.015 inch. The shunt coil resistance is 68 ohms.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. Dash, dome, tail and stop lamps are each 6-8 volt, 2 cp. All lamps have the single contact base.

FUSES.—The generator fuse is 5 amperes. Lighting fuse is 20 amperes.

Delco System

Plate No. 1044.

CASE

MODEL J. I. C. (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, Type SJRN-4; 6 volt, 127 ampere hour capacity. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file.

Oiling:—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Every 1000 miles put a small amount of medium heavy cup grease on the surface of the breaker cam and polish the distributor head with a soft clean cloth.

Timing:—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded. Locate the breaker cam carefully, so that when the backlash in the distributor gears is rocked forward the contacts will open, and when the backlash in the gears is rocked backward the contacts will just close. The distributor shaft rotates clockwise when viewed from the top.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M. taking 275 amperes at 4 volts.

Starter Data

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	4000	6	36
27 lb. ft.	Lock.	2.75	500

Starter brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

Oiling:—Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. Saturate the wick oiler in the Bendix gear case with light engine oil once each year. Every six months remove the grease plug and repack the reduction gear case with medium heavy cup grease.

GENERATOR:—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the charging rate, move the third brush in the direction of rotation (counter-clockwise) and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 15-17 amperes, reached at 1600-1800 R.P.M. of the armature or 22-27 miles per hour. The main brush tension should be 25-30 ounces and the third brush tension, 20-30 ounces.

Generator Test Data

Amperes	Volts	R.P.M.
0 (Cuts in)	7-7.5	650
4.5		800
13-17 (Max.)		1600
9-12		2300

Generator motoring freely takes a current of 4 amperes, at 6 volts, at armature speed of 450 R.P.M. The field draws a current of 3 amperes, at 5 volts.

Oiling:—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every two weeks.

RELAY:—Relay closes at approximately 8-9 M.P.H. or 650 R.P.M. of armature, and opens at approximately 550-600 R.P.M. of armature or 6-8 M.P.H., with a current discharge of 0-3 amperes. The contact gap separates .046-.062 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING:—Delco Combination Switch Model 1260. Head and stop lamps are 6-8 volt, 21 cp. S.C. Dash, tail and side lamps are 6-8 volt, 2 cp. S.C. Tonneau and dome lamps are 6-8 volt, 2 cp. D.C.

CIRCUIT BREAKER:—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current of 25-30 amperes, and will continue to operate with a current flow not exceeding 15 amperes.

BAY STATE

MODELS 1 AND 2 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 105 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. The breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil into distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 is at top dead center, on compression stroke, indicated on flywheel by marks "UD," spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, gaps are .027 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Cranking engine, starter takes 125-200 amperes at 5 volts.

Starter Test Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	4000	36	6
27	Lock	450.500	2.75

The pressure of the starter brushes on the commutator should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Saturate the wick in the oiler at the end of the Bendix gear case with light engine oil once each year. Every six months remove the plug in the reduction gear case and inject medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust charging rate, remove the cover band and shift the third brush mounting plate by means of an extension handle on the third brush. The plate is held in any position desired by means of friction clamp washers. The maximum charging rate is 16 amperes, reached at 1600 R.P.M.

Generator Test Data

Amperes	R.P.M.
4	800
8	1000
14-16 (Max.)	1600
15	2000

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-10 M.P.H. or at 6.75-7.5 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, and the air gap between the relay armature and coil core is .010-.015 inch, contacts fully closed.

LIGHTING:—Combination Switch Model No. 1246. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 2 cp. D. C. Dimmer, cowl and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current flow of 25-30 amperes, and will continue to function with a current flow of not more than 15 amperes.

Plate No. 1046

VELIE

MODEL 60 (1925) SERIAL NOS. 144100 UP.
WESTINGHOUSE GENERATING, STARTING, AND LIGHTING SYSTEM
WESTINGHOUSE IGNITION

BATTERY.—Willard, Type SJRN-3, 6 volts, 80 ampere-hour capacity. The starting capacity is 104 amperes for 20 minutes, and the lighting capacity is 5 amperes for 18 hours. The positive (+) terminal is grounded.

IGNITION.—Distributor Type JA. Coil Type SC. Breaker contacts separate .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. At the same time apply a small amount of vaseline on the interrupter cam.

Breaker.—Breaker contact begins to separate when piston No. 1 is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .025 inch.

STARTER.—Frame No. 711. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Cranks the engine at 125-145 R.P.M. taking a current of 125-150 amperes at 5.4 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
30-40	5.8	0	3500-6000
525	4	17 lb.-ft.	Lock

Oiling.—Put 5 or 6 drops of light engine oil into each of the starter oilers once a month. If the car is driven more than 1000 miles in a month this care must be given every 1000 miles.

GENERATOR.—Frame No. 36-DT. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the fibre plate in front of generator housing and loosen the brass nut, move the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and to decrease the same, move the third brush in the opposite direction (clockwise). The maximum charging rate is 12-14 amperes reached at 1250-1500 R.P.M. of the armature or 20 M.P.H.

Generator Test Data (Hot)

Amperes	R.P.M.
0	500-550
12-14	1250-1500

Generator motoring freely, takes a current of 5-7 amperes, at 6 volts. The field test draws a current of 2-4 amperes, at 6 volts.

OILING:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles.

RELAY:—Type 301,210B. Relay contacts close at 450 R.P.M. of the generator armature or 7 M.P.H. with a generator voltage of 7-7.5 volts and open at 400 R.P.M. of the armature at 6 M.P.H. with a discharge current of 0-2 amperes. Relay contacts separate .045 inch and the air gap between the relay armature and coil core is .005 inch, contacts closed.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. Dash, side and tail lamps are each 6-8 volt, 2 cp. All lamps are of the single contact type.

FUSES.—All fuses are 10 amperes. Generator field fuse is 5 amperes.

BEGGS
MODEL 20 (1925)
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
CONNECTICUT IGNITION

BATTERY:—Exide, Type 3-XC-13-1. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION.—Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, renew the inner breaker mechanism. For temporary service, resurface with fine emery cloth.

OILING.—Refill the cup under the breaker head with pure vaseline and turn down every month. If the car is driven more than 1000 miles in a month, this must be done every 1000 miles.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 5, 3, 6, 2, 4.

SPARK PLUG GAPS.—Spark plug gaps are .030 inch.

STARTER:—Model MH-1025. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter clockwise, looking at the commutator end.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6.	40-60
1.3 "	1500	5.5	100
5 "	800	5.	200
9 "	400	4.5	300
17.5 "	Lock	4.	600

OILING.—Put 5 or 6 drops of light engine oil in each of the starter oilers every month.

GENERATOR.—Model GJ. Generator current regulation is by the third brush system.

Generator Data.					
Cold Test. (25°C)			Hot Test (75°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
2	6.25	575	2	6.95	700
6	6.4	700	6	7.1	875
10	6.55	900	10	7.25	1200
14	6.7	1250	12	7.35	1650
15.5	6.8	1700	12	7.35	1850

Maximum charging rate is reached at 20-25 miles per hour or 1600-1700 R.P.M. of the armature.

OILING.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—Relay closes at 6-9 miles per hour or 550-600 R.P.M. of the armature and opens at 4-7 miles per hour or 500-550 R.P.M. of the armature. Charging current is 1-3 amperes at closing, and discharge current .5 to 1.5 amperes at opening of relay contacts. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove allgrit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are 3-4 volt, 2 cp.

BUICK STANDARD SIX (1925) DELCO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

BUICK
Standard Six (1925)
Delco System
Plate No. 1048

BATTERY:—Exide, Type 3-XC-13-1, 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2176. The distributor is mounted on the motor-generator. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The tension of the contact arm spring should be 13-16 ounces. The automatic advance starts at 580 R.P.M. and reaches a maximum of 14-18° at 1800 R. P. M. The total automatic and manual advance is 41°.

Oiling:—Put a small bit of medium heavy cup grease on the face of the breaker cam and wipe out the distributor head with a small amount of grease, removing all excess and polishing the rotor track with a soft clean cloth, every 1000 miles. See also motor-generator oiling.

Timing:—Breaker contacts begin to separate when Piston No. 1 entering power stroke reaches a position at which the 7 degree mark on the flywheel is opposite the mark on the flywheel housing. The 7 degree mark is approximately one inch past the dead center mark 1-6 on the flywheel.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .020-.025 inch.

STARTER:—Motor-generator Model 283. The starter is connected to the engine through a set of reduction gears and a mechanically operated pinion shift. Closing the ignition switch completes the generator circuit and allows the machine to motor, assisting the meshing of the pinion. An over-running clutch permits this rotation. When the starter pedal is depressed, it opens the generator circuit, meshes the starter pinion and completes the motor circuit allowing the machine to crank the engine. When the pedal is released, a spring reverses these operations. A second over-running clutch prevents the engine driving the motor-generator through the starter gears. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Running Free	6	70
6 " "	Lock	3	—

The brush pressure should be 5-6 pounds on the upper starter brush and 2 1/4 to 2 3/4 pounds on the lower brush.

GENERATOR:—Generator current regulation is by the third brush system. The average output required is 15 amperes. To adjust the charging rate remove the generator end cover and loosen the third brush plate adjusting screw one or two turns. Then shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the adjusting screw after making the adjustment.

Generator Data.

Amperes.	R.P.M.
6.5	825
20	1500

The pressure of the generator brushes on the commutator should be 1 3/4 pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in the bearing oiler at each end of the generator every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Give the Zerk connections on the distributor housing and the starter gear housing a charge of lubricant every 500 miles. Once each year disassemble, clean and repack the starter and generator clutches with vaseline.

RELAY:—No relay is used. The circuit between the battery and generator is controlled by the ignition switch. The over-running clutch allows the generator to operate as a motor when the voltage of the battery is higher than that of the generator. If the ignition switch is left in the 'on' position with the motor stopped, the noise made by the over-running clutch warns the operator to open the switch.

LIGHTING:—Combination switch No. 1234. Head lamps are each 6-8 volt, 21 cp. Dash dome, tonneau and tail lamps are each 6-8 volt, 3 cp. Side lamps are also 6-8 volt, 3 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

MODELS 24-6-41, 44, 45, 47, 48, 49, 50, 50L, 51, 54, 54C, 55, 57 (1925)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volt, 100 ampere-hour. The negative (—) terminal is grounded. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Ignition Coil No. 2176. Distributor is integral with motor-generator. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring is 13-16 ounces. The automatic advance starts at 580 R.P.M. and reaches a maximum of 16-20° at 1333 R.P.M. The total automatic and manual advance is 51°.

Oiling.—Apply a small amount of grease on the distributor track two or three times during the first 2000 miles. After this it will be necessary to keep the glazed surface wiped with a clean cloth. Apply a small amount of vaseline on the breaker cam each 1000 miles. See also starter-generator oiling.

Timing.—Breaker contacts begin to separate when the seven-degree mark on the fly-wheel (which is approximately one inch after top dead center) is at the indicator spark control lever and distributor drive shaft in the fully retarded position.

Firing Order.—The firing order is 1.4.2.6.3.5.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .020-.025 inch.

STARTER-GENERATOR.—Starter and generator are combined into one unit, but are electrically separate. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with ignition switch, a circuit is closed, allowing the current to flow through the generator windings, causing the armature to revolve slowly, aiding the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starting pedal meshes the reduction gears, opens the generator circuit, and allows the motor brush to come in contact with the commutator, closing the starter circuit and cranking the engine. When the pedal is released, a spring reverses these operations. Direction of rotation is counter-clockwise looking at commutator end. The pressure of the upper motor brush on the commutator should be 4 1/2 to 5 pounds and 2 1/4 to 2 3/4 pounds on the lower brush.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	75
8 "	Lock	3.1	—

GENERATOR.—Starter-Generator Model No. 268. The third brush system is employed for current regulation.

Generator Test Data

Amperes	R.P.M.	M.P.H.
0	600	7-8
8-9	825	—
Max. 14-16	1600	20-25
12-15	1800	—

To adjust charging rate, remove end cover and loosen the third brush adjusting screw one or two turns. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease it. After making the adjustment tighten the adjusting screw. Generator motoring freely with overrunning clutch takes a current of 5.5 amperes at 6 volts. Field current is 2.5 amperes. The pressure of the generator brushes on the commutator should be 1 1/2 to 1 3/4 pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on each end of the starter-generator armature shaft and an equal amount in the upper distributor shaft bearing oiler every 500 miles or each two weeks. Fill the Alemite connections on the distributor housing and starter gear housing with lubricant every 500 miles. The starter clutch should be cleaned and repacked with soft cup grease once each year.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch. The overrunning clutch at the driving end allows generator to operate as a motor when battery's pressure is above that of generator. If engine is killed when stopping, the noise made by the clutch serves to attract the operator's attention to open the ignition switch.

LAMPS.—Combination Switch Model No. 1252-1253. Head lamps are 6-8 volt, 21 cp. Dash, tail, dome, tonneau and side lamps are each 6-8 volt, 3 cp.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

Plate No. 1049

GARDNER **MODEL 6-A (1925)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM** **REMY IGNITION**

BATTERY:—Prest-O-Lite, Type 611-SHK. 6 volt, 92.5 ampere hour. The starting capacity is 110 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.5 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-P Distributor Model No. 626-P. Breaker contacts separate .019-.026 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. Manual advance is 15°. Automatic advance is 20°.

Oiling:—Screw up the grease cup on the side of the distributor housing one or two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam and oil the wick oiler under the rotor with light engine oil every 5000 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the flywheel reaches a position 10° or approximately one inch past the mark on the flywheel housing. The manual spark advance lever should be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 720-J. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush tension should be 20-28 ounces each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 " "	Lock.	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model No. 941-B. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system combined with a thermostat. The thermostat contacts open at approximately 160° inserting a resistance in the shunt field circuit and cutting down the output 50%. To adjust the generator output, loosen the screw on the generator end plate and shift the third brush mounting plate. Moving the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate of 18-20 amperes is reached at 1450 R.P.M. or approximately 25 M.P.H.

Generator Data.

REMY IGNITION.

BATTERY:—Prest-O-Lite, Type 617-RHK. 6 volt, 135 ampere hour. The starting capacity is 152 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-L. Distributor Model No. 648-A. Breaker contacts separate .018-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. Two sets of contacts used. They must be synchronized so as to open at the same instant. Manual advance is 20°. Automatic advance is 15°.

Oiling:—Screw up the grease cup on the side of the distributor housing one or two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Every 5000 miles place a small bit of vaseline on the face of the breaker cam and oil the wick oiler exposed when the rotor is removed with light engine oil.

Timing:—Breaker contacts begin to separate when the dead center mark for cylinders 1 and 8 on the flywheel is 10° or approximately one inch past the mark on the chain case cover. The ignition marking is on the front flywheel.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—The spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 720-J. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model No. 917-V. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at approximately 160° and reduce the generator output 50%. To adjust the charging rate loosen the screw on the generator end plate holding the third brush mounting plate and shift the third brush. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 19 amperes reached at 1900 R.P.M. of the generator armature or approximately 25 M. P. H.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.2	850	11	7.5	1900
19	8.4	1900			

The shunt field current is 5 amperes at 6 volts. The generator brush tension should be 22-28 ounces.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model 265-B. Relay contacts close at 675 R.P.M. of the armature with a generator voltage of 7.25 volts and open with a discharge current of 0-2.5 amperes. The charging current is approximately 3 amperes at closing of contacts. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Combination Switch Model 475-D. Head and stop lamps are each 6-8 volt, 21 cp.S.C. Dash, tail and side lamps are each 6-8 volt, 3 cp.S.C. Dome lamp is 6-8 volt, 4 cp.D.C.

FUSES:—Lighting fuses are 20 ampere.

NASH
SPECIAL SIX.
MODELS 131 TO 133 (1925)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM,
DELCO IGNITION

NASH
Special Six (1925)
Delco System.
Plate No. 1052

BATTERY:—U.S.L. Type 3-HVX-5X. 6 volt. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 5272. Breaker contacts separate .014 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The manual advance provided is 33°. Automatic advance begins at 580 R. P. M. and reaches a maximum of 20-24° at 1400 R.P.M. The tension of the breaker arm spring should be 13-16 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To time engine, loosen distributor cup clamp screw and turn distributor cup counter-clockwise until breaker contacts begin to separate. Make certain that rotor is under contact connected to cylinder which is ready to fire. Tighten the clamp screw after making the adjustment.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER:—Model No. 292. The starter is connected to the engine through a mechanical gear shift incorporated in the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
9.5 "	Lock	2.8	—

The starter brush tension should be 2 1/4 to 2 3/4 pounds each.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 291. Generator is belt driven and care must be exercised that the belt is not tight enough to cause undue wear on the bearings and yet not so loose that the generator armature will turn when the ignition switch is turned on. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by means of friction washers.

Generator Data.

Amperes.	R.P.M.
4	800
15	1600

The generator brush tension should be 1 1/4 to 1 3/4 pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearings oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—No relay is used. The generator is connected to the battery through the ignition switch. Opening the switch disconnects the generator and prevents the battery discharging.

LIGHTING:—Combination Switch No. 1264. Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 2 cp.S.C. Dash and tail lamps are each 6-8 volt, 2 cp.S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted on the back of the switch protects the lighting circuits. A current of 25-30 amperes will cause this device to vibrate. While operating the current is 10-15 amperes.

NASH
Advanced Six (1925)
Delco System
Plate No. 1053

NASH ADVANCED SIX MODELS 161 TO 169 (1925) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Gould, Type OSL-617. 6 volt, 117 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5263. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 35°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 20-24° at 1400 R.P.M. The tension of the breaker arm spring should be 13-16 ounces.

Oiling:—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft vaseline on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. To time engine, loosen advance lever clamp screw and shift distributor cup in a counter-clockwise direction until breaker contacts begin to separate. Tighten clamp screw after making the adjustment. Make certain that the rotor is under the contact connected to the cylinder which is ready to fire.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps:—The spark plug gaps are .025 to .030 inch.

STARTER:—Model No. 271. Starter is connected to the engine through a mechanical pinion shift incorporated in the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
11 "	Lock	2.7	—

The tension of the starter brushes should be 2¼ to 2¾ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model No. 269. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should be so loose that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Generator Data.

Amperes	R.P.M.
Neutral	650
4	800
8	1000
17-19	1500
8-12	2300

The charging rate is varied by loosening the generator cover band and shifting the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The brush tension on each of the generator brushes should be from 1¼ to 1¾ pounds.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearings every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LIGHTING:—Combination Switch No. 1267. Head lamps are each 6-8 volt, 21 cp.S.C. dome lamp is 6-8 volt, 4 cp.D.C. Side, dash and tail lamps are each 6-8 volt, 2 cp.S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker takes the place of fuses. A current of 25 amperes will cause this device to vibrate. While vibrating the current is 10-15 amperes.

CLEVELAND

MODEL 31 (1925)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 611-RHK. 6 volt, 80 ampere hour. The starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model No. T-6600. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Distributor oiling is automatic.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 955. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 110 R.P.M. taking 150 amperes at 6 volts. The brush tension of the starter brushes should be $1\frac{3}{4}$ to 2 pounds each. Starter switch in model S-203.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	45-60
2 "	1600	6	130
6 "	600	6	280
10 "	250	6	410
12 "	125	6	465
15 "	Lock	6	540

With a terminal voltage of 4 volts, the motor develops 12 lb. ft. lock torque, drawing, at a maximum, 450 amperes.

Oiling:—Starter is fitted with self-lubricating graphite bushings. They require no attention.

GENERATOR:—Models 1060-1069. Direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Charging rate is adjusted by shifting the third brush by means of an adjusting screw located on the end of the generator. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes reached at 1400-1800 R.P.M. on the model 1060 and at 1600-1800 R.P.M. on the model 1069 generator. This is approximately 19-21 M.P.H.

Generator Data.

Cold Test (20°C)			Hot Test (85°C)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6	520	0	6	520
7	7	800	4	6.6	800
13.6	7.7	1600	9.8	7.3	1600
11.6	7.4	2400	8.8	7	2400
8.3	6	3200	6	5.6	3200

Motoring freely the Model 1060 generator draws 5 amperes at 6 volts. The field current is 2.3 amperes at 6 volts. The model 1068 generator motors at 500 R.P.M. drawing 4-6 amperes at 6 volts. The field current is 3.2 amperes at 6 volts. The brush tension of all the brushes should be 1-1 $\frac{1}{4}$ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers each two weeks or every 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model I-1560. Relay contacts close at 800 R.P.M. of the armature or 9 M.P.H. when the generator voltage reaches 6.5-7.5 volts and open at 500 R.P.M. of the armature or 6 M.P.H. Charging current is 1-2 amperes at closing of contacts and discharge current 1-3 amperes at opening. Relay contacts separate .010 inch. Air gap between relay armature and coil core is .015 inch, contacts closed. Resistance of the shunt coil is 45 ohms.

LIGHTING:—Clum Combination Switch. Head lamps are each 6-8 volt, 21 cp.S.C. With dimmer resistance, head lamps are approximately 3 cp. The dash, dome, side, tonneau and tail lamps are each 6-8 volt, 3 cp.S.C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuse is 20 ampere.

CLEVELAND
Model 31 (1925)
American Bosch System

Plate No. 1054

DURANT MODEL A-22 (1925) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM. AUTO-LITE IGNITION.

BATTERY:—U. S. L. Type 3-HVX-5X, 6 volt 92 ampere hour. Starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.2 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model No. IG-4013. Distributor Model No. IG-4018-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil-stone.

OILING:—Put 4 or 5 drops of light engine oil in the distributor wick oiler every two weeks or each 250 miles.

TIMING:—Breaker contacts begin to separate when piston No. 1 on compression stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1-2-4-3.

SPARK PLUGS:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .027 inch.

STARTER:—Model MF-1096. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R. P. M. taking 115 amperes at 5 volts.

Starter Data.				
Torque	R. P. M.	Volts.	Amperes	
2 lb. ft.	1265	5	175	
5 "	735	5	305	
8 "	315	5	425	
10 "	Lock.	4	500	

The pressure of the starter brushes on the commutator should be from $1\frac{3}{4}$ to $2\frac{1}{2}$ pounds each.

OILING:—Self-oiling graphite bronze bearings are used. They require no attention.

GENERATOR:—Model GH-1036. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise) and in the opposite direction to decrease the charging rate. The maximum charging rate of 16 amperes is reached at 2400 R. P. M. of the generator armature or 31.5 M. P. H., car speed in high gear.

Cold Test (77°F.)			Generator Data.			Hot Test (230°F.)		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.

4	7.2	880	4	7.3	1050	4	7.3	1050
10	7.8	1320	10	7.6	1600	10	7.6	1600
16	8.3	2400	13.9	7.9	2560	13.9	7.9	2560
12.	8.0	3820	12.	7.8	3650	12.	7.8	3650

The pressure of the main brushes on the commutator should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each. The third brush pressure should also be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds.

OILING:—Put 4 or 5 drops of light engine oil in the oil cup on the commutator end of the generator every two weeks or each 500 miles. The drive end of the generator is oiled by the splash from the gears.

RELAY:—Model CB-1072. The relay closes at 675 R. P. M. of the generator when the voltage reaches 7 to 7.5 volts and opens with a discharge current of 0 to 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Nagel Combination Switch. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are 6-8 volt, 2 cp. D. C. and S. C. Side lamps (used on 1924 cars only) are 6-8 volt, 2 cp. S. C.

FUSES:—Lighting circuit fuse is 20 ampere. No generator fuse is used.

JORDAN
Models K and L (1924)
Delco Systems

Plate No. 1056

JORDAN

MODELS K AND L (1924)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard Type XR-15. 6 volt, 110 ampere hour. The starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model 5255. Breaker contact gap is .022 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a hard oilstone.

Oiling.—Place 8 or 10 drops of light engine oil in distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Repack distributor shaft housing with soft cup grease up to advance ring and yoke once each season.

Timing.—Breaker contact points begin to separate when No. 1 piston is $3\frac{5}{8}$ inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded; or 25° early, measured on the flywheel, with spark control lever and breaker fully advanced.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug gaps are .025-.030 inch.

STARTER.—Starter Model No. 208. The direction of rotation is clockwise, looking at commutator end. Starter cranks engine at 800 R.P.M. of motor armature, or 120 R.P.M. of engine, taking a current of 85 amperes (hot) or 105 amperes (cold). Lock torque is 27 pound-feet at 2.75 volts. Starter running free draws 36 amperes at 6 volts. The brush tension of the starter brushes should be from $2\frac{1}{2}$ to $2\frac{3}{4}$ pounds each.

Oiling.—Repack once or twice a season with soft cup grease by means of the grease plugs on the side of the gear housing. Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. The wick under the oiler on the outward bearing of the splined shaft should be saturated with light engine oil every 2000 miles. The starting motor must be withdrawn from the engine for this purpose.

GENERATOR.—Model No. 256. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush is used for current regulation. The maximum charging rate is 15 amperes, reached at 15 miles per hour.

Generator Test Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
5		700	6		700
11		1000	12		1000
14-16		1600	15-18		1600
15 Max.		1800	17 Max.		1800

Oiling.—Refill the two oil cups with light engine oil every two weeks. If the car is driven over 500 miles in two weeks, this care must be given every 500 miles. Avoid lubricating in such amount that the oil would eventually foul the generator commutator, and perhaps interfere with the proper amount of current generated.

RELAY.—Model No. 5754. Relay closes at approximately 8 miles per hour, and opens at approximately 5 miles per hour. The contact gap is .025-.035 inch. The air gap between the relay armature coil core is .025-.035 inch, contacts closed.

LIGHTING.—Delco Combination Switch No. 1243 is used. Head lights are 6-8 volts, 21 cp. Auxiliary lights are 6-8 volts, 4 cp. Dash and tail lights are 6-8 volts, 2 cp.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. The circuit breaker is mounted on the back of the switch. In operation, the circuit breaker intermittently cuts off the flow of current and produces an audible clicking sound, giving warning of an abnormal condition in one of the lighting circuits. This action will continue until the ground is removed or the switch operated to cut off the circuit on which the ground exists. In this manner the circuit breaker protects the wiring, switch and storage battery. Circuit breaker begins to operate with a current flow of 25 to 30 amperes, and will continue to operate with a current flow of not more than 15 amperes. Length of plunger which changes the maximum break between contacts is normally .012-.030 inch. Air gap, totally, between the disc and the walls of the U-shaped frame is .019-.025 inch.

PEERLESS

MODEL 67 (1925) SERIAL NOS. 329,501 UP.
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION.

BATTERY:—Exide, Type 3-XX-V-19-2. 6 volt, 135 ampere hour. The starting capacity is 146 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5250. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The tension of the breaker arm spring should be 13-16 ounces. Automatic advance begins at 500 R.P.M. and reaches a maximum of 14-18° at 1800 R. P. M. Total automatic and manual advance is 38°.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor head every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the surface of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15° before top dead center (measured on the flywheel) with the manual spark control lever in the fully advanced position, or on top dead center with the spark control lever in the fully retarded position.

Firing Order:—The firing order is 1R-1L-4R-4L-2L-3R-3L-2R.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .020-.025 inch.

STARTER:—Model No. 277. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush tension should be 2 1/4-2 3/4 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	—	6.	50
13	Lock	3.2	—

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, loosen the commutator cover band and shift the third brush arm mounting plate by means of the handle attached. Shifting the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any position desired by means of friction washers.

Generator Data.

Amperes.	R.P.M.
4	800
17	1600

The generator brush tension should be 1 1/4-1 3/4 pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0-3 amperes. Relay contacts separate .015 to .020 inch. Air gap between armature and coil core is .025 to .030 inch, contacts closed.

LIGHTING:—Combination Switch Model 1265. Head lamps and stop lamp are each 6-8 volt, 21 cp. Side and dome lamps are 6-8 volt, 4 cp. Tail and dash lamps are in series. They are each 3-4 volt, 2 cp.

CIRCUIT-BREAKER:—Model No. 5759. A vibrating circuit breaker is located in the lighting circuits. It requires a current of 25-30 amperes to start this device vibrating. While operating, the current is 10-15 amperes. A lock-out circuit breaker protects the horn, handy lamp, signal lamp and dome lamp circuits. A current of 25-30 amperes causes this device to open the circuit.

PEERLESS

MODEL 72 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

BATTERY: — Exide, Type 3-XX-15-1, Willard Type XR-15. 6 volt, 105 ampere hour. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5267. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oil stone.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of hard grease on the fiber bumper of the contact arm every month.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is 15° before top dead center (measured on the flywheel) as indicated by the mark on the flywheel and clutch housing, with the spark control lever and breaker assembly in the fully advanced position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are 7/8 inch. Gaps should be .025 inch.

STARTER: — Model No. 282. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Running free, the starter takes 60 amperes at 6 volts. Lock torque is 11 lb. ft. at 2.8 volts. The pressure of the starter brushes should be 2 1/4-2 3/4 pounds each.

OILING: — Oilless bearings are used. They require no attention.

GENERATOR: — Model No. 284. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes.	R. P. M.
5	700
18	1600

To adjust the generator output, remove the commutator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate, and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction washers. The pressure of the generator brushes on the commutator should be 1 3/4 pounds each.

OILING: — Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY: — Model No. 5754. Relay contacts close at 8 M. P. H. when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The contacts separate .030 inch. The air gap between the relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING: — Switch Model No. 1260. Head lamps are 6-8 volt, 21 cp. S. C. Signal lamp is 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Side, dash and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER: — A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

KISSEL **MODEL 75 (1925)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM.** **REMY IGNITION**

KISSEL
Model 75 (1925)
Remo System

Plate No. 1059

BATTERY:—Willard, Type SJR-4. 6 volt, 110 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-L. Distributor Model No. 648-B. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The breaker uses two sets of contacts. They must be synchronized so that they open at the same instant. To adjust, set stationary contact and then move mounting plate until the other contacts begin to open. The gap must be kept the same on both contacts.

Oiling:—Turn down the grease cup on the side of the distributor housing two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 10° past top dead center (measured on flywheel) with the spark is 15°. Manual advance is 20°. The tension of the contact arm spring should be 17-20 ounces.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER:—Model No. 720-J. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 145 R.P.M. taking 175 amperes at 5.0 volts.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500-5000	5.5	65
2 "	1750	5.0	145
15 "	Lock	3.1	575

The starter brush tension should be 24 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the end bracket of the starter every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model No. 917-V. The direction of rotation is counter-clockwise looking at the commutator end. Current regulation is by the third brush system and a thermostat located in the field circuit. To adjust the charging rate loosen the screw at the commutator end of the generator and shift the third brush. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 19 amperes reached at 1800 R.P.M. of the armature or 26 M.P.H. Thermostat contacts open at 175° and cut a resistance into the shunt field cutting down the output approximately 50%.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0.....	6.4.....	575			
7.....	7.1.....	850	9-11.....	7.8.....	1900
19.....	8.4.....	1900			

Motoring freely at 450 R.P.M. generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volt. Each coil, tested separately draws 10 amperes at 6 volts. The brush tension of each of the generator brushes should be 16-22 ounces.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model No. 265-B. Relay contacts close at 650 R.P.M. of the generator armature or 9 M.P.H. with a generator voltage of 7.0-7.5 volts and open at 500 R.P.M. or 7 M.P.H. with a discharge current of 0-1 ampere. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016-.020 inch, contacts closed.

LIGHTING:—Briggs & Stratton Switch, Model 2367, Type KEV. Head lamps are 6-8 volt, 21 cp.S.C. Dash, dome, stop and tail lamps are each 6-8 volt, 2 cp.S.C. Instrument lamp is 6-8 volt, 2 cp.D.C.

FUSES:—Lighting fuses are 20 ampere.

WILLS SAINTE CLAIRE

MODEL W-6 (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION

WILLS SAINTE CLAIRE.
Model W-6 (1925)
Delco System
Plate No. 1060

BATTERY:—Willard, Type SJR-5. 6 volt. The starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5280. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. No manual advance is provided. Automatic advance begins at 250 R.P.M. and reaches a maximum of 53-57° at 900 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease or vaseline on the face of the breaker cam and on the rotor track in the distributor head every 1000 miles. Polish the distributor head and remove all excess grease with a soft clean cloth.

Timing:—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position of 7° before top dead center (measured on the flywheel). In this position the mark "T"/SP on the flywheel will be opposite the mark on the flywheel housing. To set timing, loosen screw in center of breaker cam and rotate cam until the contacts begin to separate. Then tighten the screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are metric standard. Gaps are .025 inch.

STARTER:—Model No. 310. The starter is connected to the engine through a manual gear shift incorporated with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
13 "	Lock	3.2	—

The starter brush tension should be 2¼-2½ pounds each.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 311. The direction of rotation is counter-clockwise looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by means of friction washers.

Generator Data.

Amperes.	R.P.M.
4	800
13-15	1600

The generator brush tension should be 1¼ to 1¾ pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler at the commutator end of the generator every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. The bearing at the drive end of the generator is oiled by splash from the gear case.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0-3 amperes. Contacts separate .030 inch. Air gap between relay armature and coil core is .015 to .020 inch, contacts closed.

LIGHTING:—Combination Switch No. 1264. Head lamps are each 6-8 volts, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp. A dimmer switch is mounted on the steering column. It is Model No. 1286.

CIRCUIT-BREAKER:—A vibrating circuit-breaker mounted on the back of the switch protects the horn and lighting circuits. A current of 25-30 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

MOON

SERIES A (1925)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

IGNITION:—Coil Model No. 2182. Distributor Model No. 5274. Breaker contacts separate .014 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone, or with a fine, flat jeweler's file. Manual advance provided is 30°. Automatic advance begins at 550 R.P.M. and reaches a maximum of 18-24° at 2000 R. P. M. The tension of the breaker arm spring should be 13- 16 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles. Twice each year remove the grease plug on the side of the gear compartment and repack gears with medium heavy cup grease.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 286. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

		Starter Data.	
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 "	Lock	3.1	—

The starter brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 308. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by means of the third brush system in connection with a compensating field. Two field coils are connected between the third brush and the positive main brush. The other two coils are connected between the positive main brush and the negative main brush. To adjust the generator output, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers.

Generator Data.

Amperes.	R.P.M.
5	800
10-12	1600

The tension of the brushes should be $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds each.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and coil core is .015 to .020 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 2 cp.S.C.
Dash and tail lamps are each 6-8 volt, 2 cp. S.C.

SWITCHES:—Lighting switch is Model No. 1283. Ignition switch Model No. 1285. Starting switch is Model No. 1953.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted on the switch takes the place of fuses in the lighting circuits. A current of 25-30 amperes will start this device vibrating. While vibrating the current is 10-15 amperes.

CUNNINGHAM
Model V-4 (1925)
Delco System

Plate No. 1062

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. The negative (—) terminal is grounded. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5218. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The breaker arm spring tension should be 16-20 ounces. Manual advance is 25-30°. Automatic advance begins at 800 R.P.M. and reaches a maximum of 12½-14½° at 2100 R.P.M.

OILING.—Put 5 or 6 drops of light engine oil in the ignition unit oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Once each year remove the grease plug on the side of the distributor housing and repack the housing with medium heavy cup grease.

TIMING:—Breaker contacts begin to separate when the piston entering power stroke is 5 deg. past top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1R-1L-4R-4L-2L-3R-3L-2R.

Spark Plugs:—Spark plug gaps are ⅞ inch. Gaps are .030 inch.

STARTER.—Model No. 183. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to engine by a Bendix drive. Starter running free at 4000 R.P.M. takes a current of 60-70 amperes, 5.5 volts. Cranking the engine at 150 R.P.M. requires a current of 125-200 amperes, 5 volts. Lock torque is 24 lb. ft., current being 450-550 amperes at 2.75 volts. The starter brush tension should be 2¼ to 2¾ pounds each.

OILING:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR:—Model No. 285. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the output, loosen the locknut on the generator end plate and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Generator brush tension should be 1½-1¾ pounds each.

Generator Data

Amperes.	R.P.M.
4.....	800
18-20.....	1600

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-3 amperes. Relay contacts separate .015-.020 inch. Air gap between relay armature and coil core is .025-.035 inch, contacts closed.

LIGHTING:—Combination Switch Model 1281. Head, stop and backing lamps are each 6-8 volt, 21 cp.S.C. Dash and tail lamps are each 6-8 volt, 2 cp.S.C. Tonneau lamp is 6-8 volt, 2 cp.D.C. Dome lamp is 6-8 volt, 4 cp.D.C. Fender lamps are 6-8 volt, 4 cp.S.C.

CIRCUIT BREAKER:—A circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will start this device vibrating. While vibrating, the current is 10-15 amperes.

CHRYSLER

MODEL 25-F. SERIAL NOS. WW-100-W UP. REMY GENERATING, STARTING AND LIGHTING SYSTEM. REMY IGNITION

BATTERY:—Willard Type LWR-13. 6 volt, 93 ampere hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.5 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-P Distributor Model No. 634-A. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. Manual advance is 20°. Automatic advance is 18°. The tension of the contact arm spring should be 20 ounces.

Oiling:—Screw down the grease cup on the side of the distributor housing two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month. Put 4 or 5 drops of light engine oil in the oiler on the auxiliary bracket every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .060 inch before top dead center with the manual advance lever in the fully advanced position.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .027-.030 inch.

STARTER:—Model No. 712-D. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M. taking 150 amperes at 5 volts. Starting switch is Model 404-S.

Torque		R.P.M.		Volts		Amperes	
0 lb. ft.	5000	5	65				
11 "	Lock	3.6	450				

The starter brush tension should be 28-32 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The bearing on the drive end of the starter is of the oilless type.

GENERATOR:—Model No. 951-C. The direction of rotation is counter-clockwise, looking at the commutator end. The generator is belt driven, and care must be taken to see that the fan belt is not tight enough to crowd the generator bearings and yet should not permit the generator to slip. The third brush system is used for current regulation. To adjust generator output, loosen the hexagon-headed screw on the generator end plate and shift the third brush. Shifting the brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the output. The maximum charging rate is 15-17 amperes reached at 1800 R.P.M. of the armature or 20.4 M.P.H.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	750			
7	7.4	925	11.6	7.85	1978
16	8.3	1800			

Running freely as a motor, generator makes 440 R.P.M. drawing 6.5 amperes at 7.1 volts. Field current is 4-6 amperes at 6 volts. The tension of the generator brushes should be 18-24 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model No. 265-B. Relay closes at 750 R.P.M. when the generator voltage reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between the relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Switch Model 475-B. Head and stop lamps are each 6-8 volt, 21 cp. Dash, dome, side and tail lamps are each 6-8 volt, 3 cp.

FUSES:—Lighting fuse is 20 amperes.

Plate No. 1064

HUDSON

SUPER-SIX (1925)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 615-JFK. 6 volt, 100 ampere hour. The starting capacity is 120 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model T-6100. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. If excessively worn, points should be replaced.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil and place one drop of oil on the interrupter lever pivot every month or each 1000 miles if the car is driven more than 1000 miles in a month. Place a small bit of medium heavy cup grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the flywheel marking "A" is opposite the indicator on the flywheel housing with piston No. 1 on compression stroke and manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are metric. Gaps should be .025 inch.

STARTER:—Model No. 926. Starter is connected to the engine through a manual gear shift incorporating a set of reduction gears and an overrunning clutch. Pressing down on the starting pedal meshes the gears and closes the starting switch allowing the starter to crank the engine. When the pedal is released, a spring reverses these operations. The starter cranks the engine at 150 R.P.M. taking 125 to 200 amperes. Rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3800	5.75	70
3.6 "	1000	4	200
7 "	500	4.5	300
16.25 "	Lock	3.5	525

Oiling:—Starter is equipped with oilless bearings. They require no attention.

GENERATOR:—Model No. 1274. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, loosen the screws holding the inner commutator end plate upon which the third brush is mounted, and shift the brush. Shifting the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screws after making the adjustment.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
3	6.75	600	3	6.5	725
7	7.1	700	8	7.5	900
13	7.6	900	10	7.8	1000
17	8	1300	13	8	1350
13	8	1950	11	7.8	2000

Operating as a motor, the generator draws 6 amperes at 6 volts. The brush spring tension should be 1½ to 1¾ pounds each. The shunt field draws 6.6 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay is mounted on top of the generator. Contacts close when the voltage to 3 amperes. Relay contacts separate .015 inch. Air gap between the relay of the generator reaches 6.5 to 7.5 volts and open with a discharge current of 1 armature and coil core is .010 inch, contacts closed. The resistance of the shunt coil is 45 ohms.

LIGHTING:—Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 2 cp.S.C. Dash and tail lamps are connected in series. They are 3-4 volt, 2 cp. D.C. and S.C. respectively.

FUSES:—Generator field fuse is 7.5 amperes. Lighting fuse is 20 amperes. Two spare fuses are provided in a holder at the bottom of the switch.

ESSEX

MODEL 1925

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK. 6 volt, 85 ampere hour. The starting capacity is 102 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model T-6200. Breaker contacts separate .020 inch. They are made of tungsten. The contact surface of both points should be flat. When the condition of the contacts affects the ignition, resurface them with a fine flat jeweler's file. If the points are excessively worn they should be replaced.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil. Put one drop of oil (never more) on the interrupter lever pivot. Place a small bit of cup grease, about the size of a match head, on the side of the interrupter fibre block nearest the pivot post. These attentions should be given every 1000 miles or each month.

Timing:—Breaker contact points begin to separate when, with piston No. 1 on compression stroke, the mark on the flywheel is just opposite the indicator on the flywheel case. To adjust timing, turn engine until this position is reached. Then loosen the clamping nut on the stud just below the distributor and turn the housing in a counter-clockwise direction (opposite to direction of rotation) until the contacts begin to separate. Tighten the nut, being careful not to change the relative positions of the housing and shaft. The distributor is of the full automatic type. No manual advance is provided.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are metric standard. Gaps are .025 inch.

STARTER:—Type 948. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 1¾ to 2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3000	6	60
12	Lock	4	450

Note:—Starter model 948 has four brushes. For internal connections see motor diagram on preceding page.

Oiling:—Self-oiling bearings are used. They require no attention. Keep commutator clean and free from oil. Clean commutator by wiping it off with a clean cloth moistened with gasoline. Wipe dry before again using.

GENERATOR:—Type 1043. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 10 amperes (hot) at 8 volts, reached at 1600 R.P.M. of the generator.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	600
7	800	4	800
12	1200	8.5	1200
13.5	1600	10	1600
12.8	2000	9.5	2000
9	3000	6.5	3000

To adjust the charging rate, turn the adjusting screw on the outside of the commutator end plate. Turning the screw to the right increases the charging rate and to the left decreases the charging rate.

Oiling:—Put two or three drops of light engine oil in each of the generator oilers every 500 miles or each two weeks. See that commutator is clean and free from oil. Clean commutator by wiping it with a clean cloth moistened with gasoline. Wipe dry before again operating the generator.

RELAY:—No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Turning off the ignition disconnects the generator and prevents the battery from discharging.

LIGHTING:—Combination Switch Type S-116. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are connected in series. They are each 3-4 volt, 2 cp.

FUSES:—No generator fuse is used. Lighting fuse is mounted on the back of the switch and is 20 ampere. Two spare fuses are mounted at the bottom of the switch.

Model 1925
American Bosch System

Plate No. 1065

Plate No. 1066

ROLLS ROYCE

MODEL 40/50 (1925)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH BATTERY AND MAGNETO IGNITION.

BATTERY:—Exide. Type 3-XX-21-1. 6 volt. The starting capacity is 163 amperes for 20 minutes. The lighting capacity is 5 amperes for 30 hours. The positive (+) terminal is grounded at the starting motor.

IGNITION:—Two independent systems are used. Battery breaker contacts separate .014 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Magneto contacts separate .014 inch.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the distributor housing every week or each 500 miles if the car is driven more than 500 miles in a week. Put several drops of light engine oil in each of the magneto oilers and on the battery ignition distributor, remove the distributor cap, rotor and contact breaker cup and apply a few drops of engine oil to the joints and sliding sleeve of the advance mechanism. This must be done every month or each 2000 miles if the car is driven more than 2000 miles in a month.

Timing:—Battery breaker contacts begin to separate when the piston entering power stroke reaches a position 10° after top dead center (measured on flywheel) with the breaker assembly in the fully retarded position. Magneto breaker contacts begin to separate when the piston entering power stroke is 6° before top dead center (measured on the flywheel) with the breaker assembly in the fully retarded position. These points are indicated by flywheel markings.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are metric. Gaps are .028 inch.

STARTER:—Frame No. 778 Style S-382435-A. Starter is connected to the engine through a system of epicyclic gears and chain to the transmission. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 70 R.P.M. Lock torque is 31 lb. ft. starter drawing 800 amperes at 4 volts. The pressure of the starter brushes should be 2½ to 3 pounds each.

Oiling:—Fill the starter bearing oilers with light engine oil and also fill the oilers on the epicyclic gear casing at either end of the starter driving chain every month or each 2000 miles if the car is driven more than 2000 miles in a month. Put a few drops of heavy oil on the starter driving chain.

GENERATOR:—Frame No. 77-R, Style S-382436 and 57-IR, Style S-416699. Generator is chain driven from the transmission case. The direction of rotation is counter-clockwise, looking at the commutator end. Generator regulation is by a constant voltage relay-regulator. This causes the charging rate to vary with the condition of the battery giving a high rate when charging a discharged battery and tapering off as the battery becomes charged. The maximum charging rate is reached at 1200 R.P.M. or 20 M.P.H. Charging rate is adjusted by increasing or decreasing the regulator voltage by turning the regulator adjusting screw.

Generator Data.

Frame 77-R.			Frame 57-IR		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	—	475	0	—	400
5	—	575	8	—	525
20	6.5	1200	15	6.5	1200

Operating freely as a motor these machines draw 5 amperes. The field current is 1.5 amperes on the Frame 77-R and 1.4 amperes on the Frame 57-IR.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers and put a few drops on the generator belt links every month or each 2000 miles if the car is driven more than 2000 miles in a month.

RELAY:—Relay contacts close at 600 R.P.M. of the generator armature at 10-11 M.P.H. and open at 500 R.P.M. or 9 M.P.H. with a discharge current of 0-1 ampere.

LIGHTING:—Westinghouse Switch. Head lamps and stop lamp are each 6-8 volt, 21 cp. Dash, dome, tail, side and tonneau lamps are each 6-8 volt, 2 cp.

FUSES:—All fuses are 10 ampere.

STUDEBAKER

MODEL ER (1925) STANDARD SIX.

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM.

WAGNER IGNITION.

STUDEBAKER
Standard Six (1925)
Wagner system

Plate No. 1067

BATTERY:—Willard, Type SJRR-3. 6 volt, 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model K-789. Distributor Model K-815. The breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling:—Put 4 or 5 drops of light engine oil in each of the oilers on the side of the distributor housing. Lift the spring arm on top of the breaker arm pivot and put 2 or 3 drops of light engine oil on the felt wick exposed. Remove the rotor and put several drops of oil in the oiler in the center of the breaker cam. These attentions must be given every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the mark on the flywheel "UP-DC" 1-6" is opposite the pointer on the right side of the flywheel housing, with the breaker or assembly in the fully retarded position. To set timing, loosen screw in center of breaker cam and shift cam until the contacts begin to separate. Then tighten the screw. Provision is made for accurate setting by loosening the screw on the breaker plate and rotating the plate. A graduated scale is provided to gauge the setting. Tighten the screw after making the adjustment.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. S-533. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush pressure should be 1000 grams each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.85	65
16 "	Lock	3.2	530

Oiling:—Put 4 or 5 drops of light engine oil in the bearing oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model No. S-509. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The third brush mounting plate is held in position by a screw in the generator end plate. To adjust the charging rate, shift the third brush in the direction of generator rotation to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum output is 15 amperes reached at 1500 R.P.M. of the generator armature.

Generator Data.

Amperes	Volts	R.P.M.
0	7.2	580
10	7.75	1000
15	8.1	1500
8.5	7.68	3000

Operating freely as a motor, generator makes 300 R.P.M. taking 5 amperes at 6 volts. The brush pressure should be 550 grams each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model No. K-44. Relay contacts close at 580 R. P. M. with a generator voltage of 7.2 volts and open with a discharge current of 0-4 amperes. The contacts separate .035 inch. The air gap between the relay armature and coil core is .025 inch, contacts closed.

LIGHTING:—Lighting Switch Model 420-A. Head lamps are 6-8 volt, 21 cp.S.C. Dash, and tail lamps are 6-8 volt, 3 cp.S.C. Dome, stop, side and corner lamps are 6-8 volt, 4 cp.S.C.

FUSES:—Fuses are 10 ampere.

STUDEBAKER
Big and Special Sixes (1925)
Wagner System

Plate No. 1068

BATTERY:—Willard, Type SJRR-4. 6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. K-789. Distributor Model No. K-814. Breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling:—Fill the oilers on the side of the distributor housing with light engine oil. Remove the rotor and put several drops of oil in the oil hole in the center of the breaker cam. Lift the spring arm on the breaker arm pivot and put 2 or 3 drops of oil on the wick oiler exposed. This oiling must be done every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the flywheel marking "UP-DC-1-6" is opposite the indicator on the left side of the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the screw in the center of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to separate. Then tighten the screw. For close setting, loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. S-503. Starter is mounted at front of the engine and is connected to the crankshaft through a sprocket and chain. An over-running clutch is provided to prevent the engine driving the starter. The direction of rotation is clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1000	5.8	67
75 "	Lock	3.2	530

The starter brush pressure should be 1000 grams each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once every three months lubricate the starter clutch with light engine oil applying through the oiler provided. Remove the grease plug in the reduction gear case and repack the gears with graphite grease once each year.

GENERATOR:—Model No. S-508. The direction of rotation is counter-clockwise, looking at the commutator end. The generator is mounted vertically at the forward end of the engine. Current regulation is by the third brush system. The third brush mounting plate is held in position by a screw in the generator end plate. To increase the charging rate, move the third brush in the direction of generator rotation and in the opposite direction to decrease the charging rate.

Generator Data.

Amperes	Volts	R.P.M.
0	7.2	580
10	7.25	1000
16	8.1	1500
8.5	7.65	3000

Operating freely as a motor, generator makes 300 R.P.M. taking 5 amperes at 6 volts. The brush pressure should be 550 grams each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model K-44. Relay contacts close at 580 R.P.M. with a generator voltage of 7.2 volts and open with a discharge current of 0.4 amperes. Contacts separate .035 inch. The air gap between the relay armature and coil core is .025 inch, contacts closed.

LIGHTING:—Lighting Switch Model 420-B. Head lamps are 6-8 volt, 21 cp.S.C. Tail and dash lamps are 6-8 volt, 3 cp.S.C. Tonneau, stop, side and dome lamps are each 6-8 volt, 4 cp.S.C.

FUSES:—Fuses are 10 ampere.

HUPMOBILE

MODEL R-14 (1925) SERIAL NOS. R-160397 UP. WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM WESTINGHOUSE IGNITION

BATTERY:—Willard Type, CRR-15. 6 volt, 105 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model Nos. 288,761C and 395,271. Distributor Model No. 395,209. The breaker contacts separate .013-.015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The surface of the contacts must be parallel. The ignition current is approximately 3 amperes.

Oiling:—Place 4 or 5 drops of light engine oil in the oil cup and apply a small amount of vaseline to the cam with a toothpick once to every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given to every 500 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the fly-wheel is 2 inches past the indicator, spark control lever and breaker assembly midway between the fully retarded and fully advanced positions.

Firing Order:—The firing order is 1, 2, 4, 3.

Spark Plug Gaps:—Spark plug gaps are .020 to .022 inch.

STARTER:—Frame No. 33A.B. Style 298,808. The direction of rotation is counter-clockwise, looking at the commutator end. Running free the starter armature revolves at 3700-4100 R.P.M., taking 70 amperes at 5.5 volts. The torque at 1600 R.P.M. is 1.75 pound-feet, the current being 150 amperes at 5.5 volts. The lock torque is 12 pound-feet at 4 volts, the current being 500 amperes. The pressure of the brushes on the commutator is 1 to 1½ pounds.

Oiling:—Put 5 or 6 drops of light engine oil in each of the starter bearing oilers every month.

GENERATOR:—Frame No. 36-DT. Generator current regulation is by the third brush system. The maximum charging rate is 10-12 amperes (generator hot), reached at 1250 R.P.M. of the armature or 20-25 miles per hour. The direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
0	450		0	500	
8	675		6	725	
15-17	1250		10-12	1250	
12	840		9	850	
10	2000		7-8	2000	

The cold test readings are obtained with a generator temperature under 95°F. The hot test readings are obtained after generator has been operated one hour at 1800 R.P.M., charging a half-charged battery. Shunt field current is 2.8 to 3.25 amperes at 6.0 to 6.6 volts. Operating as a motor the generator takes 5.0 amperes at 6.0 to 6.3 volts.

Oiling:—Put 5 or 6 drops of light engine oil in the commutator end bearing oiler every two weeks. If the car is driven more than 500 miles in two weeks the oiling must be done every 500 miles.

RELAY:—Style No. 301210B. Relay closes at 10 M. P. H. or 500 R. P. M. of armature or at 6.5 volts, and opens when there is a discharge of from 0-3 amperes. The contacts separate .030-.035 inch. The air gap between armature of relay and coil core is .005 inch, contacts closed. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS:—Head lamps are 6-8 volt, 21 cp.S.C. Dash, tail, side and dome lamps are each 6-8 volt, 3 cp.S.C.

FUSES:—Lighting circuit fuses are 10 ampere. Generator field fuse is 5 ampere.

HUPMOBILE

MODEL E-1 (1925) SERIAL NOS. E-1 UP.

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM AT WATER KENT IGNITION.

BATTERY:—Willard, Type SJR-6. 6 volt, 155 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model N. Distributor Model RA. Breaker contacts separate .010-.012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam, applying with a toothpick, every 1000 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the flywheel is 8° past the indicator on the flywheel housing with the spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1-5-2-3-8-4-7-6.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch Gaps are .022-.025 inch.

STARTER:—Frame No. 59A0. Type S-416662. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft. _____	2500-3500 _____	5.5 _____	45 _____
34 " _____	Lock _____	3.5 _____	675 _____

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Frame No. 36-GT. Type S-416706. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate shift the third brush. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate.

Generator Data.

Amperes	Volts	R.P.M.
0	—	500
8	—	800
16-17	8	1400-1450
10	8	2500

Running freely as a motor, generator draws 5 amperes at 6.2 volts. Shunt field current is 2.35 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. Contacts separate .030 to .035 inch. The air gap between the relay armature and coil core is .015 inch, contacts closed.

LIGHTING:—Head lamps and stop lamp are each 6-8 volt, 21 cp.S.C. Dash, dome, tail and side lamps are each 6-8 volt, 3 cp.S.C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuses are 20 ampere.

FRANKLIN

SERIES 11 (1925)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.

ATWATER KENT IGNITION.

BATTERY:—Willard, Type XR-19. 6 volt, 135 ampere hour. The starting capacity is 146 amperes for 20 minutes. The negative (—) terminal is grounded

IGNITION:—Coil Model N-7, Distributor Model RA. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil on the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month. Also place a small bit of vaseline on the face of the interrupter cam, applying with a toothpick.

Timing:—Breaker contacts begin to separate when Piston No. 1 entering power stroke is $\frac{3}{4}$ inch before top dead center (measured on the flywheel) when the mark 1-6 on the clutch is $\frac{3}{4}$ inch before top dead center with the spark control lever and breaker assembly in the fully retarded position. At this point the triangular mark on the fanwheel will be to the right of or before the center line on the fan wheel housing.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .031 inch.

STARTER:—Model DH. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes.
0 lb. ft.	2300	5.8	80
2 "	1100	5.44	140
3.5 "	980	5.3	185
6 "	610	4.9	256
23.2 "	Lock	3.4	590

Oiling:—Starter bearings are of the oilless type. They require no attention. Refill the oiler on the Bendix gear case with the pressure gun every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model CE. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system operating in conjunction with a compensating shunt field. Two shunt fields are used each being wound on two field poles. The light shunt field is connected between one main brush and the third brush; the battery being connected to these same brushes. The heavy shunt field is connected between the third brush and the other main brush. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0.....	6.6.....	410			
9.8.....	7.3.....	600			
14.....	8.....	1000	12.....	8.....	800
11.4.....	8.2.....	2000			
9.8.....	8.....	3200			

To adjust the generator output, loosen the screw in the center of the knurled nut on the generator end plate and turn the nut clockwise to increase the charging rate and counter-clockwise to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this condition. Two brushes must be raised.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay contacts close at 410 R.P.M. of the armature when the voltage of the generator reaches 6.5 volts and open at 370 R.P.M. with a discharge current of 0-2 amperes. Contacts separate .025 to .040 inch. Air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Lighting Switch, Connecticut Model 194-Y. Head lamps and stop lamp are 6-8 volt, 21 cp.S.C. Dimmer lamps are 6-8 volt, 4 cp.S.C. Dome lamp is 6-8 volt, 4 cp.S.C. Dash and tail lamps are each 6-8 volt, 2 cp.S.C.

FUSES:—Lighting fuses are 20 ampere.

STAR

MODEL F (1925)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type CDN-311, 6 volt, 84 ampere-hours capacity. Starting capacity—96 amperes for 20 minutes. Lighting capacity—5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model IG-4041. Distributor Model IG-4030-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone. The condenser is now mounted in the distributor housing.

Oiling.—Fill grease cup under the breaker head with soft cup grease and turn down once every two weeks. Put 4 or 5 drops of light engine oil on the wick oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

Timing.—Breaker contacts begin to separate when No. 1 piston is at top dead center, on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark plugs: — Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 to .027 inch.

STARTER:—Model MG-4004. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2300	5.5	100

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given to every 500 miles.

RELAY.—Relay closes at 500-550 R.P.M. of armature, or 7-9 M.P.H., and opens at 450-500 R.P.M., 5-7 miles per hour. Relay contact gap separates .025-.035 inch. Air gap between relay armature and coil separates .010-.015 inch.

LIGHTING.—Head lights are 6-8 volts, 21 cp., S.C. Dimmer and tail lights are 6-8 volts, 4 cp., S.C. Dash light, 6-8 volts, 2 cp., S.C.

FUSES.—20 amperes.

OAKLAND

MODEL 6-54 (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM.

REMY IGNITION.

BATTERY: — Prest-O-Lite, Type 613-RHN, 6 volt, 100 ampere hours. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. 284-L. Distributor Model No. 616-G. Breaker contacts separate .020 to .028 inch. They are made of tungsten. When the condition of the points affected the ignition, resurface with a fine contact file.

OILING: — Refill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Remove the rotor and saturate the wick in the oiler on the distributor shaft with light engine oil every 1000 miles or each month. Place a small amount of vaseline on the face of the breaker cam, applying with a toothpick.

TIMING: — Breaker contacts begin to separate 5° before top dead center. The spark control is of the fully automatic type, no manual advance being provided. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. Then mount the distributor so that with the indicator pointing to the center of the scale (0 position) the breaker contacts are just beginning to separate. Then rotate the housing 5°, or one half of one division on the clamp scale, in a counter-clockwise direction (opposite to direction of rotation). When this position is reached, clamp the distributor in the mounting.

FIRING ORDER: — The firing order is 1,5,3,6,2,4.

SPARK PLUG GAPS: — The spark plug gaps are .025 to .030 inch.

STARTER: — Model No. 713-B. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is clockwise, looking at the commutator end.

OAKLAND
Model 6-54 (1925)
Remy System.

Plate No. 1073

Starter Test Data.

Torque.	R. P. M.	Volts.	Amperes.
0	5000	65	5.
12	Lock	475	3.6

The tension of the starter brushes should be from 20 to 28 ounces each. The starting switch model is 406-A.

OILING: — Put 5 or 6 drops of light engine oil in the oiler at the commutator end of the motor every 1000 miles or each month. At the same time fill the connection on the drive end by means of a pressure oil gun.

GENERATOR: — Model Nos. 917-K & 917-S. Generator current regulation is by means of the third brush system. A thermostat located in the field circuit of the generator inserts a resistance in the shunt field at a temperature of 195°-200°F, which reduces the charging rate by approximately one half. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18-20 amperes at 8.3-8.5 volts reached at 1900 R. P. M. of the generator.

Generator Test Data.

Hot Test.			Cold Test.		
Amperes	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
			0		675
			7	7-7.3	850
9-12	8-8.5	1900	18-20	8.3-8.5	1900

To adjust the generator output, loosen the screw exposed in the commutator end plate and shift the third brush mounting plate. Move the third brush in the direction of armature rotation (counter-clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The field draws 4 to 5.9 amperes at 6 volts. The brush tension should be 14-18 ounces on 917-K generator and 22-24 ounces on the 917-S model.

OILING: — Put 5 or 6 drops of light engine oil in the oiler at the commutator end of the generator every 1000 miles or each month.

RELAY: — Model 265-A and 265-B. The relay is mounted on top of the generator. Relay contacts close at 675 R. P. M. of the generator with a voltage of 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes on the model 265-A and 0 to 2.5 amperes on the model 265-B relay. Relay contacts separate .010 to .016 inch on the model 265-A and .015 to .025 inch on the model 265-B. Clean relay contacts by drawing unglazed paper between them. If they are badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit and adjust before again putting into service.

LAMPS: — Combination Switch Model Nos. 481-A and 481-B. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are each 6-8 volt, 2 cp.

McFARLAN SINGLE VALVE SIX (1925) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM. WESTINGHOUSE IGNITION.

BATTERY:—Willard Type SJR-4. .6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model 288,761-C. Distributor Model 382,528. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the distributor housing every 2000 miles and put a small bit of vaseline on the face of the breaker cam applying with a toothpick.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Frame 711. Style 355708. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The brush tension should be $2\frac{1}{2}$ -3 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500-6000	5.5	35-45
2.5 "	1250	5.5	—
17 "	Lock	4.	500-575

Oiling:—Put 4 or 5 drops of light engine oil in the starter oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Frame 56-AT. Style 395399. The direction of rotation is clockwise looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output loosen the nut on the generator end plate and shift the third brush. Shifting the brush in the direction of rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Data.

Cold Test (35°C)			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	500			
8	7.5	750	10-12	8.	1100-1600
15-17	8.	1100-1600	7-11	7.5	2500
7-12	7.	2500			

Motoring freely, generator draws 5-7 amperes at 6 volts. The shunt field current is 2.5-3 amperes at 6.5 volts.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay contacts close at 500 R.P.M. of the generator armature when the voltage reaches 6.5 volts and open at 400 R.P.M. with a discharge current of 0-3 amperes. Contacts separate .030-.035 inch. Air gap between relay armature and coil core is .015-.025 inch, contacts closed.

LIGHTING:—Clum Switch, Model 10429. Head lamps are 6-8 volt, 21 cp.S.C. Side and tail lamps are each 6-8 volt, 4 cp.S.C. Dash lamp is 6-8 volt, 2 cp.D.C

FUSES:—Lighting fuses are 20 ampere.

McFARLAN
Twin Valve Six (1922-23-24-25)
Westinghouse and Splitdorf Ignition.

Plate No. 1075

McFARLAN **TWIN VALVE SIX (1922-23-24-25)** **WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM** **WESTINGHOUSE AND SPLITDORF IGNITION.**

BATTERY:—Willard, Type SJR-6. 6 volt, 155 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Westinghouse. Coil Model 331296-A. Distributor Model DN. Type 366,190. Breaker contacts separate .012 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the distributor housing every 2000 miles. Also place a small bit of vaseline on the face of the cam applying with a toothpick.

IGNITION:—Splitdorf. Type SS-6-2. Breaker contacts separate .020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or with well worn No. 00 sandpaper.

Oiling:—Put 3 or 4 drops of light engine oil in the magneto bearing oilers every 1000 miles.

Timing:—Battery breaker contacts begin to separate when the piston entering power stroke reaches a position 1/2 inch before top dead center (measured on the flywheel) and magneto breaker contacts begin to separate when the piston reaches top dead center. In both cases the breaker assembly and spark control lever should be in the fully retarded position. The timing can be checked by the position of the flywheel marking in regard to the mark on the flywheel housing.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Frame 778, Style 290371-A. Starter is connected to the engine through a magnetically shifted pinion. The direction of rotation is counter-clockwise, looking at the commutator end. Brush pressure should be 2 1/2-3 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
5 lb. ft.	1140	5.5	235
31 "	Lock	4	800

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Frame 781-IR. Style 293842. The direction of rotation is clockwise looking at the commutator end. Generator regulation is by a vibrating relay regulator. The voltage remains constant and the charging rate depends upon the condition of the battery. Maximum charging rate is 20 amperes reached at 1200 R.P.M. of the armature. To increase the charging rate loosen the regulator contact spring by turning the thumb screw and increase the the spring tension to decrease the charging rate.

Generator Data

Amperes	Volts	R.P.M.
0	6.5	425
20	6.5	1200

Operating freely as a motor, generator draws 5 amperes at 6-6.3 volts. Shunt field current is 1.25-1.75 amperes at 6-6.3 volts. Brush pressure should be 1 1/4 to 1 1/2 pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY REGULATOR:Type FC. Relay contacts close when the voltage of the generator reaches 6.5 volts at approximately 425-500 R.P.M. and open with a discharge current of 1-2 amperes. Contacts separate .012 inch. Air gap between relay armature and coil core is .055-.060 inch, contacts closed. Regular contacts separate .045-.055 inch. Air gap is .015-.019 inch.

LIGHTING:—Clum Switch Type 10160. Head lamps are 6-8 volt, 21 cp.S.C. Side and tail lamps are each 6-8 volt, 4 cp.S.C. Dash lamp is 6-8 volt, 2 cp.D.C.

FUSES:—Lighting fuses are 30 amperes.

Note:—Generator 781-IR is a four pole machine using only two brushes. Starter 778 has no resistance units in parallel with the field.

Plate No. 1076

COLE

MODEL 890 (1925)

NORTHWAY M-309 AND M-311 ENGINES

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 140 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resur-medium hard oilstone.

face with fine emery cloth or against the flat side of an emery wheel, finishing on a
Oiling.—Put 8 or 10 drops of light engine oil into the distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a small amount of vaseline to the rotor track occasionally during the first 2000 miles. After this, it is only necessary to keep the rotor track wiped clean with a clean cloth moistened with gasoline. Be sure to wipe it dry before placing rotor track into operation. Repack distributor with medium soft cup grease up to the advance ring and yoke once each season.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is 1½ inches before top dead center, measured on flywheel, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72 (M-309 engine), 259 (M-311 engine). The starter is connected to the engine by a Bendix drive. The direction of rotation is clockwise, looking at commutator end. Starter cranks the engine at 125 R.P.M., taking 40 amperes. The brush spring tension should be 2¼-2¾ pounds each.

Starter Test Data.

Torque	R.P.M.	Amperes	Volts
0 (Running free).....	4500.....	40.....	6.0
17.5 lb. ft.....	0 (Lock).....	450-500.....	3.5

Oiling.—Oilless bearings are used. They require no attention. On the Model 259 starting motor saturate the wick in the oiler on the Bendix gear end of the motor with light engine oil once each year.

GENERATOR:—Model No. 153. The direction of rotation is counter-clockwise looking at commutator end. The generator begins to supply current at 7 miles per hour or 500 R. P. M. of armature and reaches its maximum current out-put of 14-16 amperes at 1400 R.P.M. of the armature or 18-25 M.P.H., car speed in high gear. Generator brush tension should be 1¼-1¾ pounds each.

Generator Test Data

Amperes	R. P. M.
Neutral	500
10-12	900
14-16 (Max)	1400
11-13	2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be reseated after adjusting position.

Oiling:—Put 5 or 6 drops of light engine oil into each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

RELAY.—There is no relay. The circuit between the generator and battery is controlled by the ignition switch.

LIGHTING.—Combination Switch Model No. 1154 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary lights are each 6-8 volts, 4 cp. Dash, dome, corner, and tail lights are each 6-8 volts, 4 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start this device vibrating. While vibrating, the current is 3-5 amperes.

MODEL 93 (1925)

AUTO-LITE IGNITION.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse is 20 amperes.

WILLYS KNIGHT

MODEL 66 (1925)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM

DEJON IGNITION

BATTERY:—U.S.L. Type 3-HVX-8X. 6 volt. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 33.2 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CA-4010. Distributor Model IA-4010. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. Automatic advance begins at 150 R.P.M. of the distributor and reaches a maximum of 15° at 1500 R.P.M. Ignition current is 5 amperes with the resistance unit cold which decreases to 4-4.25 amperes within 30 seconds.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles if the car is driven more than 250 miles in a week. Keep the grease cup on the distributor shaft filled with pure vaseline and turn down one turn every week.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° before top dead center (measured on the flywheel) with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model SB-4008. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.	40
1.2 "	2200	5.5	100
4.1 "	1150	5.	200
7.3 "	760	4.5	300
10.5 "	500	4.	400
28.4 "	Lock	4.	930

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model DB-4003. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, insert a screwdriver in the slotted end of the third brush shifting shaft which is located on the generator end plate above the bearing retainer and turn the shaft in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 16 amperes at 8 volts reached at 1600 R.P.M. of the generator armature or 20 M.P.H. Shunt field current is 2.5 amperes at 6 volts.

Generator Data

Cold Amperes	R.P.M.	Hot Amperes
0	500	0
2.75	600	1.5
10.5	1000	8.5
15.5	1600	13.0
11.75	2400	11.0
9.5	3600	8.75

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model RA-4001-A. Relay contacts close at 480-510 R.P.M. with a generator voltage of 7-7.5 volts and open with a discharge current of 0-2 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Head and stop lamps are each 6-8 volt, 21 cp.S.C. Side, tail, dash and dome lamps are each 6-8 volt, 3 cp.S.C.

Switch:—Lighting switch is Briggs and Stratton Model No. 38360.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

Plate No. 1079

LEXINGTON

CONCORD AND MINUTE MAN SIXES (1924-25) AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION.

BATTERY:—(Concord) Willard, Type XW-15. (Minute Man) Willard, Type SJR-4. 6 volt, 105 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model 225-Y. Breaker contacts separate .012-.015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling:—Refill the cup under the distributor head with vaseline and turn down every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position at which the top dead center mark on the flywheel is two teeth after top dead center on the Concord model and when the exhaust closing mark on the flywheel is opposite the indicator on the Minute Man model. The spark control lever and breaker assembly should be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .020 inch.

STARTER:—Model 942. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $1\frac{3}{4}$ -2 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	50
9 ..	350	4	—

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model 1051. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate turn the small screw located on the commutator end plate. Turning the screw in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes reached at 1500-1600 R.P.M. of the generator armature.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	425	0	6.4	500
7	6.8	800	4	6.5	800
12	7.5	1200	8.4	7	1200
13.5	7.7	1600	9.8	7.2	1700
11.5	7.5	2400	8.6	7	2400

The brush spring tension should be $1\frac{3}{4}$ -2 $\frac{3}{4}$ pounds each. Motoring freely, generator draws 6 amperes at 6 volts. Shunt field current is 2.3 amperes at 6 volts.

Oiling:—Put 3 or 4 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.5-7.5 volts and open with a discharge current of 0-2 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Connecticut Switch. (Concord) Model 198-1-Y. (Minute Man) Model 186-2-Y. Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 3 cp.S.C. Dome lamps are 6-8 volt, 4 cp.S.C. Dash lamps are 6-8 volt, 2 cp.D.C. Tail lamps are 6-8 volt, 3 cp.S.C. on the Concord model and 4 cp.S.C. on the Minute Man models.

FUSES:—Generator field fuse is 5 ampere. Lighting fuses are 15 ampere.

REO

MODEL T-6 SERIES E AND G (LATE 1925) NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH-EAST IGNITION

REO
Model T-6, Series E & G (1925)
North-East Generating, Starting and Lighting System
North-East Ignition

Plate No. 1080

BATTERY:—Willard, Type SJR-4. 6 volt. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 10481. Distributor Model T Type 10695. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Never use emery cloth.

Oiling.—The distributor cap and rotor arm should be kept clean and dry. They ordinarily need no lubrication, because the carbon contacts are self-lubricating. Make sure that the carbon brush is free in its socket, also that the flat spring carrying the center contact is bent up sufficiently to make good contact with the distributor cap.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke, mark "Spark" on flywheel is even with the top edge of right hand engine support, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER:—Model R, Type 3581-A. Starter is connected to the engine through a ratchet and chain on a universal shaft. If the starter mechanism ever fails to engage or takes hold with a thump or pound when the starter button is depressed, it is an indication that there is not enough tension on the friction cable. On the other hand if the pawl is not brought entirely out of engagement when the starter button is released, there is too much friction on the friction cable. To adjust the tension slack off or draw up on the nut which holds the end of the rod. The starter cranks the engine at 100 R.P.M. with a current of 95-110 amperes. Lock torque is 50 lb. ft., with a current of 470 amperes.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. The reduction gear case is filled with No. 4 Keystone grease and requires very infrequent renewal.

GENERATOR:—Model MAT, Type 6089-L-6. (With Ignition). The direction of rotation is counter-clockwise, looking at driving end. The third brush system is used for current regulation. To adjust the charging rate, loosen lock screws on the commutator end housing. Turning the adjusting screw in the clockwise direction increases the charging rate, and turning to the counter-clockwise direction decreases the charging rate. Be sure to tighten the lock screw in order that the adjustment of generator output is locked in position desired. The maximum charging rate is 18-19 amperes reached at 1350-1500 R. P. M. of the generator armature.

Generator Test Data			
Amperes (Cold)	Volts	R.P.M.	Amperes (Hot)
17.....	6.5.....	1250.....	15.6
18.....	7.0.....	1320.....	16.3
19.....	7.5.....	1440.....	17.0
20.....	8.0.....	1600.....	17.6
21.....	8.5.....		18.2

Oiling.—Put 4 or 5 drops of light engine oil into each generator oiler and oiler under distributor head every two weeks. If the car is driven more than 500 miles in two weeks, this oiling must be done every 500 miles. The gear case is packed with No. 4 Keystone grease and should be refilled each year.

RELAY:—Type 11,690-A. The relay closes at 525 R. P. M. of the armature or 10-12 M.P.H. at 6.5-7.5 volts, and opens at 425-500 R.P.M. of armature or 8-10 M.P.H., with a current discharge of 0-2 amperes. The contact gap is .025-.040 inch, contacts fully separated. The air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lights are each 6-8 volts, 21 cp. Dash, dimmer and tail lights are each 6-8 volts, 2 cp. Trouble light is 6-8 volts, 2 cp. All the above lights are of the single contact type.

FUSES.—Generator fuse is 6 amperes, and the lighting fuses are 5 amperes each.

A J A X

1925-26

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L. Type 3-HVX-5X, 6 volt. The negative (—) terminal is grounded. The starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.4 hours. The battery is 7 7/16 by 9 3/4 by 9 1/8 inches.

IGNITION.—Coil Model 1G-4061. Distributor Model 1G-4110. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file. The surface of the contacts should be flat and parallel. The distributor is of the full automatic type. Automatic advance begins at 200 R.P.M. of the distributor and reaches a maximum of 15° (distributor) at 1200 R.P.M. This is equivalent to a flywheel advance of 30°.

Oiling.—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks. Put one drop of light engine oil on the breaker arm hinge and place a small amount of vaseline on the face of the breaker cam every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plug.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model MP-4101. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 185 R.P.M., taking 140 amperes at 4.8 volts. The starter brush tension should be 1 1/2-1 3/4 pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5.5	75
1 lb. ft.	2800	5.25	150
2 lb. ft.	2000	5.0	200
4 lb. ft.	1250	4.5	300
5 lb. ft.	1000	4.2	350
12 lb. ft.	Lock	3.	650

Oiling.—Put 4 or 5 drops of light engine oil in oiler on the drive end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The commutator end bearing is of the self-lubricating type and requires no attention.

GENERATOR.—Model GTB-4004. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, remove the commutator band and loosen the nut under the third brush holder. Then shift the third brush in the direction of generator rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the nut after making the adjustment. The maximum output of 14 amperes is reached at 1700 R.P.M. of the armature or 22 M.P.H.

FORD
Model T (1926)
Ford-Liberty System

Plate No. 1082

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

FORD MODEL T (1926) LIBERTY GENERATING, STARTING AND LIGHTING SYSTEM FORD IGNITION

BATTERY.—Ford or U. S. L. Type 3-HVX-5X, 6 volt. The starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.4 hours. The negative (—) terminal is grounded.

IGNITION.—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magneto delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Oiling.—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of ¼ kerosene and ¾ light engine oil should be used.

Timing.—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer housing in the fully retarded position.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 160 amperes at 5 volts.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Oiling.—Starter requires no oiling.

GENERATOR.—Type F.A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer and tail lamps are 6-8 volt, 2 cp.

Plate No. 1083

BREWSTER

MODEL 02 (1926)

U. S. L. GENERATING, STARTING AND LIGHTING SYSTEM BERLING IGNITION

BATTERY:—Exide. Type 6-XX-13-1. 12 volt, 90 ampere hour. The starting capacity is 185 amperes for 20 minutes. The negative (—) terminal is grounded.

IGNITION:—Model ZR-4. Breaker contacts separate .016-.020 inch. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or worn No. 00 sandpaper.

OILING.—Put 10 drops of light engine oil in each of the magneto oil cups every month. Put a small amount of vaseline on the cam and on the rubbing surfaces of the fiber lever, applying with a toothpick. If the car is driven more than 1000 miles in a month, these attentions must be given every 1000 miles.

TIMING:—Breaker contacts begin to separate when piston entering power stroke is 5 millimeters before top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER.—The firing order is 1, 3, 4, 2.

SPARK PLUGS:—Spark plugs are $\frac{7}{8}$ inch in diameter. Gaps should be .020 inch.

STARTER-GENERATOR.—Model E-207. Armature is fastened to the engine crankshaft, taking the place of the flywheel. When operating as a starter, the unit cranks the engine at 175 R.P.M., taking 185 amperes.

GENERATOR.—Generator current regulation is by third brush and compensating field. Maximum current output is 12 amperes at 500 R.P.M. of the armature or 18 miles per hour. Pressure of brushes on the commutator is $1\frac{3}{4}$ pounds.

OILING.—Starter-generator requires no oiling.

RELAY.—Relay closes at 11 miles per hour or 350 R.P.M. of the armature, and opens at 9 miles per hour or 250 R.P.M. of the armature. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volt, 36 cp. Dimmer lamps are 12-16 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp.

FUSES:—Lighting fuses are 20 ampere. Large fuse in relay box is 30 ampere. Small field fuse is 6 ampere capacity.

Plate No. 1084

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

COLE

MASTER MODEL (1926) NORTHWAY M-309 AND M-311 ENGINES DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJRN-5, 140 ampere-hour. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium, hard oilstone. The tension of the contact arm spring should be 16-20 ounces. Automatic advance begins at 600 R.P.M. and reaches a maximum of 14° at 1600 R.P.M. The manual advance is 22°.

Mounting.—Distributor is mounted on a bracket at the rear of the generator, but is driven through a vertical shaft by a pinion and worm on the cam shaft. To remove distributor, loosen the manual advance stop screw and lift the unit from its place.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oilers every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Apply a small amount of vaseline to the rotor track occasionally during the first 2000 miles. After this, it is only necessary to keep the rotor track wiped clean with a clean cloth moistened with gasoline. Be sure to wipe it dry before placing rotor track into operation. Repack distributor with medium soft cup grease up to the advance ring and yoke once each season.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke is 1½ inches before top dead center, measured on flywheel, spark control lever and breaker assembly in the fully advanced position.

Firing Order.—The firing order is 1R, 4L, 3R, 2L, 4R, 1L, 2R, 3L.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER.—Model No. 72 (M-309 engine), 259 (M-311 engine). The starter is connected to the engine by a Bendix drive. The direction of rotation is clockwise, looking at commutator end. Starter cranks the engine at 125 R.P.M., taking 40 amperes. The brush spring tension should be 2¼-2¾ pounds each.

Starter Test Data.			
Torque	R.P.M.	Amperes	Volts
0 (Running free).....	4500.....	40.....	6.0.....
17.5 lb. ft.....	0 (Lock).....	450-500.....	3.5.....

Mounting.—Starter is mounted at the right of the transmission case behind the flywheel. To remove, remove the large pilot screw and four hold-down screws and lift starter from its position.

Oiling.—Oilless bearings are used. They require no attention. On the Model 259 starting motor saturate the wick in the oiler on the Bendix gear end of the motor with light engine oil once each year.

GENERATOR.—Model No. 153. The direction of rotation is counter-clockwise looking at commutator end. The generator begins to supply current at 7 miles per hour or 500 R. P. M. of armature and reaches its maximum current out-put of 14-16 amperes at 1400 R.P.M. of the armature or 18-25 M.P.H., car speed in high gear. Generator brush tension should be 1¼-1¾ pounds each.

Generator Test Data	
Amperes	R. P. M.
Neutral	500
10-12	900
14-16 (Max)	1400
11-13	2000

To increase the charging rate loosen the two screws holding third brush arm, and move third brush in a counter-clockwise direction (looking at commutator end). To decrease charging rate, move third brush in a clockwise direction. Brush must be reseat after adjusting position.

Continued on reverse side

CLEVELAND
Model 31 (1926)
American Bosch System

Plate No. 1085

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

CLEVELAND

MODEL 31 (1926)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 611-RHK. 6 volt, 80 ampere hour. The starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model No. T-6600. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Distributor oiling is automatic.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 955. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 110 R.P.M. taking 150 amperes at 6 volts. The brush tension of the starter brushes should be $1\frac{3}{4}$ to 2 pounds each. Starter switch in model S-203.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	45-60
2 "	1600	6	130
6 "	600	6	280
10 "	250	6	410
12 "	125	6	465
15 "	Lock	6	540

With a terminal voltage of 4 volts, the motor develops 12 lb ft. lock torque, drawing, at a maximum, 450 amperes.

Oiling:—Starter is fitted with self-lubricating graphite bushings. They require no attention.

GENERATOR:—Model 1069. The direction of generator rotation is counter-clockwise look at the commutator end. Generator current regulation is by the third brush system. Charging rate is adjusted by shifting the third brush by means of an adjusting screw located on the end of the generator. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes reached ing at 1600-1800 R.P.M. of the generator armature or 19-21 M.P.H.

Generator Data.

Cold Test (20°C)			Hot Test (85°C)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6	520	0	6	520
7	7	800	4	6.6	800
13.6	7.7	1600	9.8	7.3	1600
11.6	7.4	2400	8.8	7	2400
8.3	6	3200	6	5.6	3200

Motoring freely the generator draws 4-6 amperes at 6 volts while revolving at 500 R.P.M. The shunt field current is 3.2 amperes at 6 volts. The brush tension should be $1\frac{1}{4}$ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers each two weeks or every 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model I-1560. Relay contacts close at 800 R.P.M. of the armature or 9 M.P.H. when the generator voltage reaches 6.5-7.5 volts and open at 500 R.P.M. of the armature or 6 M.P.H. Charging current is 1-2 amperes at closing of contacts and discharge current 1-3 amperes at opening. Relay contacts separate .010 inch. Air gap between relay armature and coil core is .015 inch, contacts closed. Resistance of the shunt coil is 45 ohms.

LIGHTING:—Clum Combination Switch. Head lamps are each 6-8 volt, 21 cp.S.C. With dimmer resistance, head lamps are approximately 3 cp. The dash, dome, side, tonneau and tail lamps are each 6-8 volt, 3 cp.S.C.

FUSES:—Generator field fuse is 5 ampere. Lighting fuse is 20 ampere.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

CLEVELAND

MODEL 43 (1926)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM

AMERICAN BOSCH IGNITION

BATTERY.—Prest-O-Lite, Type 611-RHK. 6 volt, 80 ampere hour. The starting capacity is 95 amperes for 20 minutes. The lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-6230. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Distributor oiling is from the chassis lubricating system.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 943. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks engine at 110 R.P.M. taking 150 amperes at 6 volts.

Starter Data.

Torque	R.P.M.	Volts	Amperes.
0 lb. ft.	4000	6	45-50
2 "	1500	-	130
6 "	600	-	280
10 "	250	-	410
12 "	125	-	465
15 "	Lock.	6	540

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 1052. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Shift the third brush by means of the adjusting screw on the outside of the generator. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13 to 14 amperes reached at 1500-1600 R. P. M. of the generator armature or 21.8 M.P.H.

Generator Data.

Cold Test (20°C)			Hot Test (85°C)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.	520	0	6.	520
7	7.0	800	4	6.6	800
13.6	7.7	1600	9.8	7.3	1600
11.6	7.4	2400	8.8	7.0	2400
8.3	6.0	3200	6.0	5.6	3200

Motoring freely at 500 R.P.M. the generator draws 4 amperes at 6 volts. The shunt field current is 2-3 amperes at 6 volts. Brush pressure should be $\frac{1}{4}$ to $\frac{2}{4}$ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks this oiling should be done every 500 miles.

RELAY:—Relay is mounted on top of the generator. Relay contacts close at 800 R.P.M. or 11 M.P.H. when the generator voltage reaches 6.5 to 7.5 volts and open at 500 R.P.M. or 7 M.P.H. with a discharge current of 0 to 2 amperes. Charging current at closing of contacts is approximately 0 to 2 amperes. Contacts separate .012 to .014 inch. Air gap between relay armature and coil core is .018 inch.

LIGHTING:—Clum Switch Model 20. Head lamps are 6-8 volts, 21 cp. Dash, tail, tonneau, dome and side lamps are 6-8 volt, 3 cp. With dimming resistance, head lamps are approximately 3 cp.

FUSES:—Generator field fuse is 5 ampere. Lighting fuse is 20 ampere.

DODGE

1926

NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM DODGE-NORTH-EAST IGNITION

BATTERY.—Willard, Type SJR-26, also Exide, 12 volt, 51.4 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Type 10,205. Distributor Model O, Type 10,004. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the points affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel, finishing on a hard oilstone.

Oiling.—Force grease into distributor by means of a grease nipple, using a pressure feed grease gun once every month or 2000 miles.

Timing.—Breaker contacts begin to separate when the exhaust valve in cylinder No. 4 just closes, spark control lever and breaker assembly in the fully retarded position. This is the firing position for No. 1 cylinder.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plug Gaps.—Spark plug gaps are .030 inch.

STARTER-GENERATOR.—Model GA, Type 3804-A. The direction of rotation is counter-clockwise, looking at the commutator end. Starter and generator are combined into one unit. The unit is chain-connected to the engine crank shaft. Adjust chain so as permit 1/2 inch up-and-down play midway between the sprockets.

Starter Data.

Torque	R.P.M.	Amperes
6 lb. ft.	460	49
10 lb. ft.	350	78
13 lb. ft.	295	95
16 lb. ft.	233	116
35 lb. ft.	Lock	225

GENERATOR.—Generator current regulation is by reverse series field and third brush system. Rotation is counter-clockwise, viewed from commutator end.

Generator Data

Amperes	Hot Test	R.P.M.	Amperes	Cold Test	R.P.M.
0.0	1000	0.0	900		
5.0	1200	5.5	1100		
7.0	1200	8.0	1200		
8.0	1800	9.0	1800		
6.0	3400	7.0	3800		

Charging rate is varied by adjusting the third brush. The position of the brush is adjustable by a rack and pinion movement, operated by turning a screw, exposed in commutator end plate. The adjusting screw is the upper one. It is necessary to first loosen the lower screw one or two turns, in order to unlock the third brush plate. Turn the upper screw in a clockwise direction (looking at commutator end) to increase the charging rate, and in counter-clockwise direction to decrease the charging rate. Tighten the lower screw after making the adjustment. Maximum current output must not exceed 10 amperes. Main and third brush tension is 1-1/4 pounds.

Oiling.—Put 4 or 5 drops of light engine oil in rear bearing oiler of starter-generator every 2000 miles.

RELAY.—Relay is mounted with the starting switch. Relay closes at 10 miles per hour, or 1050 R.P.M. of armature, and opens at 8 1/2 miles per hour, or 900 R.P.M. of armature. Relay contacts separate .030 inch. Clean relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well-worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 12-16 volts, 21 cp. Dash and tail lamps are each 12-10 volts, 2 cp. Dome lamp is 12-16 volts, 4 cp. All lamps have single contact base.

FUSES.—Field fuse, mounted on generator frame, is 10 amperes.

DELCO SYSTEM

Plate No. 1088

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

BATTERY.—Exide, Type 3-LXRV-15-2G. 6 volt, 130 ampere hour. The starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2189. Distributor Model 5281. Breaker contacts separate .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The tension of the contact arm spring should be 16-20 ounces. Manual advance is 18-22°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 30° at 2800 R.P.M.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Mounting.—Distributor is mounted between the cylinder banks and is driven by spiral gears from the cam shaft. To remove unit, remove hold down screw and lift from position.

Timing.—One set of breaker contacts begins to separate when piston No. 1 on compression stroke reaches a position at which the flywheel marking IG/A-1/5 is opposite the indicator on the flywheel case. This is approximately 1 21/32 inches before top dead center. The manual advance lever must be in the fully advanced position. The other set of contacts open when the engine has turned over 90° (or 45° of the distributor). In this position the flywheel marking IG/A-2/6 is opposite the indicator.

Firing Order.—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model No. 314. Starter is connected to the engine through a pinion shift incorporated in the starting pedal. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 104 R.P.M. taking 140-150 amperes. Starter brush tension should be 2 1/4-2 1/2 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6.	60
11 lb. ft.	Lock	3.2	

Mounting.—Starter is mounted vertically at the rear of the engine. To remove, loosen set screw in steering column and remove starting pedal button and accelerator pedal. Then remove toe boards and disconnect hand throttle rod and foot throttle rod. Remove three hold down screws and lift starter from place.

Oiling.—Self-lubricating bearings are used. They require no attention.

GENERATOR.—Model No. 315. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, shift the third brush mounting plate by turning the hexagonal nut on the outside of the generator end plate. Turning the nut in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum output is 15-17 amperes reached at 1000 R.P.M. of the generator armature.

CHANDLER

MODEL 32-A (1926)

**AMERICAN BOSCH GENERATING, STARTING, AND LIGHTING SYSTEM
AMERICAN BOSCH IGNITION**

BATTERY.—Prest-O-Lite, Type 613-RHN, 6 volts, 100 ampere-hour capacity. The starting capacity is 105 amperes for 20 minutes, and the lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model FI-635. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contacts affect the ignition, remove and resurface on a medium hard oilstone. If excessively worn, replace the points.

Oiling.—Fill oiler on the side of the distributor housing with light engine oil. Put one drop of light engine oil (less rather than more) on the interrupter lever pivot. Place a bit of hard grease about the size of a match head on the side of the interrupter fibre block nearest to the pivot post. The above lubricating instructions must be followed every month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position one-half tooth past top dead measured on the flywheel with the spark control lever in the fully advanced position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inches, and the gaps are .020 inch.

STARTER.—Model No. 959. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-150 R.P.M. taking 150 amperes at 5-5.5 volts. The brush tension should be 13½-2 pounds each. Starter switch is Model S-203.

Starter Test Data

Starter Test Data			
Torque	R.P.M.	Amperes	Volts
0.....	4000.....	35-40.....	6.....
12 lb. ft.....	Lock.....	450.....	3-4.....

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 1070. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for generator current regulation. To adjust the charging rate, insert special wrench in the hole on the generator end plate or remove cover band and shift third brush mounting plate by hand. Shifting the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the rate. The maximum generator output is 13-14 amperes at 7.5 volts, which is reached at 1600-1800 R.P.M. of the armature. When making the adjustment, generator frame temperature should be 50-80° F. and the battery fully charged. Brush tension should be 1-1¼ pounds each. Motoring freely generator draws 6 amperes at 6 volts. The shunt field current is 3.2 amperes at 6 volts.

Generator Test Data

Generator Test Data			Cold Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.0	600	0	6.3	520
4	6.0	800	7	6.9	800
8.6	7.0	1200	12	7.4	1200
9.8	7.3	1600	13.7	7.6	1600
9.6	7.3	2000	12.8	7.6	2000
8.8	7.0	2400	11.5	7.4	2400
6.0	5.6	3200	8.4	6.0	3200

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 500 R.P.M. of armature or 6-8 M.P.H. or at 6.5-7 volts, and opens at 450 R.P.M. of armature or 5-6 M.P.H. with a current discharge of 0.2 amperes. The contact gap separates .015 inch, and the air gap between relay armature and coil core is .010 inch, contacts fully closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp. A dimmer resistance on the switch cuts a resistance into the head lamp circuit for dimming. Dash, tail, side and tonneau lamps are each 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 amperes. All other fuses are 20 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

LINCOLN

1926

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Exide Type 3-LXR-15-2. 6 volt, 130 ampere hour. The starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2159. Distributor Model 5226. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. A manual advance of 18-23° is provided. Automatic advance begins at 900 R.P.M. and reaches a maximum of 24-28° at 2000 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Oiling.—Put 3 or 4 drops of light engine oil in the oiler on the side of the distributor housing every 250 miles. Remove the grease plug and pack the gear case with light cup grease to a level just below the cover plate (located on the front of the unit near the spark control lever) every 5,000 miles. Place a small amount of vaseline or heavy grease on the face of the breaker cam and in the distributor head every 1,000 miles. Remove all excess and polish the rotor track with a soft clean cloth.

Mounting.—Distributor is mounted at the forward end of the engine. To remove, remove four hold down screws and lift distributor upward and out from position.

Timing.—Right hand breaker contacts begin to separate when piston No. 1R on compression stroke reaches a position at which the vertical mark preceding the marking "RET" on the clutch ring is opposite the indicator with the spark control lever in the fully retarded position. This breaker controls the right hand coil and fires 4 cylinders. The left hand breaker controls the other coil and fires the remaining cylinders. The engine fires at intervals of 60° and 120° corresponding to 30° and 60° of distributor travel. These intervals must be accurately located. It may be done by connecting a test lamp in each circuit and noting the exact instant the contacts separate. Small marks may be scratched on the edge of the housing opposite the rotor when the contacts separate. These should measure 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Firing Order.—The firing order is 1R-4L-2R-3L-4R-1L-3R-2L.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER-GENERATOR.—Model 193. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Depressing the starter pedal meshes the gears, opens the generator circuit and brings the starter brushes in contact with the commutator, allowing it to crank the engine. When the pedal is released, a spring reverses these operations. Two overrunning clutches permit the high speed necessary in cranking the engine and prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the starter commutator end; starter brush tension should be 2 1/4-2 3/4 pounds.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0	4000	6	60
10	Lock	3	

GENERATOR.—Generator current regulation is by the third brush system. To adjust charging rate, loosen cover band on the generator end (front) of unit, exposing the brush regulating lever. Raising the lever increases the charging rate; lowering it decreases the charging rate. Replace the cover band after adjusting. A thermostat mounted with third brush opens at 195-200° F. cutting down the output 30%. The brush tension should be 1 1/2-1 3/4 pounds each.

Generator Data.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

MOON SERIES A (1926) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—U.S.L. Type XY-13. 6 volt. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 5274. Breaker contacts separate .014 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone, or with a fine, flat jeweler's file. Manual advance provided is 30°. Automatic advance begins at 550 R.P.M. and reaches a maximum of 18-24° at 2000 R. P. M. The tension of the breaker arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted on generator at right of engine. To remove, remove manual advance lever stop screw and lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles. Twice each year remove the grease plug on the side of the gear compartment and repack gears with medium heavy cup grease.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 286. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 "	Lock	3.1	—

The starter brush tension should be 2 1/4 to 2 3/4 pounds each.

Mounting.—Starter is mounted at the right of the engine. To remove, remove three flange screws holding starter in position. Then pull unit forward and out.

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 308. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by means of the third brush system in connection with a compensating field. Two field coils are connected between the third brush and the positive main brush. The other two coils are connected between the positive main brush and the negative main brush. To adjust the generator output, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers.

Generator Data.	
Amperes.	R.P.M.
5	800
10-12	1600

The tension of the brushes should be 1 1/4 to 1 1/2 pounds each.

Mounting.—Generator is mounted at the right of the engine and is chain driven from the crankshaft. To remove generator, disconnect pump shaft coupling. Then remove round plate on front side of chain case and nut holding sprocket on generator shaft. Loosen clamp adjustment screw and remove two flange mounting screws. Then slide generator to rear and lift out.

Continued on reverse side

MOON

LONDON MODEL (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 100 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Mounting.—To remove distributor, remove manual advance lever stop screw and lift unit from position.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Place a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "UD" on flywheel opposite indicator in flywheel housing, spark control lever and breaker assembly in the fully retarded position. To set timing, loosen advance lever clamp screw and turn housing in a counter-clockwise direction until the contacts begin to separate. See that rotor is under contact which is connected to cylinder No. 1. Tighten clamp screw after making adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are $\frac{7}{8}$ inch, and the gaps are .030 inch.

STARTER.—Model No. 181. The starter is connected by a Bendix drive to the engine. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., and takes a current of 125-200 amperes at 5 volts.

Starter Test Data			
Amperes	Volts	Torque	R.P.M.
40-50.....	5.5.....	Running Free.....	4500
450-550.....	2.75.....	27 lb. ft.....	Lock

Mounting.—Starter is mounted at right of engine in a sleeve mounting. To remove starter, remove large hold-down screw and pull starter forward from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every 1000 miles or each month. Saturate the wick in the oiler on the Bendix gear case once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice a year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band on the commutator end of generator housing, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (clockwise) of rotation. The third brush plate is held in any position by means of a friction clamp. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature.

Generator Test Data	
Amperes	R.P.M.
5	700
11	1000
14-16 (Max.)	1600
15	2000

Mounting.—Generator is mounted at left of engine. To remove generator, remove hold-down screws, disconnect coupling and lift unit from position.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

PREMIER

MODEL 4-B TAXICAB (1925-26)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM. AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 611-KPC. 6 volt, 137.5 ampere hour. The starting capacity is 100 amperes for 20 minutes. The lighting capacity is 5 amperes for 27.5 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-4234. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file.

OILING:—Fill the oiler on the side of the distributor housing with light engine oil once each month or each 1000 miles. Put one drop of oil on the interrupter lever pivot pin and place a small bit of grease on the fiber bumper of the interrupter lever at the same time.

TIMING:—The breaker contacts begin to separate when the piston entering power stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1-3-4-2.

SPARK PLUGS:—The spark plug diameters are $\frac{7}{8}$ inch. The gaps are .028 inch.

STARTER:—Model No. 959. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R. P. M.	Volts.	Amperes.
Free	4000	6	50 to 60
1.2 lb. ft.	1900	5.5	100
3.7	1000	5.0	200
6.5	550	4.5	300
10.0	200	4.0	400
12.5	Lock.	3.5	490

The pressure of each of the starter brushes on the commutator should be 2 pounds.

Mounting.—Starter is mounted at the right side of the engine. Mounting is by a standard S. A. E. No. 2 flange.

OILING:—The starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model No. 1229. The direction of rotation is counter-clockwise, the commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes reached at 1200 to 1300 R. P. M. of the generator armature.

Generator Data.

Cold Test.			Hot Test.		
Amperes	Volts	R. P. M.	Amperes	Volts	R. P. M.
0	6.5	550	0	6.5	650
8	7.5	780	8	7.5	850
16-18	8.0	1300	12-13	8.0	1400
8-10	7.8	3000	7-9	7.5	3000

To adjust the charging rate shift the third brush. Shifting the brush in the direction of generator rotation (counter-clockwise) increases the output and in the opposite direction, decreases the charging rate. Motoring freely the generator takes 6 amperes at 6 volts. The shunt field current is 6.5 amperes at 6 volts. The pressure of the main brushes on the commutator should be 1.5 pounds. The third brush pressure should be 1.25 pounds.

Mounting.—Generator is mounted on the right side of the engine by a standard S. A. E. No. 2 flange mounting.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

CUNNINGHAM

MODEL V-6 (1925-26)

AFTER 1ST HUNDRED CARS IN 1925

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. The negative (—) terminal is grounded. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours.

IGNITION.—Coil Model No. 2177. Distributor Model No. 5218. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The breaker arm spring tension should be 16-20 ounces. Manual advance is 25-30°. Automatic advance begins at 800 R.P.M. and reaches a maximum of 12½-14½° at 2100 R.P.M.

Mounting.—Distributor is mounted at the forward end of the engine between the cylinder banks. To remove, disconnect manual advance rod and remove two hold-down screws. Then lift distributor from position.

OILING.—Put 5 or 6 drops of light engine oil in the ignition unit oiler every two weeks. If the track of the rotor button in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Once each year remove the grease plug on the side of the distributor housing and repack the housing with medium heavy cup grease.

TIMING.—Breaker contacts begin to separate when the piston entering power stroke is 5 deg. past top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is IR-IL-4R-4L-2L-3R-3L-2R.

Spark Plugs.—Spark plug gaps are 7/8 inch. Gaps are .030 inch.

STARTER.—Model No. 183. The direction of rotation is counter-clockwise, looking at commutator end. The starter is connected to engine by a Bendix drive. Starter running free at 4000 R.P.M. takes a current of 60-70 amperes, 5.5 volts. Cranking the engine at 150 R.P.M. requires a current of 125-200 amperes, 5 volts. Lock torque is 24 lb. ft., current being 450-550 amperes at 2.75 volts. The starter brush tension should be 2¼ to 2¾ pounds each.

Mounting.—Starter is mounted at the right of the engine. To remove starter, remove three flange mounting screws and pull unit forward and out.

OILING.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month.

GENERATOR.—Model No. 182. The direction of rotation is clockwise looking at the commutator end. The third brush system is used for current regulation. To adjust the output, loosen the locknut on the generator end plate and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Generator brush tension should be 1½-1¾ pounds each.

Generator Data

Amperes.	R.P.M.
4.....	800
18-20.....	1600

Mounting.—Generator is cradle mounted. To remove, remove hexagon-headed nuts from hold-down clamp and lift generator from place.

OILING.—Put 5 or 6 drops of light engine oil in the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

FRANKLIN
Series 11 (1926)
Owen Dyneto System
Atwater Kent Ignition

Plate No. 1095

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

FRANKLIN SERIES 11 (1926)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM. ATWATER KENT IGNITION.

BATTERY:—Willard, Type XR-19. 6 volt, 135 ampere hour. The starting capacity is 146 amperes for 20 minutes. The negative (—) terminal is grounded.

IGNITION:—Coil Model N-7, Distributor Model RA. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil on the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month. Also place a small bit of vaseline on the face of the interrupter cam, applying with a toothpick.

Timing:—Breaker contacts begin to separate when Piston No. 1 entering power stroke is $\frac{3}{4}$ inch before top dead center (measured on the flywheel) when the mark 1-6 on the clutch is $\frac{3}{4}$ inch before top dead center with the spark control lever and breaker assembly in the fully retarded position. At this point the triangular mark on the fanwheel will be to the right of or before the center line on the fan wheel housing.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .031 inch.

STARTER:—Model DH. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes.
0 lb. ft.	2300	5.8	80
2 "	1100	5.44	140
3.5 "	980	5.3	185
6 "	610	4.9	256
23.2 "	Lock	3.4	590

Oiling:—Starter bearings are of the oilless type. They require no attention. Refill the oiler on the Bendix gear case with the pressure gun every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model CE. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system operating in conjunction with a compensating shunt field. Two shunt fields are used each being wound on two field poles. The light shunt field is connected between one main brush and the third brush; the battery being connected to these same brushes. The heavy shunt field is connected between the third brush and the other main brush. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.6	410			
9.8	7.3	600			
14	8	1000	12	8	800
11.4	8.2	2000			
9.8	8	3200			

To adjust the generator output, loosen the screw in the center of the knurled nut on the generator end plate and turn the nut clockwise to increase the charging rate and counter-clockwise to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this condition. Two brushes must be raised.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay contacts close at 410 R.P.M. of the armature when the voltage of the generator reaches 6.5 volts and open at 370 R.P.M. with a discharge current of 0-2 amperes. Contacts separate .025 to .040 inch. Air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Lighting Switch, Connecticut Model 194-Y. Head lamps and stop lamp are 6-8 volt, 21 cp.S.C. Dimmer lamps are 6-8 volt, 4 cp.S.C. Dome lamp is 6-8 volt, 4 cp.S.C. Dash and tail lamps are each 6-8 volt, 2 cp.S.C.

FUSES:—Lighting fuses are 20 ampere.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM,
DELCO IGNITION

BATTERY:—U.S.L. Type 3-HVX-5X. 6 volt. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 5272. Breaker contacts separate .014 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The manual advance provided is 33°. Automatic advance begins at 580 R. P. M. and reaches a maximum of 20-24° at 1400 R.P.M. The tension of the breaker arm spring should be 13-16 ounces.

Mounting:—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from position.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To time engine, loosen distributor cup clamp screw and turn distributor cup counter-clockwise until breaker contacts begin to separate. Make certain that rotor is under contact connected to cylinder which is ready to fire. Tighten the clamp screw after making the adjustment.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER:—Model No. 323. Starter is connected to the engine through a mechanical pinion shift combined with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 3/4 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
16 lb. ft.	Lock	3	

Mounting:—Starter is mounted at right of engine. To remove, disconnect pedal return spring and pedal connecting rod. Remove large pilot mounting screw and pull starter forward from position.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 291. Generator is belt driven and care must be exercised that the belt is not tight enough to cause undue wear on the bearings and yet not so loose that the generator armature will turn when the ignition switch is turned on. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by means of friction washers.

Generator Data.

Amperes.	R.P.M.
4	800
15	1600

The generator brush tension should be 1 1/4 to 1 3/4 pounds each.

Mounting:—Generator is mounted at left of engine and is belt driven. To remove generator, remove hinge shaft clamp screw and cotterpin at forward end of shaft and slide shaft to rear. Disconnect throttle rod. Loosen belt adjustment nut on generator, remove two water pump attaching screws and loosen fan belt at adjustment on engine block. Then work generator forward and uncouple water pump. Remove belts from pulley and lift generator out.

NASH **ADVANCED SIX** **MODELS 261-269 (1926)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION**

BATTERY:—Gould, Type OSL-617. 6 volt, 117 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5263. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 35°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 20-24° at 1400 R.P.M. The tension of the breaker arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted on right of engine. To remove, disconnect manual advance rod and remove nut on hold-down screw at bottom of housing. Then lift distributor from position.

Oiling.—Put 3 or 4 drops of light engine oil in the distributor oiler every 500 miles. If the track of the rotor button is not well polished, apply a very small amount of vaseline. Put a very small amount of soft vaseline on the face of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering the power stroke is on top dead center, spark control lever and breaker assembly in the fully retarded position. To time engine, loosen advance lever clamp screw and shift distributor cup in a counter-clockwise direction until breaker contacts begin to separate. Tighten clamp screw after making the adjustment. Make certain that the rotor is under the contact connected to the cylinder which is ready to fire.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .025 to .030 inch.

STARTER:—Model No. 271. Starter is connected to the engine through a mechanical pinion shift incorporated in the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
11 "	Lock	2.7	—

The tension of the starter brushes should be 2¼ to 2¾ pounds each.

Mounting.—Starter is mounted at right of engine. To remove, disconnect pedal return spring and pedal connecting rod. Then remove large pilot mounting screw and pull starter forward from its place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model No. 269. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Generator is belt driven, and care must be taken that the belt is not tight enough to cause undue wear to the armature bearings and should be so loose that the generator armature will rotate when the ignition switch is "On" with the engine stopped. To adjust the belt tension, loosen the clamp screws holding the generator to the engine and shift the position of the generator slightly.

Generator Data.	
Amperes	R.P.M.
Neutral	650
4	800
8	1000
17-19	1500
8-12	2300

The charging rate is varied by loosening the generator cover band and shifting the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The brush tension on each of the generator brushes should be from 1¼ to 1¾ pounds.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

CHRYSLER

**MODEL F-58 SERIAL NOS. WY 223-P UP (1926)
REMY GENERATING, STARTING AND LIGHTING SYSTEM.
REMY IGNITION**

BATTERY:—Willard Type LWR-13. 6 volt, 93 ampere hour. The starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.5 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-P Distributor Model No. 634-A. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. Manual advance is 20°. Automatic advance is 18°. The tension of the contact arm spring should be 20 ounces.

Oiling:—Screw down the grease cup on the side of the distributor housing two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month. Put 4 or 5 drops of light engine oil in the oiler on the auxiliary bracket every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .020 inch before top dead center with the manual advance lever in the fully advanced position.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .027-.030 inch.

STARTER:—Model No. 712-D. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M. taking 150 amperes at 5 volts. Starting switch is Model 404-S.

Starter Data.

Torque		R.P.M.	Volts	Amperes
0 lb. ft.		5000	5	65
11 "		Lock	3.6	450

The starter brush tension should be 28-32 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The bearing on the drive end of the starter is of the oilless type.

GENERATOR:—Model No. 951-C. The direction of rotation is counter-clockwise, looking at the commutator end. The generator is belt driven, and care must be taken to see that the fan belt is not tight enough to crowd the generator bearings and yet should not permit the generator to slip. The third brush system is used for current regulation. To adjust generator output, loosen the hexagon-headed screw on the generator end plate and shift the third brush. Shifting the brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the output. The maximum charging rate is 15-17 amperes reached at 1800 R.P.M. of the armature or 20.4 M.P.H.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	750			
7	7.4	925	11.6	7.85	1978
16	8.3	1800			

Running freely as a motor, generator makes 440 R.P.M. drawing 6.5 amperes at 7.1 volts. Field current is 4-6 amperes at 6 volts. The tension of the generator brushes should be 18-24 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model No. 265-B. Relay closes at 750 R.P.M. when the generator voltage reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between the relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Switch Model 475-B. Head and stop lamps are each 6-8 volt, 21 cp.
Dash, dome, side and tail lamps are each 6-8 volt, 3 cp.

FUSES:—Lighting fuse is 20 amperes.

PIERCE-ARROW

SERIES 33 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY.—Willard, Type SJR-6. 6 volt, 155 ampere hour. The starting capacity is 165 amperes for 20 minutes. The lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5265. A dual battery ignition system is used. The breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 24-29°. Automatic advance starts at 575 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. Contact arm spring tension should be 13-16 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and coupling and remove two hold-down screws in base of distributor. Then lift unit from place.

OILING.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

TIMING.—Breaker contacts begin to separate when the mark "Ignition" on the flywheel is 1¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position. The breaker controlling the right hand coil which fires the spark plugs on the exhaust side of the motor opens 30° to 70° (measured on the flywheel) before the intake breaker.

FIRING ORDER.—The firing order is 1-5-3-6-2-4.

SPARK PLUGS.—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER.—Model No. 252. The starter is connected to the engine through a mechanical gear shift. The two grounded motor brushes serve as a starter switch and are allowed to come in contact with the commutator when the gear shift is operated. This completes the circuit and permits the starter to crank the engine. When the starter button is released, a spring reverses these operations. The starter cranks the engine at 115 R. P. M. taking 180 to 300 amperes. Running free, the current is 50 amperes at 6 volts. Lock torque is 40 lb. ft. the current being 550-600 amperes at 2.75 volts. The brush tension should be 2¼ to 2¾ pounds.

Mounting.—Starter is mounted at right of engine on a special bracket mounting. To remove, disconnect pedal return spring and pedal rod and remove two hold-down screws in motor base. Then lift starter from place.

OILING.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR.—Model No. 279. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 22 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
3	600
22	1600

The average output required is 15 amperes. To adjust the charging rate, loosen the generator cover band and the lock nut on the commutator end of the generator. Then shift the third brush mounting plate, by means of the handle attached, in a counter-clockwise direction to increase the charging rate and the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment. The tension of the generator brushes should be 1¾ pounds each.

Mounting.—Generator is mounted at right of engine. To remove, disconnect coupling at either end of generator and remove hold-down from generator base. Then lift generator from position.

PIERCE-ARROW

SERIES 80 (1926)

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-4. 6 volt, 120 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor and Generator Model No. 300. The breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 40°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. The tension of the contact arm spring is 16-20 ounces.

Mounting.—Distributor is mounted on the generator. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from position.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

Timing.—Breaker contacts begin to separate when the mark "Ignition" on the fly-wheel is 2¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER.—Model No. 297. The starter is connected to the engine through a mechanical gear shift. The starter cranks the engine at 130 R.P.M. taking 150 to 300 amperes. Running free, current is 60 amperes at 6 volts. Lock torque is 19.5 lb. ft. with a motor terminal voltage of 3.5 volts. Brush spring tension should be 2¼-2¾ pounds each.

Mounting.—Starter is mounted at right of engine. To remove, disconnect pedal rod and remove three hold-down screws. Then slide starter forward and lift out.

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model No. 300. The direction of generator rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 18 amperes reached at 1500 R.P.M. of the generator armature or 20-25 M.P.H.

Generator Data.

Amperes	R.P.M.
4	800
17	2000

The average output required is 15 amperes. To adjust the the charging rate, loosen the generator cover band and shift the third brush mounting plate, by means of the handle attached in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Generator brush spring tension should be 1¾ pounds each.

Mounting.—Generator is mounted at right of engine. To remove, disconnect coupling at either end of generator and remove two hold-down screws in base. Then lift generator from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M.P.H. and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and the coil core is .015-.020 inch, contacts closed.

LIGHTING.—Combination Switch Model No. 1271. Head lamps are 6-8 volts, 21 cp. Auxiliary lamps are 6-8 volt, 4 cp. Dash and tail lamps are each 6-8 volt, 4 cp. Dome and tonneau lamps are 6-8 volt, 4 cp. All lamps have the single contact base.

FUSES.—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

DUESENBERG

STRAIGHT EIGHT (1926)

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Willard, Type SR-5, 6 volts, 116 ampere-hour capacity. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2135. Distributor Model 15735. The contacts separate .015-.020 inch. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 30°. Automatic advance begins at 750 R.P.M. and reaches a maximum of 25° at 2400 R.P.M. The contact arm spring tension should be 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack distributor housing with medium soft cup grease up to advance ring and yoke once each season. A very small amount of soft grease or vaseline should be applied to breaker cam every 2000 miles. Apply a very small amount of vaseline to rotor track occasionally during the first 2000 miles until rotor track becomes glazed, then no further attention will be necessary.

Mounting.—Distributor is mounted on the generator. To remove, disconnect manual advance rod and remove three screws holding distributor gear housing on generator. Then remove unit from position.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke, is 1/2 inch past top dead center, measured on flywheel, spark control lever and breaker assembly fully retarded. Timing can also be made by locating marks 1:4 on the flywheel through inspection plate on top of flywheel housing. Be sure that piston No. 1 is on compression stroke, contacts begins to separate one-half inch past top dead center measured on flywheel.

Firing Order.—The firing order is 1, 5, 3, 7, 4, 8, 2, 6.

Spark Plugs.—The spark plug diameters are 18 millimeters, gaps are 1/32 inch.

STARTER.—Model No. 200. The direction of rotation is counter-clockwise, looking at commutator end. Starter is connected to engine through a Bendix drive. Motor running free takes 50 amperes at 6 volts. Lock torque is 24 pound-feet at 2.75 volts. The brush tension should be 2 1/4 to 2 3/4 pounds on each of the starter brushes.

Mounting.—Starter is sleeve mounted at right of engine. To remove, remove tapered point pilot screw and pull starter forward from position.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once each year saturate the wick in the oiler on the end of the Bendix gear case with light engine oil.

GENERATOR.—Model No. 242. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 16-18 amperes, reached at 1600 R.P.M. of the armature. To adjust the charging rate, remove the cover band over the commutator and loosen the lock-nut on the end of the generator. Then shift the third brush mounting plate in a clockwise direction (direction of rotation) to increase the charging rate and in the opposite (counter-clockwise) direction to decrease the charging rate.

Generator Test Data

Amperes	Cold Test	R.P.M.	Amperes	Hot Test	R.P.M.
3 (Min.)		600	4 (Min.)		600
12		1000	13.5		1000
15-17 (Max.)		1600	16-19 (Max.)		1600
12		2400	13		2400

The brush tension of each of the generator brushes should be 1 1/4-1 3/4 lbs.

Mounting.—Generator is mounted at left of engine. To remove, disconnect generator drive coupling and loosen hold-down band. Then lift generator from place.

Oiling.—Fill generator oilers with light engine oil every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

Plate No. 1102

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

BATTERY.—Willard, Type SJR-4. 6 volt, 110 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 626-D. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a hard oilstone. The manual advance is 20°. Automatic advance is 20°.

Oiling.—Turn grease cup two turns and fill oil cup on driving end every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Timing.—Breaker contacts begin to separate when the top dead center mark on fly-wheel is 1/4 inch past the indicator, spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plug Gaps.—The spark plug gaps are .030 inch.

STARTER.—Model 720-D. The direction of rotation, looking at commutator end, is counter-clockwise. Cranking engine at 100-150 R.P.M. it takes 150 to 200 amperes. Starter is connected to engine through a Bendix drive.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
15 lb. ft.	Lock	3.15	570

Starter brush tension should be 20-28 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into starter oilers every month. If car is driven over 1000 miles per month, these attentions must be given every 1000 miles.

GENERATOR.—Model No. 912-B. Direction of rotation, looking at commutator end, is counter-clockwise. Current regulation is by the third brush system combined with a thermostat located in the shunt field circuit. With thermostat contacts open generator output is cut down approximately 50%. To adjust generator output, loosen cover band and screw on the generator end plate and shift third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate.

Cold Test			Hot Test

0	7.0	675			
7	7.2	750	11	8.2	1900
20	8.5	1800			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 16 ounces each.

Oiling.—Put 5 or 6 drops of light engine oil into generator oilers every two weeks. If car is driven over 500 miles in two weeks, these attentions must be given each 500 miles.

RELAY.—Model 265-A. Relay contacts close at 675 R.P.M. of the generator when the voltage reaches 7.2 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING.—Switch B. & S. Model 40042. Head lamps are each 6-8 volt, 21 cp. Dash lamp is 6-8 volt, 2 cp. Dome and tail lamps are each 6-8 volt, 6 cp.

FUSES.—All fuses are 20 ampere.

KISSEL
Model 75 (1926)
Remy System

Plate No. 1103

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

KISSEL MODEL 75 (1926) REMY GENERATING, STARTING AND LIGHTING SYSTEM.

BATTERY:—Willard, Type SJR-4. 6 volt, 110 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-L. Distributor Model No. 648-B. Breaker contacts separate .023 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The breaker uses two sets of contacts. They must be synchronized so that they open at the same instant. To adjust, set stationary contact and then move mounting plate until the other contacts begin to open. The gap must be kept the same on both contacts.

Oiling:—Turn down the grease cup on the side of the distributor housing two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 10° past top dead center (measured on flywheel) with the spark is 15°. Manual advance is 20°. The tension of the contact arm spring should be 17-20 ounces.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .030 inch.

STARTER:—Model No. 720-J. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 145 R.P.M. taking 175 amperes at 5.0 volts.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500-5000	5.5	65
2 "	1750	5.0	145
15 "	Lock	3.1	575

The starter brush tension should be 24 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the end bracket of the starter every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model No. 917-V The direction of rotation is counter-clockwise looking at the commutator end. Current regulation is by the third brush system and a thermostat located in the field circuit. To adjust the charging rate loosen the screw at the commutator, end of the generator and shift the third brush. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 19 amperes reached at 1800 R.P.M. of the armature or 26 M.P.H. Thermostat contacts open at 175° and cut a resistance into the shunt field cutting down the output approximately 50%.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	575			
7	7.1	850	9-11	7.8	1900
19	8.4	1900			

Motoring freely at 450 R.P.M. generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volt. Each coil, tested separately draws 10 amperes at 6 volts. The brush tension of each of the generator brushes should be 16-22 ounces.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model No. 265-B. Relay contacts close at 650 R.P.M. of the generator armature or 9 M.P.H. with a generator voltage of 7.0-7.5 volts and open at 500 R.P.M. or 7 M.P.H. with a discharge current of 0-1 ampere. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016-.020 inch, contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model No. 40042. Head lamps are volt, 21 cp.S.C. Dash, dome, stop and tail lamps are each 6-8 volt, 2 cp.S.C. Instrument lamp is 6-8 volt, 2 cp.D.C.

FUSES:—Lighting fuses are 20 ampere.

Model 30 (1926)
Delco System

Plate No. 1104

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

OLDSMOBILE

MODEL 30 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type XW-13. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2182. Distributor Model 5284. Breaker contacts separate .015-.022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. Distributor is of the full automatic type. Automatic advance begins at 600 R.P.M. and reaches a maximum of 28-30° at 2800 R.P.M. The tension of the contact arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted on the rear of the generator. To remove, loosen the timing adjustment clamp nut. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position .055 inch (measured on the flywheel) before top dead center. To time engine, loosen clamp nut on distributor housing and turn distributor cup in a counter-clockwise direction until contacts begin to separate. Then tighten the clamp nut. Make certain that the rotor is under the high tension terminal connected to cylinder No. 1.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027 inch.

STARTER.—Model No. 326. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter switch is Model 1952. Starter brush tension should be 2 1/4-2 1/2 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
12.5 lb. ft.	Lock	3	

Oiling.—Self-oiling bearings are used. They require no attention.

Mounting.—Starter is mounted at left of engine by a sleeve mounting. To remove, remove large pilot mounting screw and slide starter to rear and out.

GENERATOR.—Model No. 327. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the commutator cover band and shift the third brush mounting plate by the handle on the plate. Shifting the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction washers.

Generator Data.

Amperes	R.P.M.
5	800
12	1200

Generator brush tension should be 1 1/4 pounds each.

Mounting.—Generator is mounted at right of engine. To remove, loosen carburetor mounting screws and drop carburetor. Then remove three flange mounting screws and lift out generator, taking care to prevent timing chain slipping off sprocket and

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on the generator. Contacts close when the voltage of the generator reaches 6 3/4-7 1/2 volts and open with a discharge current of 0-3 amperes. Air gap between relay armature and coil core is .009-.010 inch, contacts closed.

LIGHTING.—Switch Model 1270. Head lamps are 6-8 volt, 21 cp. Dash, dome and tail lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker on the back of the switch takes the place of fuses. A current of 25-30 amperes causes this device to vibrate. While operating the current is 10-15 amperes.

LOCOMOBILE

JUNIOR EIGHT (1925-26)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM DEJON IGNITION

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

BATTERY.—U. S. L. Type 3-HVF-6X. 6 volt, 117 ampere hour. The starting capacity is 127 amperes for 20 minutes. Lighting capacity is 5 amperes for 23 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model CA-4008. Distributor Model IA-4008. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. Distributor has a manual advance of 10° and automatic advance of 15°. Automatic begins at 200 R.P.M. of the distributor and reaches a maximum of 15° at 1400 R.P.M. Condenser is mounted in the distributor housing and has a capacity of .20-.25 microfarads. The ignition coil draws 6.5 amperes cold at 6 volts reducing to 4-4.25 amperes within 30 seconds as the ballast resistor becomes heated. Tested without the ballast resistor, coil draws 12.5 amperes cold and 7.5 amperes hot. The maximum spark gap (between needle points and at atmospheric pressure) is .400 inch with a primary coil voltage of 6 volts and a distributor speed of 600-1600 R.P.M.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles if the car is driven more than 250 miles in a week.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, loosen tapered screw in center of breaker cam and turn cam in a counter-clockwise direction until the contacts begin to separate. Then tighten the screw. The cam is of the reversible type and must be placed with the arrow pointing in the direction of rotation (clockwise). The breaker arm is fitted with a flexible pigtail which must be intact.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .018 inch.

STARTER.—Model SA-4003. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starting switch is Model SW-4001.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.	40
.5 lb. ft.	2800	5.5	100
2.5 lb. ft.	1600	5.	200
4.7 lb. ft.	1000	4.5	300
7.3 lb. ft.	600	4.	400
20. lb. ft.	Lock	4.	800

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR.—Model DA-4006. Generator is mounted at left of engine and is fitted with a distributor drive. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, insert a screw driver in the slotted adjustment screw on the generator end plate and turn in a counter-clockwise direction to increase the charging rate and in a clockwise direction to decrease the charging rate. This screw turns the third brush mounting plate. With a maximum setting generator output is 16 amperes at 6 volts.

Continued on reverse side

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

DIANA EIGHT (1925-26) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—U. S. L. Type XY-15. 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Models 5282 and 5287. Breaker contacts separate .025 inch. Resurface contacts on a medium hard oilstone. Manual advance is 40°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 18-24° at 2000 R.P.M. The tension of the contact arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual advance control lever in the fully retarded position. This system uses two sets of contacts with a four-sided cam, the contacts opening alternately at intervals of 45° (distributor) corresponding to 90° of engine travel. Each breaker thus fires 4 cylinders. They must be set to open at exact points. To time engine, turn until flywheel marking DC/IEC is at indicator. Adjust stationary contacts so that they begin to separate. Tighten adjusting screw and turn engine over 90° until straight mark on flywheel is opposite indicator. Then adjust other set of contacts to just begin to separate. On Model 5282 this is done by loosening two hold-down screws and rotating the movable breaker plate. Tighten the two screws. On Model 5287, turn the eccentric adjusting screw which shifts one set of contacts on the plate.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 313. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 1/2 pounds each. Starter switch is Model 1953.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
13 lb. ft.	Lock	3.2	

Mounting.—Starter is mounted at right of engine. To remove, remove three flange mounting screws and lift starter to rear and out.

Oiling.—Starter bearings are self-oiling. They require no attention.

GENERATOR.—Model 325. The direction of generator rotation is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system combined with a stabilizing shunt field. The stabilizing field is a straight shunt field of comparatively small wire wound on two poles. It draws about 1 ampere at 6 volts. The third brush shunt field is wound on the other two field poles. To adjust the generator output remove the commutator cover band and shift the third brush mounting plate by the handle on the plate. Shifting the plate in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. It is held in any desired position by friction washers. Generator brush tension should be 1 1/4-1 1/2 pounds each.

Generator Data.	
Amperes	R.P.M.
5	800
8	1000
12-15	1600

Mounting.—Generator is mounted at right of engine. To remove, remove two mounting screws and slide generator to rear. Then lift from place.

OVERLAND

MODELS 91 AND 92 (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L. Type 3-CVX-5X. 6 volts. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model IG-4035. Distributor Model IG-4036A. Breaker contacts separate .018 inch, contacts fully separated. If condition of contact points affects ignition, remove and resurface on a hard oilstone.

Oiling:—Put 4 or 5 drops of light engine oil into the distributor oiler each week. If the car is driven over 250 miles in a week, this must be done each 250 miles.

Timing.—Breaker contacts just open when top dead center mark on flywheel is $2\frac{1}{2}$ inches before reaching dead top center indicator, on compression stroke, spark control lever and breaker assembly fully advanced.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plug diameters are $\frac{1}{2}$ inch. Gaps are .025 inch.

STARTER:—Model MG-1001. The direction of rotation looking at commutator end is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	60
.6 lb. ft.	2700	5.5	100
2.9 lb. ft.	1500	5	200
5.5 lb. ft.	850	4.5	300
8.2 lb. ft.	410	4	400
17.5 lb. ft.	Lock	4	600

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GP-4003A. The direction of rotation of the armature looking at commutator end, is counter-clockwise. The third brush system is employed for current regulation. Move third brush in counter-clockwise direction to increase the output and in the opposite direction to decrease the output. The maximum charging rate is 10-11 amperes (generator hot) reached at 1500 R.P.M. of the generator armature or approximately 20-25 miles per hour.

Generator Test Data					
Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	7	375	0	6.5	475
4	7.2	500	4	6.8	640
8	7.4	650	7	7.4	800
12	7.8	875	10	7.6	1200
15	7.9	1225	10.6	7.8	1540
16	8	1600	8.2	7.8	2400
13	7.8	2400			

Motoring freely generator draws 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling:—Put 8 or 10 drops of light engine oil into the generator oilers each week. If the car is driven more than 250 miles in a week, this oiling must be done each 250 miles.

RELAY:—Model CB-1078. Relay closes at 325-375 R.P.M. or 7-9 M.P.H. at 7-8 volts and opens at 275-325 R.P.M. of armature, or 5-7 M.P.H., 1-2 ampere discharge. Contact gaps separate .025 to .035. Core gap is .010-.015 inch, contacts closed.

LAMPS.—Head lamps, 6-8 volts, 21 cp., S.C. Dimmer resistance employed. Tail and dash lamps, each 3-4 volts, 2 cp., S.C.

Switches.—Lighting switch is Briggs and Stratton Model 38200.

FUSES.—One 20 ampere fuse is used.

OVERLAND.

Auto-Lite System

Plate No. 1108

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

OVERLAND

MODEL 93 (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION.

BATTERY:—U.S.L. Type 3-CVX-5X. 6 volt. The starting capacity is 96 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model IG-4060. Distributor Model IG-4057-A. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Turn up the grease cup on the distributor shaft two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke is 20° before top dead center (measured on the flywheel) with the spark control lever in the fully advanced position or when the piston reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model MN-4104. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5.	60
.6 "	2700	5.5	100
2.9 "	1500	5.	200
5.5 "	850	4.5	300
8.2 "	410	4.	400
17.6 "	Lock	4.	600

Oiling:—Put 4 or 5 drops of light engine oil in the starter oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model GP-4103. The direction of rotation is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system. To adjust the charging rate, loosen the generator cover band and the hexagon headed nut holding the third brush mounting arm and shift the third brush. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate.

Generator Data.

Cold Test			Hot Test

16	8.	1600	10.6	7.8	1540
13	7.8	2400	8.2	7.8	2400

Motoring freely, generator draws 4.5 amperes at 6 volts. Shunt field current is 2.2 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close at 350 R. P. M. of the generator with a generator voltage of 7.5 volts and open at 250 R.P.M. with a discharge current of 1-2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING:—Briggs and Stratton Switch Model 39320. Head lamps are 6-8 volt, 21 cp. S. C. Dash and tail lamps are connected in series. They are each 3-4 volt, 2 cp. S. C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse is 20 amperes.

WILLYS-KNIGHT

MODEL 65 (EARLY 1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type 3HVX-8X, 6 volt. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 4035. Distributor Model IG-4036B. Breaker contacts separate .018 inch contacts fully separated. If condition affects ignition, remove and re-surface on a hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil into timer distributor each week. If the car is driven over 250 miles in a week, this care must be given every 250 miles.

Timing.—Breaker contacts just open when flywheel is 12° late on compression stroke, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 3, 4, 2.

Spark Plugs.—Spark plugs, diameter 7/8 inch. Gap, .025 inch.

STARTER.—Model MH-4101. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-200 R.P.M., taking 250-300 amperes at 5 volts.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	40-60
1.3 lb. ft.	1500	5.5	100
5 lb. ft.	800	5	200
9 lb. ft.	400	4.5	300
17.5 lb. ft.	Lock	4	600

Oiling.—Pour 7 or 8 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles. Keep drive end bearing well lubricated.

GENERATOR.—Model GJ-4105. The direction of rotation looking at commutator end is counter-clockwise. The third brush system is used for voltage regulation. Move third brush in counter-clockwise direction to increase the output, and to decrease, in the opposite direction. The maximum charging rate is 12-13 amperes (generator hot) reached at 1700 R.P.M. of the generator armature or approximately 20-25 M. P. H.

Generator Test Data

Cold Test. (77°F.)			Hot Test. (167°F.)		
Amperes	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.8	500	0	6.8	600
4	7	580	4	7.3	740
8	7.6	650	8	7.8	950
12	8	950	11	8	1200
16.5	8.4	1700	12.7	8.2	1700
15	8.3	2400	11.6	8.1	2400
12.6	8.2	3200			

Motoring freely the generator takes 4-5 amperes at 6 volts. The shunt field current is 2.2 amperes at 6 volts. Each coil tested separately draws 8.8 amperes at 6 volts.

Oiling.—Pour 7 or 8 drops of light engine oil into generator oiler once a week. If car is driven more than 250 miles in a week, this care must be given each 250 miles.

RELAY.—Relay closes at 7-9 M.P.H., 500-550 R.P.M., 7-8 volts, and opens at 5-7 M.P.H. 450-500 R.P.M., 1-2 ampere discharge. Contacts separate .025-.035 inch; and air gap between relay armature and coil core is .010-.015 inch, contacts closed.

LIGHTING.—Briggs and Stratton Switch Model 40072. Head lamps are 6-8 volt, 21 cp. S. C. A dimmer resistance is used. Side lamps are 6-8 volt, 4 cp. S. C. Dash and tail lamps are connected in series. They are each 6-8 volt, 2 cp. S. C.

FUSES.—Fuses are 20 amperes.

DeJon System

Plate No. 1110

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

WILLYS KNIGHT

MODEL 66 (1926)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM DEJON IGNITION

BATTERY:—U.S.L. Type 3-HVX-8X. 6 volt. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 33.2 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CA-4010. Distributor Model IA-4010. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. Automatic advance begins at 150 R.P.M. of the distributor and reaches a maximum of 15° at 1500 R.P.M. Ignition current is 5 amperes with the resistance unit cold which decreases to 4.4.25 amperes within 30 seconds.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles if the car is driven more than 250 miles in a week. Keep the grease cup on the distributor shaft filled with pure vaseline and turn down one turn every week.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° before top dead center (measured on the flywheel) with the manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model SB-4008. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.	40
1.2 "	2200	5.5	100
4.1 "	1150	5.	200
7.3 "	760	4.5	300
10.5 "	500	4.	400
28.4 "	Lock	4.	930

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model DB-4003. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, insert a screwdriver in the slotted end of the third brush shifting shaft which is located on the generator end plate above the bearing retainer and turn the shaft in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 16 amperes at 8 volts reached at 1600 R.P.M. of the generator armature or 20 M.P.H. Shunt field current is 2.5 amperes at 6 volts.

Generator Data.

Cold Amperes	R.P.M.	Hot Amperes
0	500	0
2.75	600	1.5
10.5	1000	8.5
15.5	1600	13.0
11.75	2400	11.0
9.5	3600	8.75

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model RA-4001-A. Relay contacts close at 480-510 R.P.M. with a generator voltage of 7-7.5 volts and open with a discharge current of 0-2 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Head and stop lamps are each 6-8 volt, 21 cp.S.C. Side, tail, dash and dome lamps are each 6-8 volt, 3 cp.S.C.

Switch:—Lighting switch is Briggs and Stratton Model No. 38360.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

ROLLS ROYCE

MODEL 40-50 (1925-26) WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH BATTERY IGNITION

BATTERY.—Exide. Type 3-XX-21-1. 6 volt. The starting capacity is 163 amperes for 20 minutes. The lighting capacity is 5 amperes for 30 hours. The positive (+) terminal is grounded at the starting motor.

IGNITION.—A double ignition system using two coils and two distributor heads is used. The breaker contacts in both heads open simultaneously. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Mounting.—Distributor is mounted at right of engine on the governor control assembly.

Oiling.—Remove the plug on the gear case and give the gear compartment one charge of engine oil from the oil gun. Put 8 or 10 drops of engine oil in the oiler on the side of each of the distributors and put one drop of oil on the breaker arm pivot pin after removing the distributor head and rotor. Place a small bit of grease on the face of the breaker cam under the fiber bumper. This oiling must be done every 2,000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position when the flywheel marking "Li" is opposite the aluminum pointer above the flywheel, with the manual spark control lever in the fully retarded position. Both breaker contacts should open at the same time. Set timing by loosening the lock screw on the manual advance lever and rotating the distributor head until the breaker contacts separate. Then tighten the screw. Test ignition by running on one set of plugs by placing ignition switch lever in Positions 1 or 2. In service the car should always be run with double ignition.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plug gaps are .030 inch.

STARTER.—Frame No. 778, Style S-382435-A. Starter is connected to the engine through a system of epicyclic gears and chain to the transmission. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 70 R.P.M. Lock torque is 31 lb. ft. starter drawing 800 amperes at 4 volts. The pressure of the starter brushes should be 2½ to 3 pounds each.

Mounting.—Starter is mounted at the right of the transmission case under the floor boards of the front compartment.

Oiling.—Fill the starter bearing oilers with light engine oil every 2000 miles.

GENERATOR.—Frame No. 57-IR, Style S-416699. The direction of rotation is counter-clockwise, looking at the commutator end. Generator regulation is by a constant voltage relay-regulator. This causes the charging rate to vary with the condition of the battery giving a high rate when charging a discharged battery tapering off as the battery becomes charged. The maximum charging rate is reached at 1200 R.P.M. or 20 M.P.H. Charging rate is adjusted by increasing or decreasing the regulator spring tension by turning the regulator adjusting screw. Turning the screw in a clockwise direction increases the voltage and in the opposite direction decreases the voltage. This regulates the charging rate by changing the shunt field current.

Generator Data.

Amperes	Volts	R.P.M.
0.....		400
8.....		525
15.....		1200

Motoring freely generator draws 5 amperes at 6 volts. Shunt field current is 1.4 amperes.

Mounting.—Generator is mounted at left of engine.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

Continued on reverse side

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

LEXINGTON

CONCORD AND MINUTE MAN SIX (1926) AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION.

BATTERY:—(Concord) Willard, Type XW-15. (Minute Man) Willard, Type SJR-4. 6 volt, 105 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model 225-Y. Breaker contacts separate .012-.015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling:—Refill the cup under the distributor head with vaseline and turn down every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position at which the top dead center mark on the flywheel is two teeth after top dead center on the Concord model and when the exhaust closing mark on the flywheel is opposite the indicator on the Minute Man model. The spark control lever and breaker assembly should be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .020 inch.

STARTER:—Model 942. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $1\frac{3}{4}$ -2 pounds each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	50
9 " "	350	4	—

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model 1051. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate turn the small screw located on the commutator end plate. Turning the screw in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 13-14 amperes reached at 1500-1600 R.P.M. of the generator armature.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	425	0	6.4	500
7	6.8	800	4	6.5	800
12	7.5	1200	8.4	7.	1200
13.5	7.7	1600	9.8	7.2	1700
11.5	7.5	2400	8.6	7.	2400

The brush spring tension should be $1\frac{3}{4}$ -2 $\frac{3}{4}$ pounds each. Motoring freely, generator draws 6 amperes at 6 volts. Shunt field current is 2.3 amperes at 6 volts.

Oiling:—Put 3 or 4 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.5-7.5 volts and open with a discharge current of 0-2 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Connecticut Switch. (Concord) Model 198-1-Y. (Minute Man) Model 186-2-Y. Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 3 cp.S.C. Dome lamps are 6-8 volt, 4 cp.S.C. Dash lamps are 6-8 volt, 2 cp.D.C. Tail lamps are 6-8 volt, 3 cp.S.C. on the Concord model and 4 cp.S.C. on the Minute Man models.

FUSES:—Generator field fuse is 5 ampere. Lighting fuses are 15 ampere.

STUDEBAKER

MODEL ER (1926) STANDARD SIX REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type SJRR-3. 6 volt, 90 ampere hour. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-S. Distributor Model 626-K. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The distributor is of the full automatic type. Automatic advance is 25°.

Mounting.—Distributor is mounted at right of engine.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing:—Breaker contacts begin to separate when the flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To adjust timing, loosen the nut on top of the breaker cam and pry up the cam with a screw driver. Then rotate the cam in a counter-clockwise direction until the contacts begin to separate. Tighten the nut. A fine adjustment can be made by loosening the screw on the breaker plate and rotating the plate, a graduated scale being provided to gauge the movement. Tighten the screw after making the adjustment.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 720-M. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush pressure should be 20-28 ounces each.

Starter Test Data

Torque	Volts	Amperes	R.P.M.
0 lb. ft.	5	65	6000
15 lb. ft.	3.15	570	Lock

Mounting.—Starter is mounted at left of engine. To remove starter remove three flange mounting screws and withdraw starter from position.

Oiling.—Put 5 or 6 drops of light engine oil in starter oilers every month. If the car is driven more than 1000 miles in a month, the oiling must be done every 1000 miles.

GENERATOR.—Model 917-A. Generator current regulation is by the third brush system. Thermostat opens at 195° to 200° F., cutting down the maximum charging rate to 11 amperes. The direction of rotation is counter-clockwise, looking at the commutator end.

Cold Test			Generator Data			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.1	850	6.9		1450			
18-20	8.3-8.8	1800	11	8.2	1900			
17-10		2500						

The brush tension is 14-18 ounces. The field draws 4.85 amperes at 6 volts. Charging rate is varied by adjusting the third brush setting. Move the third brush in the direction of armature rotation to increase the charging rate, and against the direction of rotation to decrease the charging rate. Reseat the brush after position adjustment.

Mounting.—Generator is mounted at right of engine. To remove generator, remove three flange mounting screws and slide generator from position.

MODEL ER (1926) STANDARD SIX

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM.

WAGNER IGNITION.

BATTERY:—Willard, Type SJRR-3. 6 volt, 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model K-789. Distributor Model K-815. The breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Mounting:—Distributor is mounted at the right of the engine.

Oiling:—Put 4 or 5 drops of light engine oil in each of the oilers on the side of the distributor housing. Lift the spring arm on top of the breaker arm pivot and put 2 or 3 drops of light engine oil on the felt wick exposed. Remove the rotor and put several drops of oil in the oiler in the center of the breaker cam. These attentions must be given every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the mark on the flywheel "UP-DC" 1-6 is opposite the pointer on the right side of the flywheel housing, with the breaker assembly in the fully retarded position. To set timing, loosen screw in center of breaker cam and shift cam until the contacts begin to separate. Then tighten the screw. Provision is made for accurate setting by loosening the screw on the breaker plate and rotating the plate. A graduated scale is provided to gauge the setting. Tighten the screw after making the adjustment.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. S-533. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush pressure should be 1000 grams each.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5500	5.85	65
16 "	Lock	3.2	530

Mounting:—Starter is mounted at left of engine and is flange mounted. To remove starter, remove three flange mounting screws and slide starter to front. Then lift from position.

Oiling:—Put 4 or 5 drops of light engine oil in the bearing oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model No. S-509. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. The third brush mounting plate is held in position by a screw in the generator end plate. To adjust the charging rate, shift the third brush in the direction of generator rotation to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum output is 15 amperes reached at 1500 R.P.M. of the generator armature.

Generator Data.

Amperes	Volts	R.P.M.
0	7.2	580
10	7.75	1000
15	8.1	1500
8.5	7.68	3000

Operating freely as a motor, generator makes 300 R.P.M. taking 5 amperes at 6 volts. The brush pressure should be 550 grams each.

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type SJRR-4. 6 volt, 120 ampere hour. The starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 284-S. Distributor Model No. 626-L. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, resurface with a fine flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type. Automatic advance is 24°.

Mounting.—Distributor is mounted at front of engine.

Oiling.—Screw up the grease cup under the breaker head one-half turn every two weeks. If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing:—Breaker contacts begin to separate when flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the nut on the top of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to open. Then tighten the nut. For close setting loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model No. 723-A. Starter is connected to the engine through a chain drive and an overrunning clutch. The direction of rotation is clockwise, looking at the commutator end.

Starter Test Data			
Torque	Volts	Amperes	R.P.M.
0	5	70	1000
70	3.25	600	Lock

The starter brush pressure should be 20-28 ounces each.

Mounting.—Starter is mounted at right front of engine and drives through a chain and sprocket drive and overrunning clutch to the forward end of the crankshaft. Mounting is by special bracket to the engine block.

Oiling.—Put 4 or 5 drops of light engine oil in each starter oiler every 1000 miles. Once each year remove the grease plug in the reduction gear case and repack with graphite cup grease. Every three months oil the starter clutch in the sprocket on the engine crankshaft with light engine oil through the oil hole on the forward side.

GENERATOR.—Model No. 917-E. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. A thermostat in the shunt field circuit cuts in a resistance that lowers the generator output approximately 50%.

Generator Data					
Amperes	Cold Volts	R.P.M.	Amperes	Hot Volts	R.P.M.
0	Cut in	675			
7	7.1	850	6-9		1450

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM

WAGNER IGNITION

BATTERY.—Willard, Type SJRR-4. 6 volt, 120 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. K-789. Distributor Model No. K-814. Breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Mounting.—Distributor is mounted at front of engine.

Oiling:—Fill the oilers on the side of the distributor housing with light engine oil.

Remove the rotor and put several drops of oil in the oil hole in the center of the breaker cam. Lift the spring arm on the breaker arm pivot and put 2 or 3 drops of oil on the wick oiler exposed. This oiling must be done every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the flywheel marking "UP-DC-1-6" is opposite the indicator on the left side of the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the screw in the center of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to separate. Then tighten the screw. For close setting, loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. S-503. Starter is mounted at front of the engine and is connected to the crankshaft through a sprocket and chain. An over-running clutch is provided to prevent the engine driving the starter. The direction of rotation is clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1000	5.8	67
75 "	Lock	3.2	530

The starter brush pressure should be 1000 grams each.

Mounting.—Starter is mounted at right front of engine and drives to the forward end of the crankshaft. Mounting is by a special bracket to the engine block.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once every three months lubricate the starter clutch with light engine oil applying through the oiler provided. Remove the grease plug in the reduction gear case and repack the gears with graphite grease once each year.

GENERATOR:—Model No. S-508. The direction of rotation is counter-clockwise, looking at the commutator end. The generator is mounted vertically at the forward end of the engine. Current regulation is by the third brush system. The third brush mounting plate is held in position by a screw in the generator end plate. To increase the charging rate, move the third brush in the direction of generator rotation and in the opposite direction to decrease the charging rate.

Generator Data.

Amperes	Volts	R.P.M.
0	7.2	580
10	7.25	1000
16	8.1	1500
8.5	7.65	3000

Operating freely as a motor, generator makes 300 R.P.M. taking 5 amperes at 6 volts. The brush pressure should be 550 grams each.

Mounting.—Generator is vertically mounted at right front of engine. To remove generator, remove three flange mounting screws and lift unit from position.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

WILLS SAINTE CLAIRE

MODEL W-6 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION

BATTERY:—Willard, Type SJR-5. 6 volt. The starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5280. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. No manual advance is provided. Automatic advance begins at 250 R.P.M. and reaches a maximum of 53-57° at 900 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting:—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease or vaseline on the face of the breaker cam and on the rotor track in the distributor head every 1000 miles. Polish the distributor head and remove all excess grease with a soft clean cloth.

Timing:—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position of 7° before top dead center (measured on the flywheel). In this position the mark "T"/SP on the flywheel will be opposite the mark on the flywheel housing. To set timing, loosen screw in center of breaker cam and rotate cam until the contacts begin to separate. Then tighten the screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are metric standard. Gaps are .025 inch.

STARTER:—Model No. 310. The starter is connected to the engine through a manual gear shift incorporated with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
13 "	Lock	3.2	—

The starter brush tension should be 2¼-2½ pounds each.

Mounting:—Starter is mounted at left of engine by a sleeve mounting. To remove, disconnect pedal return spring and connecting rod and remove large pilot mounting screw. Then slide starter from place.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 311. The direction of rotation is counter-clockwise looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by means of friction washers.

Generator Data.	
Amperes.	R.P.M.
4	800
13-15	1600

The generator brush tension should be 1¼ to 1¾ pounds each.

Mounting:—Generator is mounted at right rear of the engine. To remove generator, remove floor boards, remove the two flange mounting screws. Then lift generator from place.

Continued on reverse side

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED. 1926

WILLS SAINT CLAIRE

MODELS B-68 AND C-68 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJR-5, 6 volt, 139 ampere-hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5235. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oil-stone. Two sets of contacts are provided. They operate with a four sided cam and open separately. Each breaker cam controls one coil and fires one bank of cylinders. The distributor is provided with manual and automatic advance. Manual advance is 45-50°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-22° at 2000 R.P.M. The breaker arm spring tension is 16-20 ounces.

Mounting.—Distributor is mounted at forward end of engine between the cylinder banks. To remove, disconnect manual advance rod and remove lock nut on clamp holding distributor housing. Then lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of medium heavy grease on the breaker cam and on the track in the distributor head every 1000 miles. After polishing the rotor track with a clean cloth, remove all excess grease.

Timing.—Breaker contacts firing right bank of cylinders begin to separate when piston No. 1 entering power stroke reaches a position 7° past top dead center (measured on flywheel) with the spark control lever and breaker assembly in the fully retarded position. This position is reached when the flywheel marking EC-1 is slightly past the indicator. Breaker contacts firing the left bank open when piston No. 8 reaches a similar position. The engine fires at intervals of 60 and 120° corresponding to 30 and 60° of distributor travel. These intervals must be accurately set. This may be done by connecting a test lamp in each circuit and noting the exact moment the contacts separate. If small scratches are made on the distributor housing opposite the rotor when the contacts separate the firing intervals can be measured. The straight line distances between the marks should be 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Firing Order.—Right hand bank of cylinders are numbered 1-2-3-4 from the radiator. Left hand bank are 5-6-7-8. Firing order is 1-8-2-7-4-5-3-6.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER-GENERATOR.—Model No. 207. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Two overrunning clutches are provided. In connection with the ignition switch a current in closed, allowing current to flow through the generator windings, causing armature to revolve slowly, aiding in the meshing of the reduction gears. One clutch permits this rotation, and also permits a relatively high speed of the armature, necessary when operating as a starter. The second overrunning clutch prevents the engine from driving the armature through the reduction gears. Depressing the starter pedal meshes the reduction gears, opens the generator circuit and allows the motor brushes to come in contact with the commutator, closing the starter circuit and cranking the engine. When pedal is released a spring reverses these operations. Starter cranks the engine at 100 R.P.M. requiring 265 amperes to breakaway the engine and drawing 50-75 amperes while cranking. Rotation is clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.....	Free.....	6.....	60
10 lb. ft.....	Lock.....	3.....	—

GENERATOR.—Generator current regulation is by the third brush system. Thermostat opens 190-200° F., cuts in Res., reducing charging rate 50 per cent.

BUICK
Standard and Master Six (1926)
Delco System

Plate No. 1119

BUICK
STANDARD AND MASTER SIXES (1926)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

BATTERY.—Standard Six, Exide, 3-XC-13-1, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

Master Six, Exide, Type 3-XC-15-1, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2188. Distributor Model 17046. Breaker contacts separate .015-.0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has both manual and automatic advance. Automatic advance begins at 450 R.P.M. and reaches a maximum of 15-18° at 2200 R.P.M. Manual advance is 24°. The breaker arm spring tension is 16-20 ounces.

Mounting.—Distributor is mounted on the rear of the generator at the right of the engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from its mounting.

Oiling.—A Zerk oiler is located on the side of the distributor shaft housing. Give this a charge from the pressure gun every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position at which the 17° mark on the flywheel is opposite the indicator on the flywheel case. This is 17° before top dead center. The manual advance lever must be in the fully advanced position. To set timing remove the plug at the bottom of the distributor shaft housing and loosen the timing adjustment screw. Then rotate the breaker cam until the contacts begin to separate. Tighten the screw after making the adjustment.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .027 inch.

STARTER.—Model 316. Starter is connected to the engine through a mechanically operated pinion shift incorporated in the starting switch and an overrunning clutch which prevents the engine driving the starter. The direction of rotation is counterclockwise, looking at the commutator end. Starter brush tension should be $2\frac{1}{4}$ - $2\frac{1}{2}$ pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6.0	60
1.5 "	1800	4.9	150
2.5 "	1400	4.7	200
5 "	825	4	300
18.25 "	Lock	3.2	500

Mounting.—Starter is mounted at right of engine by flange mounting. To remove starter, disconnect pedal return spring and pedal rod and remove three flange mounting screws. Then slide starter forward and lift from place.

Oiling.—Starter bearings are self oiling. They require no attention.

GENERATOR.—Model 317. The direction of rotation is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system. To adjust the output, remove the generator cover band and shift the third brush by means of the handle on the third brush mounting plate. Moving the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. The maximum charging rate of 18 amperes is reached at 1800 R.P.M. of the generator or 22 M.P.H.

MODEL 60 (1925-26)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Prest-O-Lite, Type 613-SHK. 6 volt, 112.5 ampere hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. The positive (—) terminal is grounded.

IGNITION.—Coil Model 284-P. Distributor Model 636-D. Breaker contacts separate .020-.028 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The distributor is of the combined manual and automatic type. Manual advance is 15°. Automatic advance reaches a maximum of 30° at 2000 R.P.M. The tension of the contact arm spring should be 17-21 ounces.

Oiling.—Fill the grease cup on the side of the distributor shaft with heavy cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month. Every 5000 miles put a small bit of vaseline on the face of the breaker cam and oil the wick in the oiler on the distributor shaft under the rotor with light engine oil.

Timing.—Breaker contacts begin to separate 7° before the point at which the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 720-G. Starter is connected to the engine by means of an out-board Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125-145 R.P.M. taking 150-175 amperes at 4.9 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
1.9 lb. ft.	1800	5.3	150
15 lb. ft.	Lock	3.2	575

Starter brush tension should be 20-28 ounces each. Starter switch is Model 405-D.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is of the oilless type.

GENERATOR.—Model 917-W. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system, combined with a thermostat located in the shunt field circuit. Thermostat contacts open at approximately 160° F. cutting a resistance into the shunt field and reducing the output 50 per cent. To adjust the generator output, loosen the clamp screw on the generator end plate and shift the third brush mounting bracket. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 18-20 amperes reached at 1800 R.P.M. of the generator or 23 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0		550	0		700
7	7.1	850	10.6	7.5	1800
18.5	8.5	1800	11	7.5	3000
14	8	2500			

The shunt field current is 4-6 amperes at 6 volts. Thermostat resistance is one ohm. Generator brush tension should be 22-28 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

PACKARD
Six (1926)
Owen-Dyneto System
Delco Ignition

Plate No. 1121

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

PACKARD

MODELS 326-333 SIX AND 236-243 EIGHT (1926)
OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.
DELCO IGNITION.

BATTERY:—Prest-O-Lite, (Six) Type 613-SHC. 6 volt, 112.5 ampere-hour. The starting capacity is 130 amperes for 20 minutes. The lighting capacity is 5 amperes for 22.5 hours. (Eight) Type 617-SHC. 6 volt, 160 ampere hour. The starting capacity is 170 amperes for 20 minutes. The lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION:—Delco Coil Model No. 2187 (six and eight) Delco Distributor Model No. 5249 (Six) and 5260 (Eight). Breaker contacts separate .020-.025 inch on the Six and .015-.020 inch on the Eight. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring should be 16-20 ounces. The distributor is of the combined manual and automatic advance type. Manual advance is 40°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M.

Mounting:—Distributor is mounted on top of the engine. To remove distributor, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease, the size of a match head, on the face of the breaker cam. Wipe out the distributor head and polish the rotor track with a bit of grease, removing all excess with a clean cloth.

Timing:—Breaker contacts begin to separate when Piston No. 1 on compression stroke reaches a position 2 inches before top dead center (measured on the flywheel) when the flywheel marking 'Upper D. C. Cylinder 1 & 6' is two inches before the dead center mark on the housing on the six cylinder car, and 1 3/8 inches before top dead center (measured on the flywheel) when the flywheel marking 'Upper D. C. cylinder 1 & 8' is 1 3/8 inches before the dead center mark on the housing on the eight cylinder car. The spark control lever and breaker assembly should be in fully advanced position.

Firing Order:—The firing order is (Six) 1-5-3-6-2-4 and (Eight) 1-3-2-5-8-6-7-4

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are 1/32 inch. Fuelizer spark plug gap is 1/8 inch. A cutout switch connected to the throttle lever short circuits the fuelizer spark plug on the Eight at high speeds. This device is not used on the Six

STARTER:—Model DH (Six), Model DM (Eight). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is a six pole, two brush machine having a single field coil. The field coil is so constructed that it winds around three sides of each coil alternating from one pole to the next so that each field pole is surrounded by a "U" shaped section of the coil.

Starter Data

Model DH		Volts	Amperes
Torque	R.P.M.		
0 lb. ft.	5000	6	60
25 lb. ft.	Lock	3.5	650
Model DM		Volts	Amperes
Torque	R.P.M.		
0 lb. ft.	3000	6	50
35 lb. ft.	Lock	3.5	650

Mounting:—Starter is mounted at left of engine by a standard sleeve mounting. To remove starter, remove the large pilot mounting screw and slide the starter forward. Then lift from place.

Oiling:—Starter bearings are fitted with oilless bushings. They require no attention.

PACKARD **MODELS 326-333 SIX AND 236-243 EIGHT (1926)** **OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO IGNITION.**

Continued from Page 1121

GENERATOR.—Models CE-523 and CG-678. Current regulation is by the third brush System. The generator is equipped with two shunt fields, each wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected across the same brushes as the light shunt field. The direction of rotation is counter-clockwise, looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.

Amperes.	Volts.	R. P. M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	3500

To adjust the generator out put loosen the screw in the center of the knurled nut on the generator end plate. Turn the nut to the left to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this position. Two brushes must be raised any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is probably shorted. The drive end bearing for the Model CG generator is in the engine. Before this machine can be run on the test bench a special bearing must be bolted on. This is Part No. 22196 and can be secured from the Owen-Dyneto Corporation.

Mounting.—Generator is flange mounted on the right of the engine. To remove generator, remove three flange mounting screws and pry the generator to the rear. Care must be taken not to remove the bronze plate between the generator and the chain case. Insert a screw-driver between the generator and the plate and slide the generator to the rear. Then lift from place.

Oiling.—The drive end of the generator is oiled by splash from the gear case. Put 4 or 5 drops of light machine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY.—The relay is mounted on top of the generator. Relay contacts close at 385-400 R. P. M. of the generator when the voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes.

LIGHTING.—Delco Combination Switch Model 1229 (Six) Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volts, 6 cp. Dome lamp is 6-8 volt, 8 cp. Dash and tail lamps are 6-8 volt, 2 cp.

Delco Combination Switch Model 1251 (Eight) Head lamps are 6-8 volt, 32 cp. Auxiliary head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 2 cp. (In head lamp bulbs). Dome lamp is 6-8 volt, 6 cp. Dash, tail and tonneau lamps are each 6-8 volt, 2 cp. All lamps have single contact base.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted in the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

DANIELS

MODEL 25-38 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone. Manual advance is 18-22°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 13-15° at 2400 R.P.M. The tension of breaker arm spring should be 16-20 ounces.

Mounting.—To remove distributor, disconnect manual advance rod and remove two hold down screws. Then lift distributor from place.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter 7/8 inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

Mounting.—To remove starter, remove starting pedal return spring and pedal rod. Then remove water pump. Remove motor hold down screws and lift from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Generator Data

Amperes	R.P.M.
0	600
12	1000
18-22	1450

The shunt field current is 2 amperes at 6 volts. The tension of the generator brushes should be 1 1/2-2 pounds each.

Mounting.—To remove generator, drain radiator and remove. Then jack up front end of engine and remove all engine bolts. Remove front gear cover and water pump. Then remove generator mounting studs and lift generator from place.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

CASE

MODEL J. I. C. (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJR-4. 6 volt, 105 ampere hour. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Maximum advance begins at 550 R.P.M. and reaches a maximum of 17-21° at 2000 R.P.M. Manual advance is 30°. The tension of the breaker arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then remove distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Every 1000 miles put a small amount of medium heavy cup grease on the surface of the breaker cam and polish the distributor head with a soft clean cloth.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded. Locate the breaker cam carefully, so that when the backlash in the distributor gears is rocked forward the contacts will open, and when the backlash in the gears is rocked backward the contacts will just close. The distributor shaft rotates clockwise when viewed from the top.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M. taking 275 amperes at 4 volts.

Starter Data

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	4000	6	36
27 lb. ft.	Lock.	2.75	500

Starter brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds each.

Mounting.—Starter is mounted at right of engine by a sleeve mounting. To remove starter, remove large pilot mounting screw and slide starter to rear and out.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. Saturate the wick oiler in the Bendix gear case with light engine oil once each year. Every six months remove the grease plug and repack the reduction gear case with medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the charging rate, move the third brush in the direction of rotation (counter-clockwise) and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 15-17 amperes, reached at 1600-1800 R.P.M. of the armature or 22-27 miles per hour. The main brush tension should be 25-30 ounces and the third brush tension, 20-30 ounces.

Generator Test Data

Amperes	Volts	R.P.M.
0 (Cuts in)	7-7.5	650
4.5		800
13-17 (Max.)		1600
9-12		2300

Generator motoring freely takes a current of 4 amperes, at 6 volts, at armature speed of 450 R.P.M. The field draws a current of 3 amperes, at 5 volts.

Mounting.—Generator is mounted at right of engine. To remove, disconnect generator drive coupling and remove four hold down screws. Then lift unit from place.

CASE

MODEL Y (1925-26)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—Willard, Type SJRR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5251. Breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. Manual advance is 38°. Automatic advance begins at 450 R.P.M. and reaches a maximum of 24-28° at 2000 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting.—Distributor is mounted at left of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Wipe out the distributor head with a small quantity of grease, removing all excess, and put a small bit of grease on the face of the breaker cam every month or each 1000 miles.

Timing.—Breaker cams begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever and breaker assembly in the fully retarded position. To set timing, loosen the screw in the center of the breaker cam and turn the cam until the contacts begin to separate. Then tighten the screw. Make certain that the rotor is under the segment connected to the cylinder entering power stroke.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model 208. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 110 R.P.M. taking a current of 300 amperes. Starter brush tension is $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	36
27 lb. ft.	Lock	2.75	—

Mounting.—Starter is sleeve mounted at right of engine. To remove starter, remove large pilot mounting screw and slide starter forward. Then lift from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Saturate the wick in the oiler at the end of the starter gear case every year. Remove the grease plug and repack the reduction gear case with medium heavy cup grease every six months.

GENERATOR.—Model 256. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers.

Generator Data	
Amperes	R.P.M.
5	700
17	1800

The generator brush spring tension should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Mounting.—Generator is mounted at left of engine. To remove generator, remove four hold down screws and lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

OAKLAND

MODEL 6-54-C (1925-26) SERIAL NOS. 64601-54 UP REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type CWR-15. 6 volt, 105 ampere hour. Starting capacity is 115 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 636-B. Breaker contacts separate .020-.028 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type, no manual advance is provided.

Oiling.—Refill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Remove the rotor and saturate the wick in the oiler on the distributor shaft with light engine oil every 1000 miles or each month. Place a small bit of vaseline on the face of the breaker cam applying with a toothpick.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches a position 5° before top dead center (measured on flywheel). To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. At this point the flywheel marking "UDC-1:6" will be opposite the indicator on the flywheel case. Place distributor indicator on breaker plate opposite the "0" of the scale and mount the distributor so that the contacts are just separating. Then loosen the clamp screws and rotate the distributor housing 5° or one half a division on the breaker plate scale in a counter-clockwise direction (opposite to direction of rotation). Tighten the screws. This will give a breaker opening 5° before top dead center.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 713-G. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter brush tension should be 20-24 ounces each. Starter switch is Model 406-A.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 lb. ft.	Lock	3.63	475

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the commutator end of the starter every 1000 miles or each month. At the same time fill the oiler on the drive end of the starter with a pressure oil gun.

GENERATOR.—Model 917-S. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system in conjunction with a thermostat. Thermostat contacts open at 195-200° F. and cut a resistance into the shunt field circuit decreasing the output approximately 50%. To adjust the generator output, loosen the screw on the generator end plate and shift the third brush mounting plate. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 18-20 amperes at 8.3-8.5 volts reached at 1900 R.P.M. of the generator.

Generator Data					
Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
0		675			
7	7-7.3	850	9-12	8-8.5	1900
18-20	8.3-8.5	1900			

The shunt field current is 4-5.9 amperes at 6 volts. The generator brush tension should be 22-28 ounces each. Motoring freely at 850 R.P.M. generator draws 7 amperes at 7.3 volts.

MODEL M (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L. 3 CVG-5X. 6 volt, 84 ampere hour. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.2 hours. The negative terminal is grounded.

IGNITION.—Coil Model No. 1 G-4063. Distributor Model 1G-4035D. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone after which the points should be thoroughly wiped with a clean rag. Points can be cleaned also with a "Tungsten point file."

Oiling.—Put 4 or 5 drops of light oil in the distributor wick oiler every two weeks or 200 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on the compression stroke is at top dead center with spark control lever and breaker assembly in the fully retarded position. Maximum spark advance 25°.

Firing Order.—The firing order is 1-3-4-2.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 to .030 inch.

STARTER.—Model No. MO-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 220 R.P.M. taking 180 amperes at 5.2 volts.

Starter Data			
Torque	R.P.M.	Volts	Amperes
2 lbs. ft.	1700	5.1	180
5 lbs. ft.	700	4.4	315
7 lbs. ft.	230	4.0	395
10 lbs. ft.	Lock	3.6	490

Oiling.—Self-oiling graphite bronze bearing used on commutator end. Put 8 to 10 drops of oil in oiler on drive end head every 1000 miles.

GENERATOR.—Model GT-4001A. The direction of rotation is counter-clockwise looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise) and in the opposite direction to decrease the charging rate. The maximum charging rate of 14 amperes is reached at 1450 R.P.M. of the generator armature of 25 M.P.H. car speed in high gear.

Cold Test (77°F.)			Hot Test (230°F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	510	0	7	600

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U.S.L. 3 CVG-5X. 6 volt 84 ampere hour. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.2 hours. The negative terminal is grounded.

IGNITION.—Coil Model No. 1G-4063. Distributor Model 1G-4067-A. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone after which the points should be thoroughly wiped with a clean rag. Points can be cleaned also with a "Tungsten point file."

Oiling.—Put 4 or 5 drops of light oil in the distributor wick oiler every two weeks or 200 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on the compression stroke is at top dead center with spark control lever and breaker assembly in the fully retarded position. Max. spark advance 25°.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8. Gaps are .025 to .030 inch.

STARTER.—Model MO-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 200 R.P.M. taking 180° amperes at 5.1 volts. Starter switch is Model SW-4001.

Starter Data

Torque	R.P.M.	Volts	Amperes
2 lbs. ft.	1700	5.1	180
5 lbs. ft.	700	4.4	315
7 lbs. ft.	230	4.0	395
10 lbs. ft.	Lock	3.6	490

Oiling.—Self oiling graphite bronze bearing used on commutator end. Put 8 to 10 drops of oil in oiler on drive end head every 1000 miles.

GENERATOR.—Model GT-4001A. The direction of rotation is counter-clockwise looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise), and in the opposite direction to decrease the charging rate. The maximum charging rate of 14 amperes is reached at 1450 R.P.M. of the generator armature or 25 M.P.H. car speed in high gear.

Generator Data

Cold Test (77°F.)			Hot Test (230°F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.5	510	0	7	600
4	6.9	680	4	7.1	820
10	7.5	960	10	7.5	1400
14	8.2	1450	12.5	8.0	2000

Oiling.—Put 4 or 5 drops of light engine oil in the oil cup on the commutator end of the generator every two weeks or each 500 miles. The drive end of the generator is oiled by the splash from the gears.

RELAY.—Model CB-4007. The relay closes at 550 R.P.M. of the generator when the voltage reaches 7 to 7.5 volts and opens with a discharge current of 0 to 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Headlamps are 6-8 volt 21 cp. S.C. Tail lamp is 6-8 volt 2 cp. S.C. Interior lamp is 6-8 volt 4 cp. S.C. Instrument board lamp is 6-8 volt 4 cp. S.C.

FUSES.—No fuse used on the lighting circuit. 5 ampere fuse used in the generator.

DURANT.
Model A-22 (1926)
Auto-Lite System.

Plate No. 1129

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

DURANT

MODEL A-22 (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM. AUTO-LITE IGNITION.

BATTERY:—U. S. L. Type 3-HVX-5X, 6 volt 92 ampere hour. Startig capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.2 hours. The negative (-) terminal is grounded.

IGNITION:—Coil Model No. IG-4013. Distributor Model No. IG-4018-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oil-stone.

OILING:—Put 4 or 5 drops of light engine oil in the distributor wick oiler every two weeks or each 250 miles.

TIMING:—Breaker contacts begin to separate when piston No. 1 on compression stroke is on top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER:—The firing order is 1-2-4-3.

SPARK PLUGS:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .027 inch.

STARTER:—Model MF-1096. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 140 R. P. M. taking 115 amperes at 5 volts.

Starter Data.			
Torque	R. P. M.	Volts.	Amperes
2 lb. ft.	1265	5	175.
5 "	735	5	305
8 "	315	5	425
10 "	Lock.	4	500

The pressure of the starter brushes on the commutator should be from $1\frac{3}{4}$ to $2\frac{1}{2}$ pounds each.

OILING:—Self-oiling graphite bronze bearings are used. They require no attention.

GENERATOR:—Model GH-1036. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise) and in the opposite direction to decrease the charging rate. The maximum charging rate of 16 amperes is reached at 2400 R. P. M. of the generator armature or 31.5 M. P. H., car speed in high gear.

Cold Test (77°F.)			Hot Test (230°F.)		
Amperes.	Volts.	R. P. M.	Amperes.	Volts.	R. P. M.
0	6.6	650	0	6.9	760
4	7.2	880	4	7.3	1050
10	7.8	1320	10	7.6	1600
16	8.3	2400	13.9	7.9	2560
12.	8.0	3820	12.	7.8	3650

The pressure of the main brushes on the commutator should be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds each. The third brush pressure should also be $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds.

OILING:—Put 4 or 5 drops of light engine oil in the oil cup on the commutator end of the generator every two weeks or each 500 miles. The drive end of the generator is oiled by the splash from the gears.

RELAY:—Model CB-1072. The relay closes at 675 R. P. M. of the generator when the voltage reaches 7 to 7.5 volts and opens with a discharge current of 0 to 2 amperes. Relay contacts separate .020 inch. The air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Nagel Combination Switch. Head lamps are 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are 6-8 volt, 2 cp. D. C. Side lamps are 6-8 volt, 2 cp. S. C.

FUSES:—Lighting circuit fuse is 20 ampere. No generator fuse is used.

HUDSON
Super-Six (1926)
American Bosch System

Plate No. 1130

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

HUDSON

SUPER-SIX (1926)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION.

BATTERY:—Prest-O-Lite, Type 615-JFK. 6 volt, 100 ampere hour. The starting capacity is 120 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model T-6322. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. If excessively worn, points should be replaced.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil and place one drop of oil on the interrupter lever pivot every month or each 1000 miles if the car is driven more than 1000 miles in a month. Place a small bit of medium heavy cup grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the flywheel marking "A" is opposite the indicator on the flywheel housing with piston No. 1 on compression stroke and manual spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are metric. Gaps should be .025 inch.

STARTER:—Model No. 949. Starter is connected to the engine through a manual gear shift incorporating a set of reduction gears and an overrunning clutch. Pressing down on the starting pedal meshes the gears and closes the starting switch allowing the starter to crank the engine. When the pedal is released, a spring reverses these operations. The starter cranks the engine at 150 R.P.M. taking 125 to 200 amperes. Rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3800	5.75	70
3.6 "	1000	4	200
7 "	500	4.5	300
16.25 "	Lock	3.5	525

Oiling:—Starter is equipped with oilless bearings. They require no attention.

GENERATOR:—Model No. 1282. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, insert a special Bosch key in the hole on the generator end plate above the bearing retainer plate and shift the third brush by turning the key. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The third brush may be shifted by hand by removing the commutator cover band.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
3	6.75	600	3	6.5	725
7	7.1	700	8	7.5	900
13	7.6	900	10	7.8	1000
17	8	1300	13	8	1350
13	8	1950	11	7.8	2000

Operating as a motor, the generator draws 6 amperes at 6 volts. The brush spring tension should be 1½ to 1¾ pounds each. The shunt field draws 6.6 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Turning off the ignition disconnects the generator and prevents the battery discharging.

LIGHTING:—Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 2 cp.S.C. Dash and tail lamps are connected in series. They are 3-4 volt, 2 cp. D.C. and S.C. respectively.

Switch:—Lighting switch is Model S-125.

FUSES:—Generator field fuse is 7.5 amperes. Lighting fuse is 20 amperes. Two spare fuses are provided in a holder at the bottom of the switch.

ESSEX

MODEL 1926

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK. 6 volt, 85 ampere hour. The starting capacity is 102 amperes for 20 minutes. The lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. TC-30. Distributor Model T-6200. Breaker contacts separate .020 inch. They are made of tungsten. The contact surface of both points should be flat. When the condition of the contacts affects the ignition, resurface them with a fine flat jeweler's file. If the points are excessively worn they should be replaced.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil. Put one drop of oil (never more) on the interrupter lever pivot. Place a small bit of cup grease, about the size of a match head, on the side of the interrupter fibre block nearest the pivot post. These attentions should be given every 1000 miles or each month.

Timing:—Breaker contact points begin to separate when, with piston No.1 on compression stroke, the mark on the flywheel is just opposite the indicator on the flywheel case. To adjust timing, turn engine until this position is reached. Then loosen the clamping nut on the stud just below the distributor and turn the housing in a counter-clockwise direction (opposite to direction of rotation) until the contacts begin to separate. Tighten the nut, being careful not to change the relative positions of the housing and shaft. The distributor is of the full automatic type. No manual advance is provided.

Firing Order:—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are metric standard. Gaps are .025 inch.

STARTER:—Model 964. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 1 3/4 to 2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft	3000	6	60
12 "	Lock	4	450

Note:—Starter model 948 has four brushes. For internal connections see motor diagram on preceding page.

Oiling:—Self-oiling bearings are used. They require no attention. Keep commutator clean and free from oil. Clean commutator by wiping it off with a clean cloth moistened with gasoline. Wipe dry before again using.

GENERATOR:—Model 1067. Generator current regulation is by the third brush system. To adjust the charging rate, insert the special Bosch key in the hole on the generator end plate and shift the third brush mounting plate by turning the key. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The third brush may be shifted by hand by removing the commutator cover band. The maximum charging rate is 13-14 amperes reached at 1600-1800 R.P.M. of the generator armature. Motoring freely the generator draws 6 amperes at 6 volts. The shunt field current is 3.2 amperes at 6 volts.

Generator Data

MODEL 1926

**AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM
AMERICAN BOSCH IGNITION**

Continued from preceeding page

Oiling.—Put two or three drops of light engine oil in each of the generator oilers every 500 miles or each two weeks. See that commutator is clean and free from oil. Clean commutator by wiping it with a clean cloth moistened with gasoline. Wipe dry before again operating the generator.

RELAY.—No relay is used. The circuit between the generator and the battery is controlled by the ignition switch. Turning off the ignition disconnects the generator and prevents the battery from discharging.

LIGHTING.—Combination Switch Type S-123. Head lamps are 6-8 volt, 21 cp. Dash and tail lamps are connected in series. They are each 3-4 volt, 2 cp.

FUSES.—No generator fuse is used. Lighting fuse is mounted on the back of the switch and is 20 ampere. Two spare fuses are mounted at the bottom of the switch.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

LOCOMOBILE

SERIES 48 (1926)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 12-11-SHC. 12 volt, 92.5 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2135. Distributor Model No. 5258. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Manual advance is 24-29°. Automatic advance starts at 600 R.P.M. and reaches a maximum of 15-18° at 2000 R.P.M. The tension of the contact arm spring should be 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in each of the oilers on the side of the distributor housing every 1000 miles. Remove the plug and fill gear compartment with very light gear grease to the level of the lower side of the horizontal shaft each six months. Put a small bit of vaseline on the breaker cam and wipe out the distributor head with a small bit of vaseline, removing all excess, every 1000 miles.

Timing.—Breaker contacts in the ignition circuit firing the plugs over the intake valves (rear distributor) begin to separate when the piston reaches a position 1/16 inch past top dead center entering power stroke with the spark control lever and breaker assembly in the fully retarded position. This position is approximately 1 1/2 inches past top dead center measured on the flywheel. Breaker contacts firing plugs over the exhaust valves open approximately 3-7° earlier than this.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027 inch.

STARTER.—Frame No. 779. Starter is connected to the engine through a magnetically operated pinion shift. The direction of rotation is counter-clockwise looking at the commutator end. Pinion should be pulled into mesh in 10% of one revolution with a current of 125 amperes and must not be held in by a current of 65 amperes.

Starter Data.

Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	Free.	5.5	65
3.5 "	2400	10.5	210
28.5 "	Lock.	6.0	750

The starter brush pressure should be 2.5 to 3 pounds each.

Oiling.—Put 4 or 5 drops of light engine oil in each of the oilers every 500 miles.

GENERATOR.—Frame No. 787-R. The direction of rotation is clockwise looking at the commutator end. Generator regulation is by an automatic voltage regulator. To increase generator output increase regulator voltage by turning the regulator adjusting screw in a clockwise direction. The maximum generator output is 10 amperes reached at 1250 R.P.M. of the generator armature.

Generator Data.

Amperes.	Volts.	R.P.M.	Field Amperes
0	13	450	1.8
4	13	500	1.6
10	13	800	1.4
10	13	1250	1.35

Motoring freely the generator draws 5 amperes at 12 volts. The field draws 1.5 amperes at 12 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY-REGULATOR.—Relay contacts close at 450 R.P.M. of the generator when the voltage reaches 12.4 volts and open with a discharge current of 0 to 3 amperes. Set regulator contacts at 1250 R.P.M. of the generator with an output of 10 amp-volt, 2 cp. S.C. With dimmer resistance, head lamps are 2 cp.

FUSES.—Ignition fuse is 20 amperes. All other fuses are 10 ampere.

LIGHTING.—Bryant Electric Co. four button Gang switch. Head and stop lamps are 12-16 Volt, 21 cp. S.C. Dash, dome, tonneau, side and tail lamps are each 12-16 peres at 13 volts. Relay air gap is .055-.060 inch. Regulator air gap is .055 inch. Center gap is .015 inch.

DORRIS

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

DORRIS

MODEL 6-80 (1925-26)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Magneto, Model AT-6. Breaker contacts separate .014-.016 inch. They are made of platinum. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or with well worn No. 00 sandpaper.

Battery Ignition.—Coil Model TC-31. Distributor Model TM-662. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The distributor is of the manual advance type.

Oiling.—Put 3 or 4 drops of light engine oil in the magneto oilers and in the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in month. Place a small bit of vaseline on the fiber bumper of the contact arm and on the face of the breaker cam in the battery distributor every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 10° before top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .018-.023 inch.

STARTER.—Model 1120. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 13/4-2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6	60
12 lb. ft.	Lock	4	450

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model 1243. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, loosen the hexagonal headed nut on the generator end plate and shift the third brush mounting bracket. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
3	6.75	600	3	6.5	725
7	7.1	700	8	7.5	900
13	7.6	900	10	7.8	1000
17	8	1300	13	8	1350
13	8	1950	11	7.8	2000

Motoring freely generator draws 6 amperes at 6 volts. Shunt field current is 6.6 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on the generator. Relay contacts close at 500 R.P.M. when the voltage of the generator reaches 6.5-7.5 volts and open at 450 R.P.M. with a discharge current of 0-3 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Cutler-Hammer Switch. Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps are 6-8 volt, 4 cp. S.C. Dash, tonneau, tail, inspection and stop lamps are each 6-8 volt, 4 cp. S.C.

FUSES.—Generator field fuse is 7.5 amperes. Lighting fuses are 15 amperes.

STEARN'S KNIGHT

MODELS S, B AND C (1925-26)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM DEJON IGNITION

BATTERY.—Exide, Type 6-XC-13-1. 12 volt. The starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The positive (+) terminal is grounded.

IGNITION:—(Four) Coil Model C. A. 4005. Distributor Model I. A. 4002-A. (Six) Coil Model C. A. 4003. Distributor Model I. A. 4004. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The coil draws 4.75-5 amperes with the resistance cold, decreasing to 2-2.1 amperes within 30 seconds. The six cylinder distributor is of the manual type. The four cylinder distributor is of the semiautomatic type, the automatic advance beginning at 100 R.P.M. and reaching a maximum of 150 at 1500 distributor R.P.M.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every 500 miles or each two weeks. Put a small bit of vaseline on the surface of the breaker cam under the fibre bumper every month.

Timing.—Breaker contacts begin to separate when piston entering power stroke is 1" after top dead center (measured on the flywheel) with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order of the four cylinder cars is 1-3-4-2. The firing order of the S and C models is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Models S. B. 4002 (Four) and S. B. 4003 (Six). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	Free.	5.	40
1 lb. ft.	3400	11.	100
3.6 lb. ft.	2250	10.	200

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

BATTERY.—Exide, Type 3-XC-13-1. Willard, Type XW-13. U. S. L., Type XY-13. 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 18 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center, spark control lever and breaker assembly fully retarded.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plug gaps are .025 inch.

STARTER.—Model No. 711-BX The direction of rotation looking at the commutator end is counter-clockwise. Starter is connected to motor by a Bendix drive. Cranks the at 160 R.P.M. taking 140 amperes. Starter brush tension should be 20-24 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
10 "	Lock	3.5	425

Oiling.—Put 4 or 5 drops of light engine oil into starter oiler every two weeks. If car is driven over 500 miles in two weeks, this care must be given every 500 miles.

GENERATOR.—Model No. 950-B. The direction of rotation is counter-clockwise looking at commutator end. The third brush system is used for voltage regulation. The maximum charging rate is 18 amperes reached at 1800 R.P.M. of the generator armature. Brush tension is 14-18 ounces each. Shunt field current is 5 amperes at 6 volts.

Generator Test Data

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	7.25	640			
7	7-7.3	880	12-15	8-8.5	1750
15-17	8.3-8.8	1750			
8.5-15.5		2500			

To adjust the generator charging rate, loosen the generator cover band and the screw on the generator end plate. Then shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Clum Switch Model 10441. Head lamps are 6-8 volt, 21 cp. S.C. Dash, dome and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES.—Lighting fuse on switch is 15 amperes.

FLINT

Plate No. 1136

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1926

FLINT

JUNIOR MODEL Z-18 (1926) SERIAL NOS. 101 UP AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type 3-RYF-6X. 6 volt, 92 ampere hour. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4063. Distributor Model IG-4118-A. Breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every 250 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Mounting.—Distributor is mounted on the rear of the generator. To remove distributor, remove the set screw and lift unit from place.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model MP-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 1 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	5	78
1 "	2800	5.2	150
2 "	2050	5	200
4 "	1320	4.5	300
8 "	300	3.5	500
11.5 "	Lock	2.6	530

Mounting.—Starter is mounted at right of engine. To remove starter, remove the mounting cap screws and slide starter forward from place.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the drive end of the starter every 1000 miles.

GENERATOR.—Model GY-4101. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush. Shifting the brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 15 amperes reached at 1500 R.P.M. of the generator or 25 M.P.H.

Cold Test (78°)

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	550	0	6.5	650
2	6.6	640	2	6.6	720
10	7.4	940	10	7.5	1200
15	7.85	1500	12	7.9	1700
12	7.6	2200	10	7.7	2400

Generator Data

Hot Test (240°)

Motoring freely at 150 R.P.M. generator draws 4.5 amperes at 6 volts. Shunt field current is 3.25 amperes at 6 volts. Generator brush tension should be 1 pound each.

Mounting.—Generator is mounted at right of engine by a bell housing. To remove, remove mounting cap screws and lift generator from place.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

RELAY.—Model CB-4007. Relay is mounted on top of the generator. Relay contacts close at 550 R.P.M. or 9 M.P.H. when the voltage of the generator reaches 6.4 volts and open at 8 M.P.H. with a discharge current of 1 1/2-2 1/2 amperes. Charging current at closing of contacts is 0-2 amperes. Contacts separate .025 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING.—Clum Switch Model 10544. Head lamps are each 6-8 volt, 21 cp. S.C. Dash, tail, side and dome lamps are each 6-8 volt, 3 cp. S.C.

FUSES.—Lighting fuse is 20 amperes.

HERTZ-AMBASSADOR
Model D1 (1925-26)
Delco System

Plate No. 1137

HERTZ-AMBASSADOR

MODEL D1 (1925-26)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Vesta, Type R6-DJ-13Y Form 235. 6 volt. Starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 12 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2182. Distributor Model 5278. Distributor is mounted on the generator. Breaker contacts separate .015-.0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The tension of the breaker arm spring should be 13-16 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. To set timing, retard spark lever and crank engine until piston No. 1 reaches this position. Then loosen the adjustment nut on the side of the distributor housing and rotate the distributor until breaker contacts begin to separate. Then tighten the nut. Make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model 286 and 313. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $2\frac{1}{4}$ - $2\frac{1}{2}$ pounds each. Starter switch is Model 1953.

Model 286 Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
8 "	Lock	3	450

Model 313 Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
11 "	Lock	3	450

Oiling.—Starter bearings are self oiling. They require no attention.

GENERATOR.—Model 301 and 312. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate by means of the handle on the plate. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The brush spring tension should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Model 301 and 312 Generator Data (Hot)

Amperes	R.P.M.
5	800
15 min.	1600

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 1-3 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING.—Switch Model 1276. Head and stop lamps are 6-8 volt, 21 cp. S. C. Side lamps are 6-8 volt, 4 cp. S. C. Tail and dash lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER.—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this device to vibrate. While operating the current is 10-15 amperes.

BATTERY.—Prest-O-Lite, Type 613-SHK. 6 volt. Starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-P. Distributor Model 626-J. Breaker contacts separate .020-.025 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 25°. Automatic advance is 30°.

Oiling.—Fill the grease cup on the side of the distributor housing with medium heavy grease and turn down two turns every two weeks or each 500 miles. Put a small bit of grease on the face of the breaker cam every month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 720-G. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces. Starter switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling.—Put 5 or 6 drops of light engine oil in the starter oilers every month or each 1000 miles.

GENERATOR.—Model 917-W. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. The thermostat contacts open at approximately 165° F. cutting a resistance into the field circuit and reducing the output 40-50%. To adjust generator output, remove commutator cover band and loosen the third brush adjusting screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Shunt field current is 5 amperes at 6 volts. Brush tension should be 16 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in each of generator bearing oilers every month or each 1000 miles.

RELAY.—Model 265-A. Relay contacts close at 550 R.P.M. of the generator when the voltage reaches 7.2 volts and open with a current discharge of 0-2.5 amperes. Contacts separate .014 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING.—Head and stop lamps are each 6-8 volt, 21 cp. Side, tail and dash lamps are each 6-8 volt, 2 cp.

FUSES.—Lighting fuses are 20 amperes.

AUBURN

MODEL 6-63 (1923-24)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Exide, Type 3-XC-15-1. 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-P. Distributor Model 626-H. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat jeweler's file. Distributor is of the semi-automatic type. Manual advance is 25°. Automatic advance is 30°.

Oiling.—Refill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper every two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 720-J. Starter is connected to the engine through a Bendix drive. Direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces each. Starter switch is Model 404-F.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling.—Put 4 or 5 drops of light engine oil in the oiler at the commutator end of the starter every month or each 1000 miles.

GENERATOR.—Model 917-R. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165° F. cutting a resistance into the field circuit and reducing the charging rate by approximately 50%. To adjust the generator charging rate, loosen the small round-headed screw on the generator end plate and shift the third brush mounting bracket. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustments.

Generator Data

AUBURN

MODEL 8-63 (1925)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—U. S. L., Type XY-15-X. 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 648-A. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor has both manual and automatic advance. Manual advance is 20°. Automatic advance is 15°.

Oiling.—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small bit of grease on the face of the breaker cam under the fiber bumper every month.

Timing.—Breaker contacts separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. The breaker uses double contacts which must be synchronized to open at the same instant. Set stationary contacts on high point of cam and shift plate on which other set of contacts are mounted until they also are on the high point of the cam.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 720-J. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces each. Starting switch is Model 406-A.

Starter Data

Torque	R.P.M.	Amperes	Volts
0 lb. ft.	6000	65	5
15 "	Lock	570	3.15

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR.—Model 917-V. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165°F. and cut a resistance into the shunt field circuit, reducing the charging rate approximately 50%. To adjust generator output loosen the round headed screw on the outside of the generator and plate and shift the third brush mounting arm by hand. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment.

MODEL 8-88 (1926)

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—U. S. L., Type XY-15X. 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 648-B. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. Set timing with the mark on the flywheel opposite the rib in the chain case, with the distributor fully retarded. Breaker uses double contacts which must be synchronized to open at the same instant. Adjust stationary contact to .022 inch when on the high point of the cam. Then shift mounting plate with movable contact so that it is also on the high point of the cam. The breaker gap must be kept within the limits of .018-.024 inch.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR.—Model 941-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. A thermostat located in the third brush circuit opens at 165° F. cutting a resistance into the shunt field and reducing the output approximately 50%. To adjust generator output loosen the small round headed screw on the outside of the generator end plate and shift the third brush mounting arm. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment.

Shunt field current is 5 amperes at 6 volts. Generator brush tension is 22-28 ounces each.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or 1000 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 675 R.P.M. of the generator armature when the voltage reaches 7.25 volts and open with a discharge current of 0-3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Briggs & Stratton Switch Model 39720. Head lamps are 6-8 volt 21 cp. Head lamp bulbs have double filament. Dimmer filament is 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 4 cp. D. C. Stop lamp is 6-8 volt, 4 cp. S. C. Dash and tail lamps are 6-8 volt, 2 cp. S. C.

FUSES.—Lighting fuse is 20 amperes.

NASH LIGHT SIX (AJAX) **AFTER APRIL FIRST (1926)** **AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM** **AUTO-LITE IGNITION**

NASH—(AJAX)
Late 1926
Auto-Lite System

Plate No. 1147

BATTERY.—U. S. L. Type 3-HVX-5X, 6 volt. The negative (—) terminal is grounded. The starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5-amperes for 18.4 hours. The battery is 7 7/16 by 9 3/4 by 9 1/8 inches.

IGNITION.—Coil Model IG-4065. Distributor Model IG-4110. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file. The surface of the contacts should be flat and parallel. The distributor is of the full automatic type. Automatic advance begins at 200 R.P.M. of the distributor and reaches a maximum of 15° (distributor) at 1200 R.P.M. This is equivalent to a flywheel advance of 30° at 2400 R.P.M. of the engine.

Oiling.—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks. Put one drop of light engine oil on the breaker arm hinge and place a small amount of vaseline on the face of the breaker cam every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plug.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model MN-4108. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 184 R.P.M. taking 160 amperes at 4.7 volts. Starter brush tension should be 1 1/4-1 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
.6 "	2700	5.5	100

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

BATTERY.—Willard, Type LWR-13. 6 volt. 98 ampere hour. Starting capacity is 107 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.6 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 525-E. Distributor Model 637-J. Breaker contacts separate .015-.020 inch. Resurface contacts with a tungsten contact file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 25°. Automatic advance is 15°. The tension of the breaker arm spring should be 15-20 ounces.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position .030 inch before top dead center with the manual spark control lever in the fully advanced position.

Mounting.—Distributor is mounted on top of the cylinder head. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are 0.27-.030 inch.

STARTER.—Model 714-D. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 178 R.P.M., taking 164 amperes at 5.1 volts. Starter brush tension is 26 ounces each.

Torque	R.P.M.	Volts	Amperes

REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Willard, Type CRR-15. 6 volt, 105 ampere hour. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Type CWR-15 is used on the Coach. The electrical characteristics are the same.

IGNITION.—Coil Model 284-A. Distributor Model 656-B. Breaker contacts separate .022 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Double contacts are used. They must be synchronized. Set stationary contacts to open .022 inch with the breaker arm on the high point of the cam. Then loosen screw holding mounting plate on which other contacts are mounted and shift until breaker arm is also on the high point of the cam. Adjust breaker gap being careful to keep it within the limits of .018-.024 inch. The tension of the breaker arm spring should be 17.5-20.5 ounces. Distributor is equipped with both manual and automatic advance. Manual advance is 25°. Automatic advance is 15°.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position .100 inch before top dead center with the manual advance lever in the fully advanced position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027-.030 inch.

STARTER.—Model 724-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 144 R.P.M. taking 157 amperes at 5.27 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2700	5.6	70
4.2 "	1200	5.0	200
12.0 "	350	4.0	400
16.5 "	150	3.5	500
22.5 "	Lock	3.0	600

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oiler every month or each 1000 miles.

GENERATOR.—Model 941-C. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165° F. cutting a resistance into the shunt field circuit and reducing the output approximately 50%. To adjust the charging rate loosen the small round headed screw on the generator end plate and shift the third brush mounting bracket. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 22-28 ounces.

Generator Data

Remy System

Plate No. 1150

CHRYSLER

IMPERIAL MODEL E (80) (1926) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Prest-O-Lite, Type A-617-SH. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 525-B. Distributor Models 656-C and 656-D. Breaker contacts separate .022 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Double contacts are used. They must be synchronized. Set stationary contacts to open .022 inch with the breaker arm on the high point of the cam. Then loosen screw holding mounting plate on which other set of contacts are mounted and shift until breaker arm is also on high point of cam. Set breaker contacts, being careful to keep gap within limits of .018-.024 inch. Distributor is equipped with both manual and automatic advance. Manual advance is 15°. Automatic advance is 30°. On the Model 656-D distributor, manual advance is 15°, and automatic advance is 18°.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks or each 500 miles.

Timing.—On cars using Distributor Model 656-C, breaker contacts begin to separate when piston entering power stroke reaches a position .010 inch before top dead center. With Distributor Model 656-D, piston position should be .040-.050 inch before top dead center. The manual advance lever should be in the fully advanced position in each case.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .028 inch.

STARTER.—Model 732-A. Starter is connected to the engine through a manual pinion shift incorporated in the starting switch. Starter drives pinion through reduction gears and Delco clutch, cranking the engine at 102 R.P.M., taking 117 amperes at 5.35 volts. The direction of rotation is clockwise, looking at the commutator end. Starter brush tension should be 20-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	65
32 "	Lock	3	600

A small auxiliary terminal is located on the starter frame. The battery levelite line is connected to it and is connected to the battery when the starter switch is closed.

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every 1500 miles. The reduction gear compartment is packed with graphite grease. A small pipe plug on the top of the gear case should be removed to add grease when this becomes necessary.

GENERATOR.—Model 945-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165° F. and cut a resistance into the field circuit, reducing the output approximately 50%. To adjust charging rate, loosen the small round headed screw on the outside of the generator end plate and shift the third brush mounting bracket. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 19 amperes, reached at 1600 R.P.M. or 24 miles per hour. Generator brush tension should be 22-28 ounces.

Generator Data

Cold Test (67° F.)			Hot Test (233° F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.58	495	0	6.95	670
16	8.5	1090	8	7.92	1108
19.2	8.95	1855	12	8.29	2075
16	8.78	2560	9.2	8.15	3520
9.4	8.35	3840	8.05	8.10	4000

Oiling.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every month or each 1000 miles.

Continued on reverse side.

CHRYSLER **IMPERIAL MODEL E (80) (1926)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM** **REMY IGNITION**

Continued from preceding page.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 600 R.P.M. of the generator armature when the voltage reaches 7.2 volts and open with a discharge current of 0-3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp., using double filament. A dimmer resistance mounted on the dimmer switch at the foot of the steering column is used for dimming. Stop and backing lamps are each 6-8 volt, 21 cp. S. C. Side, dash, dome, tail and tonneau lamps are each 6-8 volt, 3 cp. S. C. Battery solution level indicator lamp is 3-4 volt, 3 cp. D. C.

Switches.—Lighting switch is Model 475-S. Dimmer switch is Model 482-D. Carburetor Choke Control lever is Model 495-D.

FUSES.—Lighting fuses are 20 amperes.

CHRYSLER
 Model 80 (1926)
 Remy System

Plate No. 1150A

CHEVROLET

SUPERIOR MODEL K, SERIES (1926)

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

Plate No. 1151

BATTERY.—Exide, Type 3-XC-13-1. Willard, Type XW-13. U. S. L., Type XY-13. 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 18 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Mounting.—Distributor is mounted at right of engine.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center with the spark control lever in the fully retarded position. To set timing, retard spark control lever and crank engine until piston No. 1 reaches this position. Then loosen lock nut on top of breaker cam and pry cam upward. Rotate cam until breaker contacts begin to separate. Tighten the nut making certain that cam is correctly seated on taper shaft.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 710-C. Starter is connected to the engine through an outboard Bendix drive, Type R-11. The direction of rotation is counter-clockwise looking at the commutator end. Starter cranks the engine at 140 R.P.M., taking 100 amperes at 4.8 volts. Starter switch is Model 405-C. The tension of the starter brush is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	5	70
10 "	Lock	3.7	450

Mounting.—Starter is mounted at left rear of engine. To remove starter, remove two flange mounting screws and lift from place.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is self-lubricating.

GENERATOR.—Model 943-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, loosen the small screw on the generator end plate and shift the third brush mounting plate. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Test Data

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	850	11-13	7.55-7.85	1800
15-17	7.95-8.05	1600			
11		2500			

Shunt field current is 6 amperes at 6 volts. Generator brush tension is 16-18 ounces each.

Mounting.—Generator is mounted at left of engine by special mounting. To remove, remove special clamp screw and swing generator toward engine block. Slip off generator drive belt. Then remove two mounting screws and lift generator from place.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

REMY GENERATING, STARTING AND LIGHTING SYSTEM

REMY IGNITION

Continued from preceding page.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed. Charging current at closing of contacts is 1-3 amperes.

LIGHTING.—Switch Model 476-A. Head lamps are 6-8 volt, 21 cp. S. C. Side, dash, dome and tail lamps are each 6-8 volt, 3 cp. S. C.

FUSES.—Lighting fuse on back of switch is 20 amperes.

CHEVROLET
Superior Model K (1926)
Remy System

Plate No. 1151A

DODGE BROTHERS

LATE 1926

NORTHEAST GENERATING, STARTING AND LIGHTING SYSTEM

NORTHEAST IGNITION

BATTERY.—Willard, Type SJRR-4. 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 17,232-A. Distributor Model 10,786. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 20°. Automatic advance is 25°.

Mounting.—Ignition coil is mounted on cylinder head at front of engine. Distributor is mounted at right front of engine. To remove distributor, disconnect manual advance rod and remove distributor head. Then remove set screw and lift distributor from place. This set screw must always be kept tight when the distributor is in operation on the car.

Oiling.—Put a few drops of medium machine oil in the oiler on the side of the distributor housing every 2000 miles. At the same time lift the rotor button from place and put 2 or 3 drops of oil on the felt pad in the center of the breaker cam. Once each season place a small bit of medium heavy grease (No. 4 Keystone or equivalent) on the face of the breaker cam.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° past top dead center (measured on the flywheel) with the spark control lever in the fully retarded position. To check timing, retard spark lever and crank engine until piston No. 1 enters compression stroke. This is the upward stroke of the piston with both valves closed and may be checked by removing the spark plug and holding the thumb over the opening when the escaping air can be felt. Crank engine until piston reaches top dead center. On cars with ignition marking on flywheel, this point can be checked by observing the flywheel marking through the peephole in the flywheel case. The peephole is on the front of the flywheel case at the right of the engine. The top dead center mark is C/1-4. Then crank engine over 8° until the ignition marking "T" on the flywheel is opposite the mark on the edge of the flywheel case. At this point the exhaust valve in cylinder No. 4 is just closing and ignition can be set from this on cars without flywheel markings. The breaker contacts should just begin to separate at this point.

To set timing, loosen clamp screw in manual advance rod and turn distributor until oil cup is approximately above advance rod arm. Then tighten clamp screw and loosen mounting set screw. Lift distributor and disengage gears. Then rotate rotor button until it reaches a position just coming into line with segment connected to spark plug in cylinder No. 1. Remesh gears and tighten set screw. Then loosen clamp screw again and turn distributor until breaker contacts just begin to separate. Tighten the clamp screw. With proper setting of contacts breaker contacts will open by rocking the distributor rotor, the back lash of the gears being sufficient for this purpose.

Firing Order.—The firing order is 1-3-4-2.

Spark Plugs.—Spark plugs are S. A. E. Standard 7/8-18. Gaps are .025-.030 inch.

STARTER.—Type 6304-A (Four Brush) Superseded by Type 6304 (Two Brush).

Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4 pounds each. Starter switch is Model 15380.

Starter Data

Torque	R.P.M.	Volts	Amperes
4 lb. ft.	1200	4.9	220
6 "	900	4.6	280
7 "	600	4.6	350
9 "	300	3.8	430
12 "	Lock	3.4	500

Mounting.—Starter is mounted at left of engine by a Standard S. A. E. No. 2 flange mounting. To remove starter, remove four mounting screws and slide starter forward from place.

Oiling.—Starter bearings are of the oilless type. They require no attention.

Continued on reverse side.

DODGE BROTHERS

Late 1926

Northeast System

Plate No. 1152

DODGE BROTHERS

LATE 1926 NORTHEAST GENERATING, STARTING AND LIGHTING SYSTEM NORTHEAST IGNITION

Continued from preceding page.

GENERATOR.—Model LR, Type 6334, Superseded by Type 6334-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, loosen the screw marked "Lock" on the generator end plate and shift the third brush by turning the other screw marked "Adjust," located near the lock screw on the generator end plate. Tighten the lock screw after making the adjustment. With standard setting, the maximum charging rate is 15-16 amperes (hot) reached at 1200 R.P.M. of the armature or 23-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
8.....	8.....	510	8.....	8.....	620
12.....	8.....	700	12.....	8.....	800
16.....	8.....	740	14.5.....	8.....	1000
19.8.....	8.....	1000	14.5.....	8.....	1200
19.....	8.....	1200	12.....	8.....	1600

Running as a motor at 600 R.P.M. generator takes 2-3 amperes at 6.25 volts. Shunt field current is 4 amperes at 6.5 volts. Tested separately each coil draws 17 amperes at 5 volts. The brush tension is 1-1/4 pounds. A six ampere fuse is located in the shunt field circuit.

Mounting.—Generator is strap mounted at right of engine. To remove generator, disconnect generator lead and drive coupling. Loosen clamping strap nut and slide generator from place.

Oiling.—Put a few drops of medium oil in the oilers at each end of the generator every 2000 miles.

RELAY.—Model 15850. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7-7.25 volts at approximately 425 R.P.M. or 10 M.P.H. Charging current at closing of contacts is 1-2 amperes. Relay opens with a discharge current of 1-2 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .030 inch, contacts closed.

LIGHTING.—Briggs and Stratton Switch Model 40260. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dash and tail lamps are each 6-8 volt, 3 cp. S. C. Dome lamp is 6-8 volt, 4 cp.

BATTERY.—1924-25. Willard, Type XR-13. 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 18 hours. The negative (—) terminal is grounded. 1926 U. S. L. Type XY-13. 6 volt. Starting capacity is 86 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4047. Distributor Model IG-4051-A. Breaker contacts separate .018-.022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston No. 1 reaches top dead center on compression stroke with the spark control lever and breaker assembly in the fully retarded position. At this point the flywheel marking "1-4" will be opposite the indicator on the flywheel housing.

Firing Order.—The firing order is 1-3-4-2.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER. (1924-25) Model MG-4004. Starter is connected to engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	50
1 "	2250	5.5	100
3.4 "	1175	5	200
6.1 "	520	4.5	300
7.6 "	220	4.25	350
18 "	Lock	5	600

STARTER.—(1926) Model MN-4107. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	60
.6 "	2700	5.5	100
2.9 "	1500	5	200
5.5 "	850	4.5	300
8.2 "	410	4	400
17.5 "	Lock	4	600

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model GJ-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the commutator cover band and shift the third brush after loosening the hexagonal headed nut holding the third brush mounting arm. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Motoring freely, generator draws 4-5 amperes at 6 volts. Shunt field current is 2.2 amperes at 6 volts.

RELAY.—Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING.—Clum Switch Model 10365. Head lamps are 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Dash and tail lamps are 6-8 volt, 2 cp. S. C.

FUSES.—Lighting fuses are 20 amperes.

Plate No. 1156

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

ELCAR

MODEL 8-80 (1925-26)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO IGNITION

BATTERY.—U. S. L., Type XY-15. 6 volt, 105 ampere hour. The starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2182. Distributor Model 5277. Breaker contacts separate .020-.0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug gaps are .025 inch.

STARTER.—Model 240. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2¼-2¾ pounds each. Starter switch is Model 1953.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
12 "	Lock	2.75	—

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model 256.—The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the output, loosen the generator cover band and shift the third brush mounting plate by the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. The generator brush tension should be 1¼-1¾ pounds each.

Generator Data

Amperes	R.P.M.
5	700
18	1800

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on top of the generator. Relay contacts close at 600-800 R.P.M. of the generator when the voltage reaches 6.75-7.5 volts and open with a discharge current of 0-3 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING.—Switch Model 1246. Head and stop lamps are 6-8 volt, 21 cp. S. C. Side, dome and corner lamps are each 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

MODEL B-60 (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY.—U. S. L. Type 3-HVX-5X. 6 volt. Starting capacity is 106 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.4 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4063. Distributor Model IG-4118-A-C. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is of the semi-automatic type. Manual advance is 20°. Automatic advance begins at 350 R.P.M. and reaches a maximum of 20° at 3200 R.P.M.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles. Put a small bit of vaseline on the face of the breaker cam every month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Models MP-4102 and MN-4111. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter Model MP cranks the engine at 160 R.P.M. taking 145 amperes at 5.3 volts. Starter Model MN cranks engine at 120 R.P.M. taking 120 amperes at 5.4 volts. Brush tension should be 1 1/4-1 1/2 pounds each.

Starter Data—Model MP

Torque	R.P.M.	Volts	Amperes

7.2 "	650	4	400
13.5 "	Lock	3	540

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the drive end of the starter every two weeks or each 500 miles.

GENERATOR.—Model GY-4102-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust output, remove commutator cover band and move third brush mounting stud by tapping with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Maximum charging rate is 15 amperes reached at 1500 R.P.M. or 23 M.P.H. Generator brush tension should be 1 1/4-1 1/2 pounds each.

MODEL E-80 (1926)

DE JON GENERATING, STARTING, LIGHTING SYSTEM. DE JON IGNITION.

BATTERY: — U. S. L. Type 3-HVX-6X 6 volt, 117 ampere hour capacity. The starting capacity is 127 amperes for 20 minutes. The lighting capacity is 5 amperes for 23.4 hours. The negative (-) terminal is grounded.

IGNITION: — Coil Model No. CA 4001. Distributor Model No. 1A-4001. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface with a fine, flat jeweler's file. Ignition current is 6.3-6.5 amperes at 6 volts with ballast resistance cold. With resistance hot, ignition current is 3.5-3.6 amperes. On bench test secondary current will jump .391 inch between needle points and at atmospheric pressure with a distributor R.P.M. of 1000.

OILING: — Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles.

TIMING: — Breaker contacts separate when piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are 7/8 inch. SAE standard. Gaps are .022 to .025 inch.

STARTER: — Model No. SA-4001. The starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise looking at the commutator end.

Starter Data

Torque.	R. P. M.	Volts.	Amperes.
0 lb. ft.	2800	5.0	40
5 "	1600	5.5	100
2.5 "	1000	5.0	200
4.7 "	600	4.5	300
7.3 "	Lock.	4.0	400
20.0 "	Lock.	4.0	800

OILING: — Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles.

GENERATOR: — Model No. DA-4001. The direction of rotation is counter-clockwise looking at the commutator end. Current regulation is by the third brush system. To adjust the charging rate turn the third brush screw located on the generator end plate. Turning the screw to the right increases the charging rate and to the left decreases the charging rate.

Generator Data

Cold Test		Hot Test

GRAY

MODEL S (1925-26)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

BATTERY—U. S. L., Type 3-CVX-5X. 6 volt. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The positive (+) terminal is grounded.

IGNITION—Coil Model IG-4063. Distributor Model IG-4112-A. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the manual type. Manual advance is 50°. Ignition current is 1-3 amperes engine running and 3.4-5 amperes with engine stopped.

Oiling—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles if the car is driven more than 250 miles in a week. Put a small bit of vaseline on the face of the breaker cam under the bumper on the breaker arm every month.

Timing—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position.

Firing Order—The firing order is 1-3-4-2.

Spark Plugs—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER—Model MO-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 1 1/4-1 1/2 pounds each. Starter cranks the engine at 175 R.P.M. taking 125 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5	45 (Without Bendix)
0 "	Free	5	50 (With Bendix)
2 "	1700	5.1	180
5 "	700	4.4	315
7 "	230	4	395
10 "	Lock	3.6	490

Oiling—Put 5 to 10 drops of light engine oil in the oiler on the drive end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The commutator end bearing requires no attention.

GENERATOR—Model GW-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, remove the commutator cover band and shift the third brush mounting bracket by tapping the mounting stud with a screwdriver. Shift the third brush in the direction of armature rotation to increase the charging rate and in the opposite direction to decrease the charging rate. Maximum charging rate is 15 amperes at 8 volts.

Generator Data

Running freely as a motor generator draws 5 amperes at 6 volts. Shunt field current is 2.5 amperes at 6.2 volts. Generator brush tension should be 1 1/4-1 1/2 pounds each.

Oiling—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. The drive end bearing is oiled by splash from the gears.

RELAY—Model CB-4007. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Contacts separate .025-.035 inch. Air gap between armature and coil core is .010-.030 inch, contacts closed.

LIGHTING—Head and stop lamps are each 6-8 volts, 21 cp. S. C. Dash and tail lamps are each 6-8 volts, 2 cp. S. C.

FUSES—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

GARDNER

MODEL 6-B (1926) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

Plate No. 1161

BATTERY:—Prest-O-Lite, Type 611-SHK. 6 volt, 92.5 ampere hour. The starting capacity is 110 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.5 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-P. Distributor Model 636-H. Breaker contacts separate .020-.028 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25°. Maximum automatic advance is 30°. The tension of the breaker arm spring is 17-21 ounces.

Oiling:—Screw up the grease cup on the side of the distributor housing one or two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam and oil the wick oiler under the rotor with light engine oil every 5000 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the flywheel reaches a position 10° or approximately one inch past the mark on the flywheel housing. The manual spark advance lever should be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24 ounces.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 " "	Lock.	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 941-D. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system combined with a thermostat. The thermostat contacts open at approximately 160° inserting a resistance in the shunt field circuit and cutting down the output 50%. To adjust the generator output, loosen the screw on the generator end plate and shift the third brush mounting plate. Moving the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate of 18-20 amperes is reached at 1450 R.P.M. or approximately 25 M.P.H.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.3	750			
21	8.35-8.5	1450	11	7.5	1900

The brush tension should be 22-28 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model No. 265-B. Relay contacts close at 675 R.P.M. of the generator armature with a generator voltage of 7.25 volts. Charging current at closing of contacts is 3 amperes. Contacts open with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Combination Switch Model 420-H. Head lamps are 6-8 volts, 21 cp. S. C. Side, tail and dash lamps are each 6-8 volt, 3 cp.S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 4 cp.D.C.

FUSES:—Lighting fuses are 20 ampere.

Plate No. 1162

GARDNER **MODEL 8-B (1926)** **REMY GENERATING, STARTING AND LIGHTING SYSTEM.** **REMY IGNITION.**

BATTERY:—Prest-O-Lite, Type 617-RHK. 6 volt, 135 ampere hour. The starting capacity is 152 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-L. Distributor Model 648-B. Breaker contacts separate .020-.028 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20°. Maximum automatic advance is 15°. Breaker arm spring tension is 17-21 ounces. The breaker uses two sets of contacts with an eight lobed cam. The contacts must be synchronized so that they open at the same instant.

Oiling:—Screw up the grease cup on the side of the distributor housing one or two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Every 5000 miles place a small bit of vaseline on the face of the breaker cam and oil the wick oiler exposed when the rotor is removed with light engine oil.

Timing:—Breaker contacts begin to separate when the dead center mark for cylinders 1 and 8 on the flywheel is 10° or approximately one inch past the mark on the chain case cover. The ignition mark is on the front flywheel. To set timing, fully retard the manual advance lever. Then crank engine until piston No. 1 reaches top dead center on compression stroke. This is at the end of the upward stroke of the piston with both valves closed. Then turn the engine over 8° until the mark on the flywheel is opposite the mark on the chain case cover. Loosen the locknut in the center of the cam and shift cam until stationary set of contacts begin to separate. Tighten the locknut. Check contacts on movable plate to see that they open at the same instant. If they do not, loosen two screws holding mounting plate in position and rotate plate and contacts until they begin to separate. Then tighten the two screws. To make a close check on the contact opening, connect 6 volt lamps in the primary circuit and watch when they go out. When they do this the contacts are separating.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—The spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 24 ounces each.

Starter Data.

0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 941-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at approximately 160° and reduce the generator output 50%. To adjust the charging rate loosen the screw on the generator end plate holding the third brush mounting plate and shift the third brush. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 18-20 amperes reached at 1450 R.P.M. of the generator.

Generator Data.

H. C. S.
Taxicab (1925-26)
American Bosch System

Plate No. 1163

BATTERY.—Prest-O-Lite, Type 613-SHK. 6 volt. Starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-4242. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. If excessively worn, the points should be replaced.

Mounting.—Distributor is mounted on generator at left of engine.

Oiling.—Fill the oiler on the side of the distributor housing with light engine oil every month or each 1000 miles if the car is driven more than 1000 miles in a month. Put one drop of oil on the breaker arm pivot and place a small bit of vaseline on the surface of the breaker cam applying with a toothpick.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center.

Firing Order.—The firing order is 1-2-4-3.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .030 inch.

STARTER.—Model 952. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $1\frac{3}{4}$ pounds each. Starter switch is Model S-203.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6	60
12 "	Lock	4	450

Mounting.—Starter is mounted at right of engine by a standard S. A. E. No. 1 flange mounting.

Oiling.—Starter bearings are self oiling. They require no attention.

GENERATOR.—Model 1269. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate. Shifting the plate in the counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate is 16-18 amperes reached at 1100-1300 R.P.M. of the generator armature.

Generator Data

Amperes	Volts	R.P.M.
0	6.5-7.5	550
10		800
16-18	8	1100

Motoring freely generator draws 6 amperes at 6 volts. The shunt field current is 6.6 amperes at 6 volts. Field resistance at 70° F. is .9 ohms. Generator brush tension should be $1\frac{1}{2}$ - $1\frac{3}{4}$ pounds each.

Mounting.—Generator is mounted at left of engine by a standard S. A. E. No. 2 flange mounting.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on the generator. Relay contacts close at 500 R.P.M. when the voltage of the generator reaches 6.5-7.5 volts and open at 450 R.P.M. with a discharge current of 1-3 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed. The resistance of the shunt coil is 45 ohms.

LIGHTING.—Switch Model S-106. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Side lamps (in head lamp) are 6-8 volt, 6 cp. S. C. Dome and tail lamps are each 6-8 volt, 4 cp. S. C.

FUSES.—Generator field fuse is 7.5 amperes.

HUPMOBILE
Model A (1926)

BATTERY.—Willard, Type CRR-15. 6 volt, 105 ampere hour. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model IG-4061 and IG-4065. Distributor Model IG-4117-A. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine flat jeweler's file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 30°. Automatic advance begins at 1500 R.P.M. and reaches a maximum of 19-21° at 3600 R.P.M.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every month.

Timing.—Breaker contacts begin to separate when Piston No. 1 on compression stroke (with both valves closed) reaches top dead center with the manual spark control lever advanced one-half or midway between the fully retarded and fully advanced position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 in. Gaps are .025 inch.

STARTER.—Model MN-4109. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 160 R.P.M., taking 130 amperes at 4.8 volts. Starter brush tension should be 1 1/4-1 1/2 pounds each. Starter switch is Model SW-4002.

		Starter Data		
Torque	R.P.M.	Volts	Amperes	
0 lb. ft.	Free	5	45	(Without Bendix)
0 "	Free	5	50	(With Bendix)

4.8 "	950	4.5	300	
7.2 "	650	4	400	
13.6 "	Lock	3	620	

Mounting.—Starter is flange mounted at left of engine. To remove starter, remove three flange mounting screws and slide starter forward from position.

Oiling.—Put 5 to 10 drops of light engine oil in the oiler on the drive end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The commutator end bearing is oilless and requires no attention.

GENERATOR.—Model GJ-4112. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, remove the commutator cover band and shift the third brush mounting plate by tapping with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction between the holder stud and the generator end plate caused by the tempered steel spring in the end of the plate. Maximum charging rate is 16 amperes, reached at 1600 R.P.M.

HUPMOBILE

MODEL E-2 (1925-26) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

HUPMOBILE
Model E-2 (1926)
Auto-Lite System

Plate No. 1165

BATTERY.—Willard, Type SJR-6. 6 volt. 155 ampere hour. Starting capacity is 165 amperes for 20 minutes. Lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2182. Distributor Model 5295. Breaker contacts separate .0225-.0275 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Breaker uses double contacts with a four-sided cam, contact arms being set at an angle of 45° and opening alternately. Distributor is of the semi-automatic type. Manual advance is 38°. Automatic advance begins at 1600 R.P.M. and reaches a maximum of 21-26° at 3600 R.P.M. The tension of the breaker arm spring is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Wipe out the distributor head with heavy grease, removing all excess and polishing with a soft clean cloth every 5000 miles. Put a small bit of heavy grease on the face of the breaker cam under the fiber bumper of the contact arm every 1000 miles.

Timing.—Breaker contacts begin to separate when No. 8 piston on compression stroke (with both valves closed) reaches top dead center with the manual spark control lever in the half advanced position or midway between the fully retarded and fully advanced position.

Firing Order.—The firing order is 1-5-2-3-8-4-7-6.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022-.025 inch.

STARTER.—Model MR-4101. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M. drawing 100 amperes at 6 volts. Starter brush tension should be 1 1/4-1 1/2 pounds each. Starter switch is Model SW-4001.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.9	60 (Without Bendix)
0 "	Free	5.8	70 (With Bendix)
1.5 "	1225	5.7	100
6 "	700	5.4	200
12.5 "	450	4.95	300
18.5 "	300	4.5	400
44 "	Lock	4	820

Mounting.—Starter is barrel mounted at rear of flywheel housing at right of engine. To remove starter, remove large taper pointed pilot cap screw and locknut. Then slide starter from place.

Oiling.—Starter bearings are of the oilless type. They require no attention.

GENERATOR.—Model GXB-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, remove the commutator cover band and shift the third brush mounting plate by tapping on the third brush mounting stud with a screw driver. Moving the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction between the third brush mounting stud and the generator end plate. Maximum charging rate is 17 amperes at 8 volts.

Generator Data

American Bosch System

Plate No. 1167

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

BATTERY.—Willard, Type CRR-19. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model TC-30. Distributor Model T-8202. Breaker contacts separate .014 to .016 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil once each month or every 1000 miles, if the car is driven more than 1000 miles in a month. Put one drop of oil on the interrupter lever pivot and place a small bit of grease on the interrupter cam under the fibre bumper every three months.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the half advanced position.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. 937. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 93 R.P.M.

Starter Data.

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	2000	6	60
22 "	Lock	3.5	500

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 1261. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, remove the end-plate and loosen the slotted hexagon head screw which holds the third brush plate in position. Then move the third brush in a counter-clockwise direction (toward the engine) to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 16-18 amperes (cold) is reached at 1300 R.P.M. of the generator armature or 23 M.P.H.

Generator Data.

Cold Test.			Hot Test.		
Amperes.	Volts.	R.P.M.	Amperes.	Volts.	R.P.M.
0	6.75	550	0	6.5	625
7	7.	700	2.5	6.5	700
12	7.6	850	8	7.5	900
17	8.	1300	13	8.	1300
12.6	8.	2000	11	8.	2000
9.5	7.6	2800	9	7.	2800

Motoring freely the generator takes 6 amperes at 6 to 6.5 volts. The shunt field draws 6.1 to 6.8 amperes at 6 volts.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month, or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay is mounted on top of the generator. Relay closes at 500-600 R.P.M. when the generator voltage reaches 6.5 to 7.5 volts and opens at 400-500 R.P.M. with a discharge current of 0 to 3 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed. Clean relay contacts by drawing well worn No. 00 sandpaper between them. Remove all grit and adjust before again putting into service.

LIGHTING.—Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 6 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C. A vibrating circuit breaker protects all lighting circuits and horn circuit. The ignition current does not pass through the circuit breaker.

FUSES:—Generator field fuse is 7.5 ampere capacity.

LOCOMOBILE

MODEL 90 (1925-26)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM

DEJON IGNITION

Plate No. 1168

BATTERY.—U. S. L. Type 3-HVX-8Z. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model CA-4002. Distributor Model IA-4007. Breaker contacts separate .018-.020 inch. Resurface contacts in a medium hard oilstone or with a fine, flat tungsten contact file. Ignition current is 6.3-6.5 amperes at 6 volts reducing to 3.5-3.6 amperes when the ballast coil becomes heated. Distributor is of the semi-automatic type. Manual advance is 6°. Automatic advance begins at 200 R.P.M. (distributor) and reaches a maximum of 12.5° (distributor) at 1200 R.P.M. or 2400 R.P.M. of the crankshaft. Condenser is mounted in distributor housing and has a capacity of .20-.25 microfarads. When tested without ballast resistor, coil draws 11 amperes (cold) and 6.75 amperes (hot) at 6 volts. On bench test maximum spark gap between needle points at atmospheric pressure is .394 inch with distributor R.P.M. of 1000.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 500 miles if the car is driven more than 500 miles in a week.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, crank engine until piston on compression stroke (piston coming up—both valves closed) reaches top dead center. Then loosen tapered screw in center of cam and turn cam on shaft until breaker contacts begin to separate. Tighten the screw. Make certain that cam is replaced with arrow pointing in direction of rotation (clockwise.)

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .018 inch.

STARTER.—Model SB-4001. Starter is connected to the engine through an Eclipse manual shift Type E. S. 1. The direction of rotation is clockwise, looking at the commutator end.

Starter Data

Torque 0 lb. ft.	R.P.M.	Volts	Amperes
1.2 "	Free	5	40
4.1 "	2200	5.5	100
7.3 "	1150	5	200
10.5 "	760	4.5	300
28.4 "	500	4	400
	Lock	4	930

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model DD-4001. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, shift the third brush by turning the slotted third brush shifting shaft on the generator end plate above the bearing retainer. Insert a screw driver in the slot and turn the shaft to the left (counter-clockwise) to increase the charging rate and to the right or clockwise to decrease the charging rate. Maximum charging rate is 15.5 amperes (hot) reached at 1200 R.P.M. of the generator.

Generator Data

LOCOMOBILE **MODEL 90 (1925-26)** **DEJON GENERATING, STARTING AND LIGHTING SYSTEM** **DEJON IGNITION**

Continued from preceding page.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Model RA-4001-A. Relay is mounted on top of the generator. Relay closes at 450-500 R.P.M. when the voltage of the generator reaches 7-8 volts and opens with a current discharge of .5-2.5 amperes. Maximum charging current at closing of contacts is 5 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING.—Head lamps and stop lamp are each 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 3 cp. S. C. Dash, dome, side and tail lamps are each 6-8 volt, 3 cp. S. C.

Switch.—Lighting switch is Clum 10471.

FUSES.—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes.

Plate No. 1169

MARMON

MODEL D-74 (1926)

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 617-SHK. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor No. 17047. Breaker contacts separate .020-.0275 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Double ignition is used. Two coils are used and each ignition circuit is electrically separated, although only one distributor is used. Each primary circuit is controlled by one breaker arm, both operating from a single cam. In setting breaker gaps, synchronize contacts so that they both open at the same instant. Distributor is of the semi-automatic type. Manual advance is 40°. Automatic advance begins at 550 R.P.M. and reaches a maximum of 22-26° at 2000 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting.—Distributor is mounted on the rear of the generator. To remove, remove distributor head and disconnect two primary leads and manual advance rod. Then remove hold down screw and lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Every six months repack the distributor gear compartment with medium heavy cup grease.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7 teeth before top dead center as measured on the flywheel with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen timing adjustment screw and turn cam until contacts begin to separate. Both contacts must separate at the same instant. Tighten the screw and replace rotor, making certain that rotor button is under the segments connected to the spark plugs in cylinder No. 1.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—The spark plug diameters are 7/8-18 S. A. E. Gaps are .027-.032 inch.

STARTER.—Model 320. Starter is connected to the engine through a manually operated pinion shift incorporated in the starting switch. An over-running clutch is provided to prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
18.25 "	Lock	3.2	—

Mounting.—Starter is mounted at right of engine. To remove, disconnect pedal rod and return spring. Then remove two hold down screws and lift starter from place.

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model 319. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, remove the commutator cover band and shift the third brush mounting plate by prying on the handle on the plate. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. Generator brush tension is 1 1/4-1 3/4 pounds each.

Generator Data

Amperes	R.P.M.
4	800
8	1000
15	1600

Mounting.—Generator is mounted at left of engine. To remove, disconnect ignition leads, and manual advance rod and remove distributor head. Then loosen generator hold down clamp and lift generator and distributor from place.

Continued on reverse side.

Continued from preceding page.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .009-.010 inch, contacts closed.

LIGHTING.—Switch Model 1273. Head lamps are 6-8 volt, 21 cp. S. C. Stop lamp is 6-8 volt, 21 cp. S. C. Tonneau lamp is 6-8 volt, 4 cp. S. C. Dome lamp is 6-8 volt, 2 cp. D. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER.—A vibrating circuit breaker is mounted on the back of the switch. This device begins to operate when the current flow reaches 25-30 amperes and continues with a current flow of 10-15 amperes until the short circuit is removed.

Plate No. 1170

BATTERY.—Willard, Type SJR-4. 6 volt, 120 ampere hour. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5270. Breaker contacts separate .020-.025 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 30°. Automatic advance begins at 450 R.P.M. and reaches a maximum of 24-28° at 2000 R.P.M. Breaker arm spring tension should be 16-20 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect primary lead and manual advance rod. Then remove manual advance stop screw and lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the oilers on the side of the distributor housing every two weeks or each 500 miles. Put a small bit of medium heavy grease on the face of the breaker cam under the fiber bumper and wipe out the distributor head with heavy grease, removing all excess and polishing with a soft clean cloth every month or each 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing crank engine until piston No. 1 reaches this position. Then fully retard spark lever. Loosen timing adjustment screw and turn cam until breaker contacts begin to separate. Tighten the screw. Make certain that the distributor rotor button is under the segment connected to the spark plug in cylinder No. 1.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 313. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 3/4 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4.0	60
2 "	1750	5.5	175
13 "	Lock	3.0	450

Mounting.—Starter is flange mounted at right of engine. To remove starter, disconnect starter line and remove horn. Then loosen one screw in engine pan, remove starter mounting cap screws and lift from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless and requires no attention.

GENERATOR.—Model 258. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate remove the commutator cover band and shift the third brush mounting plate by means of the handle. Shifting the plate in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. Generator brush spring tension should be 1 1/4-1 3/4 pounds each.

MERCER

SERIES 6 (1925-26)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM

SPLITDORF IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Splitdorf, Type SS. Breaker contacts separate .020-.024 inch with the fiber bumper on the highest point of the cam. They are made of platinum. When the condition of the points affects the ignition, resurface with a fine, flat jeweler's file or with well worn No. 00 sandpaper.

Oiling.—Put 2 or 3 drops of light engine oil in the magneto oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Care must be exercised not to overoil the magneto as this causes much of magneto trouble.

Timing.—Breaker contacts begin to separate when piston No. 1 reaches top dead center on compression stroke with the spark control lever and breaker assembly in the fully retarded position. To time engine, rotate magneto drive shaft until breaker contacts just begin to separate. Then couple magneto to engine and connect spark plugs in correct order. Make certain that rotor is under segment connected to spark plug in cylinder No. 1.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model 1117. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $1\frac{3}{4}$ -2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6	60
12 "	Lock	4	450

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model 1250. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output loosen the hexagonal nut on the generator end plate and shift the third brush. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Data

Amperes	R.P.M.
0	550
10	800
17	1200
15	1600

Motoring freely, generator draws 6 amperes at 6 volts. Shunt field current is 6.6 amperes at 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on top of the generator. Relay closes at 550-600 R.P.M. when the voltage of the generator reaches 6.5-7.0 volts and open at 400-500 R.P.M. with a discharge current of 0-3 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 4 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

FUSES.—Generator field fuse is 7.5 amperes. Lighting fuses are 15 amperes.

OAKLAND

MODEL O. S. (1926) SERIAL NOS. 64523-54 UP REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

OAKLAND
Model 6-54-C (Late 1926)
Remy System

Plate No. 1173

BATTERY.—Willard, Type CWR-15. 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 636-J. Breaker contacts separate .020-.028 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type, no manual advance being provided. Rotation is clockwise, viewed from the top.

Mounting.—Distributor is mounted on top of engine block.

Oiling.—Refill the grease cup under the distributor head and turn down one turn every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper every month.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position when the flywheel marking "IGN" is opposite the indicator on the flywheel housing. To check timing, crank engine until piston No. 1 reaches this position. Then loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 713-G. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter brush tension is 24-28 ounces each. Starter switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting.—Starter is mounted by special sleeve mounting at right of engine.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. At the same time fill the oiler on the drive end of the starter with a pressure oil gun.

GENERATOR.—Model 941-M. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 195-200° F. cutting a resistance into the shunt field and reducing the output approximately 50%. To adjust the generator output, loosen the small round headed screw on the generator end plate holding the third brush mounting bracket. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate.

Generator Data

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
7	7.73	775	14	7.85	1800
17	8.15	1400			

Shunt field current is 5 amperes at 6 volts. Generator brush tension is 24-28 ounces.

Mounting.—Generator is flange mounted at right of engine.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at approximately 575 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

Continued on reverse side.

**MODEL O. S. (1926) SERIAL NOS. 64523-54 UP
REMY GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION**

LIGHTING.—Head lamps are 6-8 volt, 21 cp., double filament, using Tilt-Ray system for dimming. Dash, tail, dome and side lamps are each 6-8 volt, 3 cp. S. C.

Switches.—Lighting and Ignition switch is Model 475-L. Dimmer switch (mounted on foot board) is Model 465-A. Choke control is Model 495-C.

Circuits.—Switch is of special type controlling both lights and ignition with single lever. Switch positions are 1-2-3-4 right and 5-6 left. Circuits are as follows:

- 1 Vertical—All lights and ignition off.
- 2 Right—All lights off. Ignition on.
- 3 Right—Side and tail lamps on. Ignition on.
- 4 Right—Head lamps on. Tail lamp on. Ignition on. Operation of dimmer switch on toe board dims head lamps.
- 5 Left—Side and tail lamps on. Ignition off.
- 6 Left—Head and tail lamps on. Ignition off.

FUSES.—Lighting fuse on switch is 15 amperes. A spare fuse is mounted on the switch.

PACKARD

Model 3-26, 3-33 Six (Late 1926)

Delco Ignition

Owen-Dyneto System

Plate No. 1174

BATTERY.—Prest-O-Lite, (Six) Type 613-SHK. 6 volt. 112.5 ampere hour. The starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. (Eight) Type 617-SHK. 6 volt. 160 ampere hour. The starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Delco Coil Model No. 2187 (six and eight) Delco Distributor Model No. 5249 (Six) and 5260 (Eight). Breaker contacts separate .020-.025 inch on the Six and .015-.020 inch on the Eight. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring should be 16-20 ounces. The distributor is of the combined manual and automatic advance type. Manual advance is 40°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M.

Mounting.—Distributor is mounted on top of the engine. To remove distributor, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease, the size of a match head, on the face of the breaker cam. Wipe out the distributor head and polish the rotor track with a bit of grease, removing all excess with a clean cloth.

Timing.—Breaker contacts begin to separate when Piston No. 1 on compression stroke reaches a position 2 inches before top dead center (measured on the flywheel) when the flywheel marking "Upper D. C. Cylinder 1 & 6" is two inches before the dead center mark on the housing on the six cylinder car, and 1 3/8 inches before top dead center (measured on the flywheel) when the flywheel marking Upper D. C. cylinder 1 & 8 is 1 3/8 inches before the dead center mark on the housing on the eight cylinder car. The spark control lever must be in the fully advanced position.

Firing Order.—The firing order is (Six) 1-5-3-6-2-4 and (Eight) 1-3-2-5-8-6-7-4

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are 1/32 inch. Fuelizer spark plug gap is 1/8 inch. A cutout switch connected to the throttle lever short circuits the fuelizer spark plug on the Eight at high speeds. This device is not used on the Six.

STARTER.—Model DH (Six), Model DM (Eight). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is a six pole, two brush machine having a single field coil. The field coil is so constructed that it winds around three sides of each coil alternating from one pole to the next so that each field pole is surrounded by a "U" shaped section of the coil.

Starter Data

Model DH			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	60
25 lb. ft.	Lock	3.5	650

Model DM			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6	50
35 lb. ft.	Lock	3.5	650

Mounting.—Starter is mounted at left of engine by a standard sleeve mounting. To remove starter, remove the large pilot mounting screw and slide the starter forward. Then lift from place.

Oiling.—Starter bearings are fitted with oilless bushings. They require no attention.

Continued on reverse side.

PACKARD

MODELS 3-26, 3-33 SIX AND 2-36, 2-43 EIGHT (LATE 1926)
OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.
DELCO IGNITION.

Continued from preceding page.

GENERATOR.—Model CG-678. Generator current regulation is by the third brush system. The generator is equipped with two shunt fields, each wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected across the same brushes as the light shunt field. The direction of rotation is counter-clockwise, looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.		
Amperes.	Volts.	R. P. M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	3500

To adjust the generator out put loosen the screw in the center of the knurled nut on the generator end plate. Turn the nut to the left to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this position. Two brushes must be raised any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is probably shorted. The drive end bearing for the Model CG generator is in the engine. Before this machine can be run on the test bench a special bearing must be bolted on. This is Part No. 22196 and can be secured from the Owen-Dyneto Corporation.

Mounting.—Generator is flange mounted on the right of the engine. To remove generator, remove three flange mounting screws and pry the generator to the rear. Care must be taken not to remove the bronze plate between the generator and the chain case. Insert a screw-driver between the generator and the plate and slide the generator to the rear. Then lift from place.

Oiling.—Drive end of the generator is oiled by splash from the gear case. Put 4 or 5 drops of light machine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY:—The relay is mounted on top of the generator. Relay contacts close at 385-400 R. P. M. of the generator when the voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes.

LIGHTING.—Delco Combination Switch Model No. 1278. Head lamps are 6-8 volt, 21 and 2 cp. double filament bulb. The 2 cp. filament is used for dimming. Auxiliary head lamps are 6-8 volt, 21 cp. Dome lamp is 6-8 volt, 6 cp. Dash, tail and tonneau lamps are each 6-8 volt, 2 cp. All lamps except main head lamps are single contact base.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted in the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

MODEL 6-72 (1926) DELCO GENERATING, STARTING AND LIGHTING SYSTEM. DELCO IGNITION.

PEERLESS
Model 6-72 (1926)
Delco System

Plate No. 1175

BATTERY: — Exide, Type 3-XX-15-1, Willard Type XR-15. 6 volt, 105 ampere hour. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION: — Coil Model No. 2178. Distributor Model No. 5267. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 30°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M. Total automatic and manual advance is 53°. The tension of the breaker arm spring is 13-16 ounces.

Mounting: — Distributor is mounted at left of engine. To remove, disconnect primary lead and manual advance rod and remove distributor head. Remove advance lever clamp screw and lift distributor from place.

OILING: — Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of hard grease on the fiber bumper of the contact arm every month.

TIMING: — Breaker contacts begin to separate when the piston entering power stroke is 15° before top dead center (measured on the flywheel) as indicated by the mark on the flywheel and clutch housing, with the spark control lever and breaker assembly in the fully retarded position. To set timing, crank engine until No. 1 piston reaches this position. Fully advance spark control lever. Loosen advance lever clamp screw and rotate distributor housing until breaker contacts begin to separate. Then tighten the clamp and make certain that the rotor button is under the segment connected to the spark plug in cylinder No. 1.

FIRING ORDER: — The firing order is 1-5-3-6-2-4.

SPARK PLUGS: — Spark plug diameters are 7/8 inch. Gaps should be .025 inch.

STARTER: — Model No. 282. The starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 1/2 pounds each. Starter switch is Model 1953.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
11 "	Lock	2.8	570

Mounting: — Starter is barrel mounted at left of engine. To remove starter, disconnect starter lead and remove large pilot mounting screw. Then lift starter from place.

OILING: — Oilless bearings are used. They require no attention.

GENERATOR: — Model No. 284. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 18 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.		R. P. M.
Amperes.		
5		700
18		1600

To adjust the generator output, remove the commutator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate, and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction washers. The pressure of the generator brushes on the commutator should be 1 3/4 pounds each.

Mounting: — Generator is flange mounted at right of engine. To remove generator, disconnect generator lead and remove three flange mounting screws. The lower screw may be removed through a hole in the pan provided for this purpose. Then slide the generator from place.

OILING: — Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

Continued on reverse side.

PEERLESS
MODEL 6-72 (1926)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM.
DELCO IGNITION.

Continued from preceding page.

RELAY: — Model No. 5754. Relay contacts close at 8 M. P. H. when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. The contacts separate .030 inch. The air gap between the relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING: — Switch Model No. 1260. Head lamps are 6-8 volt, 21 cp. S. C. Signal lamp is 6-8 volt, 21 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Side, dash and tail lamps are each 6-8 volt, 2 cp. S. C.

CIRCUIT BREAKER: — A vibrating circuit breaker mounted on the back of the switch takes the place of fuses. A current of 25-30 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

MODEL 6-80 (1926)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L., Type XY-13X. 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17.4 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model IG-4065. Distributor Model IG-4118-B. Breaker contacts separate .020-.024 inch. Resurface contacts with fine, flat jeweler's file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is of the semi-automatic type. Manual advance is 20°. Automatic advance is 20°.

Mounting.—Distributor is mounted at right of engine forward of the generator. Mounting is by set screw and lock nut through the side of the distributor mounting bracket.

Oiling.—Refill the grease cup on the side of the distributor housing with medium heavy cup grease and turn down two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of vaseline on the face of the breaker cam every 1000 miles. Every 5000 miles put one drop of light oil on the interrupter arm pivot pin.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position two teeth on the flywheel before top dead center with the spark control lever in the fully advanced position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model MN-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M., taking 130 amperes at 5.2 volts. Starter brush tension should be 1 1/4-1 1/2 pounds each. Starter switch is Model SW-4001.

		Starter Data	
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
.5 "	2800	5.5	100
2.4 "	1450	5	200
4.8 "	950	4.5	300
7.2 "	650	4	400
13.6 "	Lock	3	540

Mounting.—Starter is flange mounted at right of engine. To remove starter, remove three flange mounting screws and slide starter forward from position.

Oiling.—Put 5 to 10 drops of light engine oil in the oiler on the drive end of the starter every month or each 1000 miles. The commutator end bearing is oilless and requires no attention.

GENERATOR.—Model GY-4102. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, remove the commutator cover band and shift the third brush mounting plate by tapping on the mounting stud with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction between the third brush mounting stud and the end plate. Maximum charging rate is 15.5 amperes at 8 volts.

Cold Test			Hot Test

14	1200	19			

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 3.2 amperes at 6 volts. Generator brush spring tension should be 1 1/4-1 1/2 pounds each.

Continued on reverse side.

PEERLESS
MODEL 6-80 (1926)
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION

Continued from preceding page.

Mounting.—Generator is mounted at right of engine. Mounting is by two cap screws which extend through the flange at the rear of the extension mounting bracket into the generator end plate.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY.—Model CB-4007. Relay is mounted on top of the generator. Relay closes at approximately 650 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING.—Clum Switch Model 10567. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dash, dome, side and tail lamps are each 6-8 volt, 3 cp. S. C.

FUSES.—Generator field fuse is 5 amperes.

PEERLESS MODEL 8-69 (1926) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION.

BATTERY.—Exide, Type 3-XX-19. 6 volt. Starting capacity is 146 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5297. Breaker contacts separate .0225-.0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 18-22°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 30° at 2800 R.P.M. The breaker arm spring tension should be 16-20 ounces. The breaker has two sets of contacts operating on a four sided cam. The contacts open alternately at intervals of 45° and these intervals must be accurately set to secure proper timing.

Mounting.—Distributor is mounted at forward end of engine between cylinder banks. To remove, disconnect manual advance rod and primary lead and remove distributor head. Then remove manual advance stop screw and lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor head every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the surface of the breaker cam every 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15° before top dead center (measured on the flywheel) with the manual spark control lever in the fully advanced position, or on top dead center with the manual advance lever one-half advanced or midway between the fully retarded and fully advanced positions.

Firing Order.—The firing order is 1R-1L-4R-4L-2L-3R-3L-2R.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .020-.025 inch.

STARTER.—Model No. 277. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4-2 3/4 pounds each. Starter switch is Model 1953.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	—	6.	50
13 "	Lock	3.2	—

Mounting.—Starter is mounted at right rear of engine. To remove, disconnect motor lead and remove four hold down screws in mounting base. Then slide motor forward and lift from place.

Oiling.—Oilless bearings are used. They require no attention.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, loosen the commutator cover band and shift the third brush arm mounting plate by means of the handle attached. Shifting the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any position desired by means of friction washers.

Generator Data.	
Amperes.	R.P.M.
4	800
17	1600

The generator brush tension should be 1 1/4-1 3/4 pounds each.

Mounting.—Generator is base mounted at left front of engine. To remove, disconnect generator lead and remove hold-down screws in mounting base. Disconnect coupling and lift generator from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Continued on reverse side.

PEERLESS
MODEL 8-69 (1926)
DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION.

Continued from preceding page.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0.3 amperes. Relay contacts separate .015 to .020 inch. Air gap between armature and coil core is .025 to .030 inch, contacts closed.

LIGHTING.—Combination Switch Model 1293. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament for dimming. Stop lamp is 6-8 volt, 21 cp. S. C. Side, dome, corner, dash and tail lamps are each 6-8 volt, 3 cp.

CIRCUIT BREAKER.—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes will cause it to vibrate limiting the current flow to 10-15 amperes until the cause of excessive current is removed.

Remy System

Plate No. 1178

BATTERY.—Prest-O-Lite, Type 613-JFKA. 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 525-C. Distributor Model 637-L. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type. Automatic advance is 18°.

Mounting.—Distributor is mounted on top of the engine block. To remove distributor, first remove distributor clamp screw then lift unit from place.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one turn every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center and the flywheel marking "IGN 1-6" is opposite the indicator in the crankcase peephole. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (upward movement of piston with both valves closed). Then loosen the distributor clamp screw and rotate distributor housing until breaker contacts begin to separate. Tighten the clamp screw after making the adjustment.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 714-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush tension is 24-28 ounces each. Starter switch is Model 405-C.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting.—Starter is mounted at left of engine by S. A. E. No. 1 flange mounting. To remove starter, first remove two flange mounting screws then lift starter from place.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is self-lubricating.

GENERATOR.—Model 943-C. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the small round headed screw on the generator end plate. Then remove the commutator cover band and shift the third brush mounting arm in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 17 amperes, reached at 1700 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	850			
15-17	7.95-8.05	1600	11-13	7.55-7.85	1800
11		2500			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 16-18 ounces.

Mounting.—Generator is mounted at left of engine by special mounting and is driven by the fan belt.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at approximately 660 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp. S. C. Dash, tail, side and dome lamps are each 6-8 volt, 3 cp. S. C.

FUSES.—Lighting fuse on switch is 20 amperes.

REO

MODELS E & G (1926) NORTH-EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH-EAST IGNITION

REO
Models E & G (1926)
North East System

Plate No. 1179

BATTERY.—Willard, Type SJRR-4. 6 volt. Starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 15381. Distributor Model T (On Generator). Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Never use emery cloth.

Oiling.—The distributor cap and rotor arm should be kept clean and dry. They ordinarily need no lubrication, because the carbon contacts are self-lubricating. Make sure that the carbon brush is free in its socket, also that the flat spring carrying the center contact is bent up sufficiently to make good contact with the distributor cap. See generator oiling instructions.

Timing.—Breaker contacts just begin to separate when piston No. 1 is on compression stroke and the flywheel mark "Spark/Max. Advance" is even with the top edge of the right hand engine support, with the spark control lever in the fully advanced position. This point is approximately 6 inches on the flywheel before the top dead center mark and timing can be checked by noting whether dead center mark is even with the engine support when piston No. 1 is on top dead center. To set timing, crank engine until piston No. 1 on compression stroke reaches this position. Then loosen locknut on breaker cam and rotate cam until breaker contacts begin to separate. Then tighten the locknut.

Firing Order.—The firing order is 1, 4, 2, 6, 3, 5.

Spark Plug Gaps.—The spark plug gaps are .025 inch.

STARTER.—Model SBR. Type 6237. Starter is connected to the engine through a ratchet and chain on a universal shaft. If the starter mechanism ever fails to engage or takes hold with a thump or pound when the starter button is depressed, it is an indication that there is not enough tension on the friction cable. On the other hand if the pawl is not brought entirely out of engagement when the starter button is released, there is too much friction on the friction cable. To adjust the tension slack off or draw up on the nut which holds the end of the rod. The starter cranks the engine at 100 R.P.M. drawing a current of 95-110 amperes at 5.5 volts. The direction of rotation is clockwise, looking at the commutator end (sprocket shaft). The armature rotation is counter-clockwise.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	960	6	30
1 "	720	5.75	46
5 "	460	5.5	95
10 "	330	5.1	150
15 "	250	4.6	190
50 "	Lock	3	430

The R.P.M. given in each case is that of the sprocket shaft. The armature rotation is higher.

Oiling.—Put 4 or 5 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. The reduction gear case is filled with No. 4 Keystone grease and requires very infrequent renewal.

GENERATOR.—Model MAT. Type 6089-L-6. (With Ignition). The direction of rotation is counter-clockwise, looking at driving end. The third brush system is used for current regulation. To adjust the charging rate, loosen lock screws on the commutator end housing. Then shift third brush by turning the adjustment screw, located below the lock screw. Both have slotted hexagonal heads. To increase the charging rate, the third brush must be shifted in a clockwise direction, looking at commutator end, and in the opposite direction to decrease the charging rate. Tighten the lock screw after making the adjustment. The maximum charging rate is 18 amperes reached at 1500 R.P.M. or 20 M.P.H.

Continued on reverse side.

American Bosch System

Plate No. 1180

RICKENBACKER

MODEL E-6 (1925-26)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Willard, Type CW-15. 6 volt, 105 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6294. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper and put one drop of oil on the interrupter arm pivot pin every month.

Timing.—Breaker contacts begin to separate when mark "0" on front flywheel is directly in the center on top with piston No. 1 on compression stroke. The spark control lever and breaker assembly should be in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen screw in center of breaker cam and rotate cam until contacts begin to separate. Then tighten the screw.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plugs are S. A. E. Standard 7/8-18. Gaps are .025 inch.

STARTER.—Model No. 966. Starter is connected to the engine through a manually operated pinion shift. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 150 amperes at 6 volts. Starter brush tension is 1 3/4 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	50
15 "	Lock	4	500

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model No. 1066. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, insert a special Bosch key in the hole on the generator end plate and shift the third brush by turning the key. The third brush may be shifted by hand by removing the commutator cover band. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 12-14 amperes, reached at 1600-1800 R.P.M. or 20 M.P.H.

0	6.5	600	0	6.4	600
5	6.75	700	7	7	1000
10	7.2	1000	9	7.2	1300
14	7.5	1600	10	7.4	1650
11.5	7.4	2400	8.6	7.2	2400

Motoring freely, generator draws 6 amperes at 6 volts. Shunt field current is 3.2 amperes with a terminal voltage of 6 volts.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay is mounted on top of the generator. Relay contacts close at approximately 600 R.P.M. of the generator when the voltage reaches 6.5-7.5 volts and open at 450 R.P.M. with a discharge current of 1-3 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Briggs and Stratton Switch. Head lamps are 6-8 volt, 21 cp., double filament, using the second 21 cp. filament for dimming. Stop and backing lamps are each 6-8 volt, 15 cp. Dash, tail, side, dome and corner lamps are each 6-8 volt, 2 cp.

FUSES.—Generator field fuse is 5 amperes. Lighting fuse is 20 amperes.

RICKENBACKER
Model B-8 (1925-26)
American Bosch Generating
Starting and Lighting System
Delco Ignition

Plate No. 1181

BATTERY.—Willard, Type CWR-19. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2190. Distributor Model No. 5292. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Manual advance is 25°. Automatic advance begins at 850 R.P.M. and reaches a maximum of 25° at 3600 R.P.M. Distributor uses two sets of contacts operating on a single cam. Breaker arms are set at an angle of 45° and open alternately.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks, or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of medium heavy grease or vaseline on the surface of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. Set timing when piston No. 1 reaches this position. Then check position of rotor to make certain that short segment of rotor button is under segment in distributor head connected to spark plug in cylinder No. 1. Loosen the screw in the center of the breaker cam and rotate cam until breaker contacts begin to separate. Then tighten the screw. Check opening of other set of contacts by rotating distributor shaft exactly 45° using a scale to check rotation and shifting breaker mounting plate until contacts open at the proper instant. They may also be checked by cranking engine over 90° from firing position of No. 1 cylinder when piston No. 6 will reach top dead center entering power stroke. The second set of contacts should open at this point.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch

STARTER.—Model No. 957. Starter is connected to the engine through a manually operated pinion shift and overrunning clutch. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. taking 120 amperes at 5.65 volts.

Starter Data			
Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	1800	6	60
.....	120	5.4	120
Lock.	0	5	550

Oiling:—Self-lubricating bearings are used. They require no attention.

GENERATOR.—Model 1066. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, insert the special Bosch key in the hole on the generator end plate and shift the third brush by turning the key. The third brush may be moved by hand by removing the commutator cover band. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 12-14 amperes reached at 1600-1800 R.P.M. of the generator or approximately 30 M.P.H.

Delco Ignition

Plate No. 1182

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 135 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5208. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. Distributor is of the semi-automatic type. Manual advance is 30°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 16-22° at 1600 R.P.M. The breaker arm spring tension should be 16-20 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, remove distributor head and disconnect breaker lead and manual advance rod. Then remove manual advance stop screw. Lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once a season. Apply a little vaseline to the rotor track occasionally during the first 2000 miles, after this, the track will be glazed, and it will be necessary to keep the track wiped clean with a clean cloth. Apply a very small amount of vaseline about the size of a match head to the surface of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 on compression stroke is at top dead center, mark "UD" on flywheel is opposite indicator on flywheel housing with the spark control lever and breaker assembly fully retarded. To set timing, crank engine until piston No. 1 reaches this position. Then fully retard spark control lever. Loosen timing adjustment screw in center of breaker cam and rotate cam until contacts begin to separate. Tighten the screw being careful not to disturb the adjustment. Check position of rotor button and see that it is under segment connected to spark plug in cylinder No. 1.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gap is .030 inch.

STARTER.—Model No. 200. The starter is connected to the engine by a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. When running free the starter takes 50 amperes at 6 volts. Lock torque is 24 pound feet at 2.75 volts. The tension on each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

Mounting.—Starter is mounted at right of engine at rear of flywheel housing. To remove starter, disconnect starter cable and remove large pilot mounting screw. Then slide starter to rear and lift from position.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler once a month. If the car is driven more than 1000 miles in a month, this care must be given every 1000 miles. Keep oil off the commutator. Keep dirt and grit off of Bendix drive to insure perfect operation. Saturate the wick oiler in the end of the Bendix gear case with light engine oil every year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate of the generator, remove the cover band, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate, and in the opposite direction (clockwise) to decrease the charging rate.

Generator Test Data	
Amperes	R.P.M.
5	700
11	1000
16-18	1600
15	2000

The tension of each of the generator brushes should be from 1 1/4 to 1 3/4 pounds.

DELCO GENERATING, STARTING, AND LIGHTING SYSTEM
DELCO IGNITION

Continued from prece ding page

Mounting.—Generator is base mounted at left of engine. To remove, disconnect generator lead and coupling. Then remove hold down screws and lift generator from place.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 8-9 M.P.H. or at 7-8 volts, and opens with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, fully separated. The air gap between relay armature and coil core is .015-.020 inch, contacts fully closed.

LIGHTING.—Combination Switch Model No. 1246 is used. The head lights are each 6-8 volt, 32 cp. Auxiliary and side lamps are each 6-8 volt, 4 cp. Stop light is 6-8 volt, 15 cp. Dash, tail, dome and tonneau lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER.—A circuit breaker mounted on the back of the combination switch is used in the place of fuses. A current flow of 25-30 amperes will cause circuit breaker to operate, and it will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Prest-O-Lite, Type 617-SHK. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2191. Distributor Model 5296. Breaker contacts separate .0225-.0275 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Breaker uses two sets of contacts with a four-sided cam, contacts opening alternately at intervals of 45°, corresponding to 90° of crankshaft travel. Ignition coil has two secondary windings connected to separate high tension terminals of the distributor and firing a double set of plugs. Distributor is equipped with both manual and automatic spark advance. Manual advance is 30°. Automatic advance begins at 700 R.P.M. and reaches a maximum of 24° at 2000 R.P.M. Breaker arm tension is 16-20 ounces.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 5 teeth before top dead center measured on the flywheel with the spark control lever in the fully advanced position.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are metric standard. Gaps are .025 inch.

STARTER.—Model 334. Starter is connected to the engine through an over-running clutch and a manual pinion shift incorporated in the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2¼-2½ pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
11.5 "	Lock	2.75	500

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model 333. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, shift the third brush mounting plate by turning the screw on the generator end plate. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 12 amperes is reached at 1600 R.P.M. or 25 M.P.H.

Generator Data	
Amperes	R.P.M.
8	1050
12-14	1600

Generator brush tension should be 1¼ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Relay is mounted on the generator. Relay contacts close at 8-10 M.P.H. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-3 amperes.

LIGHTING.—Head lamps are 6-8 volt, 21 cp. D. C., using double filament for dimming. Auxiliary head lamps are 6-8 volt, 4 cp. S. C. Quarter lamps used on closed models only are 6-8 volt, 21 cp. D. C. Stop lamp and inspection lamp are each 6-8 volt, 21 cp. S. C. Dash and tail lamps are each 6-8 volt, 2 cp. S. C.

Switches.—Lighting switch mounted on steering column is Model 1283. Ignition switch is Model 1293.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted on the back of the switch protects the lighting circuits. It begins to operate when the current flow reaches 25-30 amperes and continues with a current flow of 10-15 amperes.

WILLYS-KNIGHT

MODEL 70 (1926)

**AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION**

WILLYS-KNIGHT
Model 70 (1926)
Auto-Lite System

Plate No. 1184

BATTERY.—U. S. L., Type 3-HVX-7X. 6 volt. Starting capacity is 148.5 amperes for 20 minutes. Lighting capacity is 5 amperes for 28.4 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model IG-4065. Distributor Model IG-4107-B. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine, flat tungsten file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 20°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 20° at 2400 R.P.M. Total advance is 40° measured on engine flywheel.

Mounting.—Distributor is mounted at right front of engine. To remove, disconnect manual advance rod and remove two mounting screws. Then lift distributor from place.

Oiling.—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn every week or each 250 miles if the car is driven more than 250 miles in a week.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° or $51/64$ inch before top dead center as measured on the fly-wheel with the spark control lever in the fully advanced position. An allowable variation of 1° or $1/8$ inch is permitted. With timing correctly set, piston will be .026 inch before top dead center.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model ML-4106. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M., taking 180 amperes at 5.2 volts. Starter brush tension is $1\frac{1}{4}$ - $1\frac{1}{2}$ pounds each.

Starter Data

Torque		R.P.M.	Volts	Amperes	
0 lb. ft.	Free		5.5	45	(Without Bendix)
0 "	Free		5.5	50	(With Bendix)
1.1 "	1940		5.5	100	
4.3 "	1050		5	200	
7.8 "	650		4.5	300	
11.4 "	360		4	400	
16 "	Lock		3	560	

Mounting.—Starter is mounted at right of transmission at rear of flywheel housing by a barrel mounting. To remove starter, remove large pilot mounting screw and slide starter from place.

Oiling.—Put 7 or 8 drops of light engine oil in the oiler on the drive end of the starter every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. The commutator end bearing requires no attention.

GENERATOR.—Model GY-4103. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove the commutator cover band and shift third brush mounting bracket by tapping the third brush mounting stud with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting bracket is held in any desired position by the friction between the mounting stud and the generator end plate. Maximum charging rate is 15.5 amperes at 8 volts.

CADILLAC

MODEL 314 ENGINE NUMBERS 1-33001 TO 1-41001 (LATE 1926) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO SYSTEM

Plate No. 1185

BATTERY.—Exide, Type 3-LXRV-15-2G. 6 volt, 130 ampere hour. The starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2189. Distributor Model 5281. Breaker contacts separate .027 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The tension of the contact arm spring should be 16-20 ounces. Manual advance is 18-22°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 30° at 2800 R.P.M.

Mounting.—Distributor is mounted between the cylinder banks and is driven by spiral gears from the cam shaft. To remove unit, remove hold down screw and lift from position.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—The distributor has a mark "A" stamped on the flange of the lower housing to distinguish it from the earlier models. One set of breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position at which the flywheel marking "IG/A-1-5" is opposite the indicator on the flywheel case. This point is 1 3/16 inches on the flywheel before top dead center. The manual advance lever must be in the fully advanced position. The breaker system uses two sets of contacts opening alternately at intervals of 45° or 90° of crankshaft travel. The second set of contacts open when the flywheel marking "IG/A-2-6" is opposite the indicator on the flywheel housing.

Firing Order.—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R.

Spark Plugs.—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .032 inch.

STARTER.—Model No. 314. Starter is connected to the engine through a pinion shift incorporated in the starting pedal. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 104 R.P.M. taking 140-150 amperes. Starter brush tension should be 2 1/4-2 1/2 pounds each.

Torque		Starter Data.	
0 lb. ft.	18.25 "	R.P.M.	Volts
		Free.	6.
		Lock.	3.2

Mounting.—Starter is mounted vertically at the rear of the engine. To remove, loosen set screw in steering column plate. Remove starting pedal button and accelerator pedal. Then remove toe boards and disconnect hand throttle rod and foot throttle rod. Remove three hold down screws and lift starter from place.

Oiling.—Self-lubricating bearings are used. They require no attention.

GENERATOR.—Model No. 315. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, shift the third brush mounting plate by turning the hexagonal nut on the outside of the generator end plate. Turning the nut in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum output is 15-17 amperes reached at 1000 R.P.M. of the generator armature.

CADILLAC **MODEL 314 ENGINE NUMBERS 1-33001 TO 1-41001 (LATE 1926)** **DELCO GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO SYSTEM**

Continued from preceding page.

The brush tension should be 1-1¼ pounds each. Shunt field current is 3 amperes at 7.5 volts.

Mounting.—Generator is mounted at the front of the engine between the cylinder banks and is belt driven. Care must be taken to see that the belt is not tight enough to crowd the generator bearings nor so loose that excessive slipping is possible. To remove generator, loosen the four mounting nuts at the forward end of the generator and lower the unit so that the belt can be removed. Then remove nuts and lift generator from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay contacts close at 10-12 M.P.H. when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0.3 amperes. Air gap between relay armature and coil core is .009-.010 inch, contacts closed.

LIGHTING.—Switch Model 1303. Head lamps use a double filament bulb. They are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 3 cp. S. C. Dash, dome, tonneau and tail lamps are 6-8 volt, 3 cp. S. C. Backing and stop lamps are 6-8 volt, 21 cp. S. C.

CIRCUIT BREAKER.—Model 5767. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. A current of 25-30 amperes causes it to operate. While vibrating the current flow is 10-15 amperes. The lockout circuit breaker protects the horn, inspection lamp, stop and backing lamp and cigar lighter circuits. A current of 25-30 amperes causes it to open the circuit. While operating the current flow is less than 1 ampere.

Plate No. 1186

BATTERY.—Westinghouse, Type 6-OB-13. 6 volt, 115 ampere hour. The starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 19 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Type N-3. Distributor Type L. A. Breaker contacts separate .015 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance is 24°.

Oiling.—Fill the oil cup under the distributor head with light cylinder oil every two weeks or each 500 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber block on the breaker arm every month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 11° 28' after top dead center with the manual spark control lever and breaker assembly in the fully retarded position. This position is approximately 13/8 inches past top dead center, measure on the flywheel. With piston No. 1 entering power stroke the flywheel marking "EXCL.1-6" will be approximately opposite the indicator.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plugs are 7/8 S.A.E. Standard. Gaps are .025 inch.

STARTER.—Model 713-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M. taking 125 amperes. Starter brush tension is 24-28 ounces each. Starter switch is Model 404-L.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.6	475

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every two weeks or each 500 miles.

GENERATOR.—Model 941-P. (On Model 6-65) Model 917-ZA. (Model 6-75).—The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, remove the commutator cover band and loosen the small screw on the generator end plate holding the third brush mounting plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. There is a thermostat in the shunt field circuit. The thermostat contacts open at approximately 165° F. and reduce the output 40-50%.

Generator Data Model 941-P

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

21	8.5	1450			

Generator Data Model 917-ZA

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	850	12	7.65	2000
20	8.4	1900			

Motoring freely, generator draws 5 amperes at 6 volts. The shunt field current is 5 amperes at 6 volts. Brush tension is 24-28 ounces on the Model 941-P and 22-28 ounces on the Model 917-ZA generator.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Model 265-B. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. of the generator when the voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2-3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Remy Switch Model 420-F. Head and stop lamps are 6-8 volt, 21 cp. S. C. Side lamps are 6-8 volt, 3 cp. S. C. Dash lamp is 6-8 volt, 2 cp. D. C. Tail lamp is 6-8 volt, 2 cp. S. C.

FUSES.—Generator field fuse is 6 amperes on the Model 941-P generator and 5 amperes on the Model 917-ZA generator. Lighting fuses on switch are 10 amperes.

JEWETT
Model 6-45 (1926)
Remy System

Plate No. 1187

JEWETT

“NEW-DAY” MODEL 6-45 (1926) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY.—Westinghouse, Type 6-OB-13. 6 volt, 115 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 19 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 525-A. Distributor Model 637-A. Breaker contacts separate .025 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance is 20°. The tension of the breaker arm spring is 15-20 ounces. The stationary contact is mounted on a special crescent-shaped arm which moves in same arc as the breaker arm. To adjust contacts, loosen the screw holding the contact mounting arm and turn eccentric adjusting screw until desired contact opening is secured. Then tighten the mounting screw to hold adjustment.

Oiling.—Refill the grease cup under the distributor head and turn down two turns each month or each 1000 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper every month.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position at which the marking “10-1-6” on the flywheel is 1½ inches past the indicator on the flywheel housing. This position is 11° 21' after top dead center. The manual spark control lever and breaker assembly must be in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plugs are 7/8 S.A.E. Standard. Gaps are .030 inch.

STARTER.—Model 711-E. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 175 amperes. Starter brush tension is 20-28 ounces. Starter switch is Model 404-U.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	5	70
10 "	Lock	3.7	450

Mounting.—Starter is mounted at right of engine by a modified S.A.E. No. 2 flange mounting. To remove starter, remove three mounting screws and slide starter from place.

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every month or each 1000 miles.

GENERATOR.—Model 943-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, loosen the small round headed screw on the generator end plate and shift the third brush mounting bracket by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 17 amperes is reached at 1600 R.P.M.

Generator Data

Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
7	7-7.3	850			
17	8	1600	11-13	7.7	1800
11		2500			

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 4-6 amperes at 6 volts. Generator brush tension is 16-18 ounces.

Mounting.—Generator is mounted at right front of engine by special mounting.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Remy Lighting Switch Model 420-F. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Side lamps are 6-8 volt, 3 cp. S. C. Dash lamp is 6-8 volt, 2 cp. D. C. Tail lamp is 6-8 volt, 2 cp. S. C.

FUSES.—Generator field fuse is 6 amperes. Lighting fuse is 20 amperes.

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM. ATWATER KENT IGNITION.

FRANKLIN
Series 11-B (1927)
Atwater Kent Ignition
Owen Dyneto System

Plate No. 1188

BATTERY:—Willard, Type CRR-19. 6 volt. Starting capacity is 146 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded. Battery is mounted under the right front seat.

IGNITION:—Coil Model N-7, Distributor Model RA. Breaker contacts separate .015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone.

Mounting:—Ignition coil and distributor are mounted at right of engine on the bearing cap. To remove distributor, disconnect breaker lead and manual advance rod and remove distributor head or disconnect spark plug cables. Then remove cap screws holding bearing cap and lift the distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil on the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month. Also place a small bit of vaseline on the face of the interrupter cam, applying with a toothpick.

Timing:—Breaker contacts are fully open when piston No. 1 entering power stroke is $\frac{3}{4}$ inch before top dead center when the mark 1-6 on the clutch ring is $\frac{3}{4}$ inch before the top dead center mark. The spark control level must be in the fully advanced position. At this point the triangular mark on the fan wheel rim will be $\frac{3}{4}$ inch to the right of or before the center line on the fanwheel housing.

Valve Timing:—INLET VALVES:—Head diameter, $1\frac{1}{2}$ inches; stem diameter, .3373 inch; stem length, $4\frac{27}{32}$ inches; tappet clearance, .010 inch cold; spring pressure, 30 pounds; valve lift, $11\frac{1}{32}$ inch; intake opens at top dead center and closes 57° after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{1}{2}$ inches; stem diameter, .3373 inch; stem length, $4\frac{27}{32}$ inches; tappet clearance, .010 cold; spring pressure, 30 pounds; valve lift, $5\frac{1}{16}$ inch; exhaust opens $43\frac{1}{2}^\circ$ before lower dead center and closes 25° after top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .031 inch.

STARTER:—Model DH. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125 R.P.M., drawing 155 amperes at 5.5 volts.

Starter Data

Torque	R.P.M.	Volts	R.P.M.
0 lb. ft.	2400	5.8	80
2.3 "	1000	5.4	170
5. "	690	5.1	225
11. "	400	4.3	390
24.7 "	Lock	3.7	630

Mounting:—Starter is mounted at right of engine. To remove starter, disconnect starter cable and remove three mounting cap screws. Then lift starter from place.

Oiling:—Starter bearings are of the oilless type. They require no attention. Refill the oiler on the Bendix gear case with the pressure gun every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

GENERATOR:—Model CG-697. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system operating in conjunction with a compensating shunt field. Two shunt fields are used each being wound on two field poles. The light shunt field is connected between one main brush and the third brush; the battery being connected to these same brushes. The heavy shunt field is connected between the third brush and the other main brush. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

FRANKLIN
SERIES 11-B (1927)—(AFTER DECEMBER 7, 1926)
SERIAL NOS. 164801
OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.
ATWATER KENT IGNITION.

Continued from preceding page.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.3	410			
8.6	7.5	600			
14.4	8.0	1000	12	8	800
11.2	8.1	2000			
9.6	8.0	3200			

To adjust the generator output, loosen the screw in the center of the knurled nut on the generator end plate and turn the nut clockwise to increase the charging rate and counter-clockwise to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it must not be run in this condition. Two brushes must be raised and any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R. P. M. but does not exceed the peak output, the heavy shunt field is probably shorted.

Mounting:—Generator is flange mounted at right of engine to the rear of the timing chain case. To remove generator, loosen locknut on adjusting screw at rear of generator and turn adjusting screw in several turns. Then remove flange mounting cap screws and pry generator to the rear. Lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Relay contacts close at 410 R.P.M. of the armature when the voltage of the generator reaches 6.5 volts and open at 370 R.P.M. with a discharge current of 0-2 amperes. Contacts separate .025 to .040 inch. Air gap between the relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Connecticut Switch Model 194-Y. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament for dimming. Parking lamps are 6-8 volt, 2 cp. S.C. Stop and extension lamps are each 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 4 cp. S.C. Dash and tail lamps are in series. They are each 3-4 volt, 2 cp. S.C.

FUSES:—Cigar lighter fuse is 10 amperes, and is mounted on the side of the cigar lighter reel case. All lighting fuses are 20 amperes.

Plate No. 1188

CASE

MODEL J. I. C. (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Willard, Type SJRG-4. 6 volt, 105 ampere hour. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine jeweler's file. Automatic advance begins at 550 R.P.M. and reaches a maximum of 17-21° at 2000 R.P.M. Manual advance is 30°. The tension of the breaker arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then remove distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil into the distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this attention must be given every 500 miles. Every 1000 miles put a small amount of medium heavy cup grease on the surface of the breaker cam and polish the distributor head with a soft clean cloth.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, spark control lever and breaker assembly fully retarded. Locate the breaker cam carefully, so that when the backlash in the distributor gears is rocked forward the contacts will open, and when the backlash in the gears is rocked backward the contacts will just close. The distributor shaft rotates clockwise when viewed from the top.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, .372 inch; stem length, 5 5/8 inches from bottom of seat; tappet clearance, .004 inch cold; spring pressure, 55 pounds; valve lift, .3125 inch; intake opens 12° after top dead center and closes 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, .372 inch; stem length, 5 5/8 inches from bottom of seat; tappet clearance, .006 inch cold; spring pressure, 55 pounds; valve lift, .3125 inch; exhaust opens 40° before lower dead center and closes 8° after top dead center. The guide stems are removable. No oversize valve stems are made. A variance of .005 inch is allowed in stem diameter.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 181. The direction of rotation is clockwise, looking at the commutator end. The starter is connected to the engine through a Bendix drive. Starter cranks the engine at 110 R.P.M. taking 275 amperes at 4 volts.

Starter Data

Torque.	R.P.M.	Volts.	Amperes.
0 lb. ft.	4000	6	36
27 lb. ft.	Lock.	2.75	500

Starter brush tension should be 2 1/4 to 2 3/4 pounds each.

Mounting.—Starter is mounted at right of engine by a sleeve mounting. To remove starter, remove large pilot mounting screw and slide starter to rear and out.

Oiling.—Put 8 or 10 drops of light engine oil into each starter oiler every two weeks. Saturate the wick oiler in the Bendix gear case with light engine oil once each year. Every six months remove the grease plug and repack the reduction gear case with medium heavy cup grease.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To increase the charging rate, move the third brush in the direction of rotation (counter-clockwise) and move the same in the opposite direction (clockwise) to decrease the charging rate. The maximum charging rate is 15-17 amperes, reached at 1600-1800 R.P.M. of the armature or 22-27 miles per hour. The main brush tension should be 25-30 ounces and the third brush tension, 20-30 ounces.

Continued on reverse side.

CASE
MODEL J. I. C. (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page

Amperes	Generator Test Data Volts	R.P.M.
0 (Cuts in).....	7-7.5.....	650
4.5		800
13-17 (Max.).....		1600
9-12		2300

Generator motoring freely takes a current of 4 amperes, at 6 volts, at armature speed of 450 R.P.M. The field draws a current of 3 amperes, at 5 volts.

Mounting.—Generator is mounted at right of engine. To remove, disconnect generator drive coupling and remove four hold down screws. Then lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at approximately 8-9 M.P.H. or 650 R.P.M. of armature, and opens at approximately 550-600 R.P.M. of armature or 6-8 M.P.H., with a current discharge of 0-3 amperes. The contact gap separates .046-.062 inch. The air gap between relay armature and coil core is .025-.035 inch, contacts fully closed.

LIGHTING:—Delco Combination Switch Model 1260. Head and stop lamps are 6-8 volt, 21 cp. S.C. Dash, tail and side lamps are 6-8 volt, 2 cp. S.C. Tonneau and dome lamps are 6-8 volt, 2 cp. D.C.

CIRCUIT BREAKER.—A circuit breaker is used in the place of fuses. Circuit breaker will operate with a current of 25-30 amperes, and will continue to operate with a current flow not exceeding 15 amperes.

CASE

MODEL Y (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

CASE

Model Y (1927)

Delco-Remy System

Plate No. 1190

BATTERY.—Willard, Type SJRR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Model 5251. Breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. Manual advance is 38°. Automatic advance begins at 450 R.P.M. and reaches a maximum of 24-28° at 2000 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting.—Distributor is mounted at left of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Wipe out the distributor head with a small quantity of grease, removing all excess, and put a small bit of grease on the face of the breaker cam every month or each 1000 miles.

Timing.—Breaker cams begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever and breaker assembly in the fully retarded position. To set timing, loosen the screw in the center of the breaker cam and turn the cam until the contacts begin to separate. Then tighten the screw. Make certain that the rotor is under the segment connected to the cylinder entering power stroke.

Valve Timing:—INLET VALVES:—Head diameter, 1 15/16 inches; stem diameter, .372 inch; stem length, 6 1/2 inches from bottom of seat; tappet clearance, .004 inch cold; spring pressure, 77 pounds; valve lift, .3125 inch; intake opens 12° after top dead center and closes 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/16 inches; stem diameter, .372 inch; stem length, 6 1/2 inches from bottom of seat; tappet clearance, .006 inch cold; spring pressure, 77 pounds; valve lift, .3125 inch; exhaust opens 40° before lower dead center and closes 8° after top dead center. The guide stems are removable. No oversize valve stems are made. A variance of .005 inch is allowed in stem diameter.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 208. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 110 R.P.M. taking a current of 300 amperes. Starter brush tension is 2 1/4-2 3/4 pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	36
27 lb. ft.	Lock	2.75	—

Mounting.—Starter is sleeve mounted at right of engine. To remove starter, remove large pilot mounting screw and slide starter forward. Then lift from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Saturate the wick in the oiler at the end of the starter gear case every year. Remove the grease plug and repack the reduction gear case with medium heavy cup grease every six months.

GENERATOR.—Model 256. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the generator output, loosen the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers.

Continued on reverse side.

CASE
MODEL Y (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

Generator Data		
Amperes		R.P.M.
5		700
17		1800

The generator brush spring tension should be $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Mounting.—Generator is mounted at left of engine. To remove generator, remove four hold down screws and lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0-3 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING.—Switch Model 1257. Head and stop lamps are each 6-8 volt, 21 cp. S.C. Dome and pillar lamps are 6-8 volt, 4 cp. D.C. Dash, tail and tonneau lamps are 6-8 volt, 2 cp. S.C.

CIRCUIT BREAKER.—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this device to vibrate. While operating the current is 10-15 amperes.

FORD

MODEL "T" (1927)

FORD GENERATING, STARTING AND LIGHTING SYSTEM FORD IGNITION

BATTERY:—Ford. 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. Battery is mounted on the left frame member under the floor boards.

IGNITION:—The magneto is carried in the flywheel housing. There should be a clearance of .031 inch, between the coil cores and the magnet pole pieces. The magneto delivers alternating current to four vibrator ignition coils, one connected to each spark plug, as the timer closes the circuit in the proper sequence. When the vibrator arm is held down, the contacts should separate .030 inch. If the contacts are badly burned or pitted, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Coils should be adjusted to draw 1.3 amperes at 6 volts.

Mounting:—Timer or commutator is mounted at front of engine on the forward end of the cam shaft. It is held in place by the commutator spring, a flat piece of metal bolted to the oil filler.

Oiling:—Put several drops of light engine oil in the spring oiler of the timer every two weeks. In cold weather a mixture of 1/4 kerosene and 3/4 light engine oil should be used.

Timing:—Timer roller should just make connection with segment connected to Number 1 coil when the piston in Number 1 cylinder is on top dead center of the power stroke, spark control lever and timer assembly in the fully retarded position. Number 1 coil is nearest the front of the engine and number 1 segment is the upper left hand terminal viewing timer from the front. Intake closes when piston is 3 1/8 inches below face of cylinder block on compression stroke. Exhaust opens when piston is 3 3/8 inches below face of cylinder block on power stroke.

Valve Timing:—**INLET VALVES:**—Head diameter, 1 15/32 inches; stem diameter, .3105 to .312 inch; stem length, 4.974 inches; tappet clearance, 1/32 to 1/64 inch; spring pressure, 30 to 34 pounds (open); valve lift, .225 inch; intake opens at 1/16 inch after top dead center and closes 9/16 inch past lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/32 inches; stem diameter, .3105 to .312 inch; stem length, 4.974 inches; tappet clearance, 1/32 inch to 1/64 inch; spring pressure, 30 to 34 pounds (open); valve lift, .225 inch; exhaust opens 5/16 inch before lower dead center and closes at top dead center. The guide stems are not removable. Oversize valve stems are made. A variance of .312 inch is allowed in stem diameter.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plug Gaps.—The spark plug gaps are .030 to .032 inch.

STARTER.—Type F.A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 500 R.P.M., taking 200 amperes at 3.4 volts. Starter brush tension is 1 1/4-1 3/4 pounds for 50° to 70° deflection.

Starter Data.—F.A.

Torque	R.P.M.	Volts	Amperes
1 lb. ft.	2500	5.5	125
5 lb. ft.	1050	4.4	330
9 lb. ft.	425	3.6	465
13 lb. ft.	Lock	3.0	580

Mounting:—Starter is mounted at left of engine on forward side of transmission case. To remove starter, remove four small screws holding Bendix drive cover at rear of transmission case. Remove cover and withdraw Bendix drive assembly after backing out set screw in end of starter shaft. Then remove four flange mounting screws holding starter on forward side of transmission case and slide starter forward. Starter can then be lifted from place.

Oiling.—Starter requires no oiling.

FORD GENERATING, STARTING AND LIGHTING SYSTEM
FORD IGNITION

Continued from preceding page

GENERATOR.—Type F A. Generator current regulation is by the third brush system. Direction of rotation is counter-clockwise, looking at the commutator end. Charging rate is varied by adjustment of the third brush setting. Loosen the clamp nut holding the third brush holder. Move third brush in the direction of armature rotation to increase the charging rate, or in the opposite direction to decrease the charging rate. Clamp the third brush after position adjustment. The generator fields draw 2.4 amperes at 6 volts.

Generator Data.—F.A.

Amperes	Volts	R.P.M.
4.1	6.6	800
9.0	7.4	1100
11.5	7.9	1400
12.5	8.2	1700
11.0	8.1	2000

Generator motoring freely takes a current of 3 amperes at 6 volts. The generator brush tension is $2\frac{1}{2}$ to 3 pounds for 50° to 70° deflection.

Mounting:—Generator is flange mounted at right of engine at the rear of the gear case. To remove generator, back out four flange mounting screws. Then pry generator to rear and lift from place.

Oiling.—Put 4 or 5 drops of light engine oil in the rear generator bearing oiler every two weeks. If the car is driven more than 500 miles in 2 weeks, the oiling must be done every 500 miles.

RELAY.—Relay is mounted on the generator frame. Relay closes at 600-650 R.P.M. of armature or 8-10 miles per hour, and opens at 550-600 R.P.M. of armature or 6-8 miles per hour, the discharge current being 0-2 amperes. Relay contacts separate .032 inch. If badly burned or pitted resurface with worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LIGHTING:—Ford Lighting Switch. Head lamps are 6-8 volt, 21 and 2 cp. D.C. Double filament using the 2 cp. filament for dimming. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

Delco-Remy System

Plate No. 1192

BATTERY.—Exide Type 3-LXR-15-2. 6 volt, 130 ampere hour. The starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2159. Distributor Model 5226. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. A manual advance of 18-23° is provided. Automatic advance begins at 900 R.P.M. and reaches a maximum of 24-28° at 3000 R.P.M. The tension of move three hold down nuts and lift distributor upward and out from position.

Oiling.—Put 3 or 4 drops of light engine oil in the oiler on the side of the distributor housing every 250 miles. Remove the grease plug and pack the gear case with light cup grease to a level just below the cover plate (located on the front of the unit near the spark control lever) every 5,000 miles. Place a small amount of vaseline or heavy grease on the face of the breaker cam and in the distributor head every 1,000 miles. Remove all excess and polish the rotor track with a soft clean cloth.

Mounting.—Distributor is mounted at the forward end of the engine. To remove, remove four hold down screws and lift distributor upward and out from position.

Timing.—Right hand breaker contacts begin to separate when piston No. 1R on compression stroke reaches a position at which the vertical mark preceding the marking "RET" on the clutch ring is opposite the indicator with the spark control lever in the fully retarded position. This breaker controls the right hand coil and fires 4 cylinders. The left hand breaker controls the other coil and fires the remaining cylinders. The engine fires at intervals of 60° and 120° corresponding to 30° and 60° of distributor travel. These intervals must be accurately located. It may be done by connecting a test lamp in each circuit and noting the exact instant the contacts separate. Small marks may be scratched on the edge of the housing opposite the rotor when the contacts separate. These should measure 1 1/16" for the 30° and 2 1/32" for the 60° intervals.

Valve Timing.—INLET VALVES:—Head diameter, 1 3/4 inches; stem diameter, 3/8 inch; stem length, 6 3/4 inches; tappet clearance, .004 inch cold; spring pressure, 85 pounds; valve lift, 5/16 inch; intake opens 2 1/2° before top dead center and closes 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/4 inches; stem diameter, 3/8 inch; stem length, 6 3/4 inches; tappet clearance, .004 inch cold; spring pressure, 85 pounds; valve lift, 5/16 inch; intake opens 48° before lower dead center, and closes at top dead center. The guide stems are removable. No oversize valves are made.

Firing Order.—The firing order is 1R-4L-2R-3L-4R-1L-3R-2L.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .020-.025 inch.

STARTER-GENERATOR.—Model 193. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Depressing the starter pedal meshes the gears, opens the generator circuit and brings the starter brushes in contact with the commutator, allowing it to crank the engine. When the pedal is released, a spring reverses these operations. Two overrunning clutches permit the high speed necessary in cranking the engine and prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the starter commutator end; starter brush tension should be 2 1/4-2 3/4 pounds.

1927

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR.—Generator current regulation is by the third brush system. To adjust charging rate, loosen cover band on the generator end (front) of unit, exposing the brush regulating lever. Raising the lever increases the charging rate; lowering it decreases the charging rate. Replace the cover band after adjusting. A thermostat mounted with third brush opens at 195-200° F. cutting down the output 30%. The brush tension should be $1\frac{1}{2}$ - $1\frac{3}{4}$ pounds each.

Generator Data.

Amperes	R.P.M.
3.....	600
16-18.....	1400

Mounting.—Starter-generator is mounted at right of engine. To remove, drain radiator, disconnect pump shaft, and remove drip pan under starter-generator. Then remove all pump bolts and drop pump down past engine. Remove two cap screws extending through to back of crank case arm holding starter-generator to engine and remove unit by slipping it down past the engine.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Once each year, remove, disassemble and clean motor and generator clutches. Repack with vaseline.

RELAY.—No relay is used. Generator is connected to the battery through the ignition switch.

LIGHTING:—Switch Model 1236. Head lamps are 6-8 volt, 21 cp. double filament. Dimmer lamps are 6-8 volt, 6 cp. S.C. Dash and tail lamps are 6-8 volt, 2 cp. S.C. Stop and backing lamps are 6-8 volt, 21 cp. S.C.

CIRCUIT BREAKER.—Model 5742. Two circuit breakers are mounted on the rear of the dash. A vibrating circuit breaker opens when the current flow reaches 25-30 amperes and continues with a flow of 10-15 amperes. A lock out circuit breaker operates when the current flow reaches 25-30 amperes and continues with less than 1 ampere.

MODEL M48 (1927)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Prest-O-Lite, Type 12-11-SHC. 12 volt, 92.5 ampere hour. The positive (+) terminal is grounded.

IGNITION.—Coil Model No. 2135. Distributor Model No. 5258. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface with a fine, flat jeweler's file or on a medium hard oilstone. Manual advance is 24-29°. Automatic advance starts at 600 R.P.M. and reaches a maximum of 15-18° at 2000 R.P.M. The tension of the contact arm spring should be 16-20 ounces.

Mounting.—Distributor is mounted on left side of motor. To remove, first remove bracket bolts then take distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the oilers on the side of the distributor housing every 1000 miles. Remove the plug and fill gear compartment with very light gear grease to the level of the lower side of the horizontal shaft each six months. Put a small bit of vaseline on the breaker cam and wipe out the distributor head with a small bit of vaseline, removing all excess, every 1000 miles.

Timing.—Breaker contacts in the ignition circuit firing the plugs over the intake valves (rear distributor) begin to separate when the piston reaches a position 1/16 inch past top dead center entering power stroke with the spark control lever and breaker assembly in the fully retarded position. This position is approximately 1 1/2 inches past top dead center measured on the flywheel. Breaker contacts firing plugs over the exhaust valves open approximately 3-7° earlier than this.

Valve Timing.—INLET VALVES:—Head diameter, 2 5/16 inches; stem diameter, .4345 inch; stem length, 8 1/2 inches; tappet clearance, .002 inch; spring pressure, 120 pounds; valve lift, .4078 inch; intake opens 20° before top dead center and closes 70° after lower dead center.

EXHAUST VALVES:—Head diameter, 2 5/16 inches; stem diameter, .4345 inch; stem length, 8 1/2 inches; tappet clearance, .002 inch; spring pressure, 120 pounds; valve lift, .4078 inch; exhaust opens 57° before lower dead center, and closes 21° after top dead center. The guide stems are removable. Oversize guide valve stems are made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027 inch.

STARTER.—Frame No. 779. Starter is connected to the engine through a magnetically operated pinion shift. The direction of rotation is counter-clockwise looking at the commutator end. Pinion should be pulled into mesh in 10% of one revolution with a current of 125 amperes and must not be held in by a current of 65 amperes.

Starter Data.

Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	Free.	5.5	65
3.5 "	2400	10.5	210
28.5 "	Lock.	6.0	750

The starter brush pressure should be 2.5 to 3 pounds each.

Mounting.—Starter is mounted on left side of motor. To remove, remove bracket and clamping bolts and slip starter out of bracket.

Oiling.—Put 4 or 5 drops of light engine oil in each of the oilers every 500 miles.

GENERATOR.—Frame No. 787-R. The direction of rotation is clockwise looking at the commutator end. Generator regulation is by an automatic voltage regulator. To increase generator output increase regulator voltage by turning the regulator adjusting screw in a clockwise direction. The maximum generator output is 13 amperes reached at 1250 R.P.M. of the generator armature.

Generator Data.

Amperes.	Volts.	R.P.M.	Field Amperes
0	13	450	1.8
4	13	500	1.6
10	13	800	1.4
10	13	1250	1.35

MODEL M48 (1927)
WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

Motoring freely the generator draws 5 amperes at 12 volts. The field draws 1.5 amperes at 12 volts.

Mounting:—Generator is mounted on right side of motor. To remove, loosen strap.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY-REGULATOR:—Westinghouse Type 322873-3. Relay contacts close at 450 R.P.M. of the generator when the voltage reaches 12.4 volts, and open with a discharge current of 0 to 3 amperes. Set regulator contacts at 1250 R.P.M. of the generator with an output of 10 amperes at 13 volts. Relay air gap is .055-.060 inch. Regulator air gap is .055 inch. Center gap is .015 inch.

LIGHTING:—Bryant Electric Co. four-button gang switch Model B2462 L. Mounted on the dash. Head and stop lamps are 12-16 volt, 21 cp. S.C. Dash, tonneau, side, step and tail lamps are each 12-16 volt, 2 cp. S.C. Dome lamp is 12-16 volt, 4 cp. Dimmer switch is model 2440. With dimmer resistance head lamps are 2 cp.

FUSES:—Ignition fuse is 20 amperes. All other fuses are 10 ampere.

LOCOMOBILE

MODEL 90 (1927); SERIAL NOS. 33-101

DEJON GENERATING, STARTING AND LIGHTING SYSTEM DEJON IGNITION

BATTERY.—U. S. L. Type 3-HVX-8Z. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 33 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CA-04. Distributor Model IA-4007. Breaker contacts separate .018-.020 inch. Resurface contacts in a medium hard oilstone or with a fine, flat tungsten contact file. Ignition current is 6.3-6.5 amperes at 6 volts reducing to 3.5-3.6 amperes when the ballast coil becomes heated. Distributor is of the semi-automatic type. Manual advance is 6°. Automatic advance begins at 200 R.P.M. (distributor) and reaches a maximum of 12.5° (distributor) at 1200 R.P.M. or 2400 R.P.M. of the crankshaft. Condenser is mounted in distributor housing and has a capacity of .20-.25 microfarads. When tested without ballast resistor, coil draws 11 amperes (cold) and 6.75 amperes (hot) at 6 volts. On bench test maximum spark gap between needle points at atmospheric pressure is .394 inch with distributor R.P.M. of 1000.

Mounting:—Distributor is mounted on right hand side of engine on top of cylinder head.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 500 miles if the car is driven more than 500 miles in a week.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, crank engine until piston on compression stroke (piston coming up—both valves closed) reaches top dead center. Then loosen tapered screw in center of cam and turn cam on shaft until breaker contacts begin to separate. Tighten the screw. Make certain that cam is replaced with arrow pointing in direction of rotation (clockwise.)

Valve Timing:—INLET VALVES:—Head diameter, 1 15/16 inches; stem diameter, .3725 inch; stem length, 7 1/8 inches; tappet clearance, .003 inch; spring pressure, 95 pounds; valve lift, .3812 inch; intake opens at top dead center and closes 50° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/16 inches; stem diameter, .3725 inch; stem length, 7 1/8 inches; tappet clearance, .003 inch; spring pressure, 95 pounds; exhaust opens 40° before lower dead center and closes 20° after top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .018 inch.

STARTER.—Model SB-4001. Starter is connected to the engine through an Eclipse manual shift Type E. S. 1. The direction of rotation is clockwise, looking at the commutator end.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5	40
1.2 "	2200	5.5	100
4.1 "	1150	5	200
7.3 "	760	4.5	300
10.5 "	500	4	400
28.4 "	Lock	4	930

Mounting:—Starter is mounted on right hand side of engine. To remove starter, remove the bolts at the end of starter.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model DD-4001. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, shift the third brush by turning the slotted third brush shifting shaft on the generator end plate above the bearing retainer. Insert a screw driver in the slot and turn the shaft to the left (counter-clockwise) to increase the charging rate and to the right or clockwise to decrease the charging rate. Maximum charging rate is 15.5 amperes (hot) reached at 1200 R.P.M. of the generator.

Continued on reverse side.

LOCOMOBILE

JUNIOR EIGHT (1927)

DEJON GENERATING, STARTING AND LIGHTING SYSTEM DEJON IGNITION

BATTERY.—U. S. L. Type 3-HVF-6X. 6 volt, 117 ampere hour. The starting capacity is 127 amperes for 20 minutes. Lighting capacity is 5 amperes for 23 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model CA-4008. Distributor Model IA-4008. Breaker contacts separate .018-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. Distributor has a manual advance of 10° and automatic advance of 15°. Automatic begins at 200 R.P.M. of the distributor and reaches a maximum of 15° at 1400 R.P.M. Condenser is mounted in the distributor housing and has a capacity of .20-.25 microfarads. The ignition coil draws 6.5 amperes cold at 6 volts reducing to 4-4.25 amperes within 30 seconds as the ballast resistor becomes heated. Tested without the ballast resistor, coil draws 12.5 amperes cold and 7.5 amperes hot. The maximum spark gap (between needle points and at atmospheric pressure) is .400 inch with a primary coil voltage of 6 volts and a distributor speed of 600-1600 R.P.M.

Mounting:—Coil is mounted on generator. Distributor is mounted on generator shaft housing every week or each 500 miles if the car is driven more than 500 miles

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles if the car is driven more than 250 miles in a week.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, loosen tapered screw in center of breaker cam and turn cam in a counter-clockwise direction until the contacts begin to separate. Then tighten the screw. The cam is of the reversible type and must be placed with the arrow pointing in the direction of rotation (clockwise). The breaker arm is fitted with a flexible pigtail which must be intact.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/32 inches; stem diameter, .330 inch; stem length, 4 63/64 inches; tappet clearance, .003 inch; spring pressure, 75 pounds; valve lift, .2735 inch; intake opens at top dead center and closes 36° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, .330 inch; stem length, 4 63/64 inches; tappet clearance, .003 inch; spring pressure, 75 pounds; valve lift, .2735 inch; exhaust opens 36° before lower dead center, and closes at top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .018 inch.

STARTER.—Model SA-4003. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starting switch is Model SW-4001.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.	40
.5 lb. ft.	2800	5.5	100
2.5 lb. ft.	1600	5.	200
4.7 lb. ft.	1000	4.5	300
7.3 lb. ft.	600	4.	400
20. lb. ft.	Lock	4.	800

Mounting:—Starter is mounted on left hand side of engine. To remove, first remove bolt from clamping strap, then pull starter from place.

Oiling.—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Continued on reverse side

LOCOMOBILE **JUNIOR EIGHT (1927)** **DEJON GENERATING, STARTING AND LIGHTING SYSTEM** **DEJON IGNITION**

Continued from preceding page

GENERATOR.—Model DA-4006. Generator is mounted at left of engine and is fitted with a distributor drive. The direction of rotation is clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, insert a screw driver in the slotted adjustment screw on the generator end plate and turn in a counter-clockwise direction to increase the charging rate and in a clockwise direction to decrease the charging rate. This screw turns the third brush mounting plate. With a maximum setting generator output is 16 amperes at 6 volts.

Generator Data.

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
0		480	0		500
1		500	2		600
5.5		600	7		800
11		800	10		1000
15		1200	11		1200
12		2400	9		2400
10		3200	7		3200

Shunt field current is 2.5 amperes at 6 volts. A five ampere fuse mounted on the generator end plate protects the field circuit.

Mounting:—Generator is mounted on left hand side of engine. To remove, first remove bolts at front end.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model RA-4001-H. Relay is mounted on the generator. Relay contacts close at 480-500 R.P.M. of the generator with a voltage of 7-7.5 volts and open with a discharge current of 0-2 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING.—Clum Switch. Head lamps and stop lamp are each 6-8 volt, 21 cp. S. C. Dimmer lamps are 6-8 volt, 3 cp. S. C. Dash, dome, side and tail lamps are each 6-8 volt, 3cp. S. C.

FUSES.—Generator field fuse is 5 amperes. Lighting fuse is 20 amperes.

Delco-Remy System

Plate No. 1196

BATTERY:—U.S.L. Type XY-13X. Starting capacity is 86 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat on the right hand side.

IGNITION:—Coil Model 525-A. Distributor Model 4017. Breaker contacts separate .015-.0225 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Distributor is of the full automatic type. Automatic advance begins at 600 R.P.M. and reaches a maximum of 23-27° at 1600 R.P.M. The tension of the breaker arm spring should be 13-16 ounces. The Ignition Switch is Model 1302.

Mounting:—Ignition coil is mounted on top of the generator. Distributor is mounted at commutator end of generator. To remove distributor, disconnect breaker lead and high tension lead from coil. Remove distributor head or disconnect spark plug leads. Then remove clamp screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm. Once every six months add medium cup grease to the gear compartment.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position. With piston No. 1 in this position the flywheel marking "DC" will be opposite the mark on the flywheel case.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 5 19/32 inches; tappet clearance, .004 inch; spring pressure, 53 pounds; valve lift, 5/16 inch; intake opens at 4° past top dead center, and closes at 46° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/16 inches; stem diameter, 3/8 inch; stem length, 5 19/32 inches; tappet clearance, .006 inch; spring pressure, 53 pounds; valve lift, 5/16 inch; exhaust opens 41° before lower dead center, and exhaust closes 1° past top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A. Standard. Gaps are .025 inch.

STARTER:—Model 714-E. Starter is connected to the engine through an outboard Bendix drive Type R-11-X. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24-28 ounces each. Starter switch is Model 1953.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is mounted in front of the flywheel on the right side of the engine. Mounting is by a No. 1 S.A.E. flange mounting. To remove starter, disconnect starter cable and remove three flange mounting bolts. Then slide starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is of the oilless type.

MOON

MODEL 6-60 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 940-C. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 162° F., cutting a resistance of .75 ohm into the shunt field circuit and reducing the output approximately 40 per cent. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Brush tension is 14-18 ounces.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	750			
19-21	8.5	1450	11	7.65	1900

Mounting:—Generator is mounted at the right of the engine to the rear of the chain case. To remove generator, disconnect generator lead and ignition leads and remove distributor head. Remove oil-filler, thus exposing front side of chain case and remove nut holding sprocket on generator shaft. Then loosen clamp adjusting screw on flange and remove two flange mounting screws. Then slide generator to rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end is oiled by the oil spray from the chain case.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 1-3 amperes. Contacts separate .015-.025 inch. Air gap between relay armature and coil core is .018-.022 inch, contacts closed.

LIGHTING:—Switch Model 1303. Head lamps are 6-8 volt, 21 cp. S.C. Dimming is by resistance on the switch. Side, dash, dome and tail lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the ignition switch. It protects the head, side and tail lamp circuits. A current of 25-30 amperes will cause this device to operate, limiting the current to 10-15 amperes.

ACCESSORIES:—A National Electric gasoline gauge is mounted on the dash.

SERIES A (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

MOON
Series A (1927)
Delco-Remy System

Plate No. 1197

BATTERY:—U.S.L. Type XY-13. 6 volt. The starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 5274. Breaker contacts separate .014 to .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone, or with a fine, flat jeweler's file. Manual advance provided is 30°. Automatic advance begins at 550 R.P.M. and reaches a maximum of 18-24° at 2000 R. P. M. The tension of the breaker arm spring should be 13- 16 ounces.

Mounting.—Distributor is mounted on generator at right of engine. To remove, remove manual advance lever stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles. Twice each year remove the grease plug on the side of the gear compartment and repack gears with medium heavy cup grease.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 5 9/32 inches; tappet clearance, .004 inch; spring pressure, 51 pounds; valve lift, 5/16 inch; intake opens at 4° past top dead center, and closes 46° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 5 9/32 inches; tappet clearance, .006 inch; spring pressure, 51 pounds; valve lift, 5/16 inch; exhaust opens 41° before lower dead center, and closes 1° past top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. 286. Starter is connected to the engine by means of a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
10 "	Lock	3.1	—

The starter brush tension should be 2 1/4 to 2 3/4 pounds each.

Mounting.—Starter is mounted at the right of the engine. To remove, remove three flange screws holding starter in position. Then pull unit forward and out.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 308. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by means of the third brush system in connection with a compensating field. Two field coils are connected between the third brush and the positive main brush. The other two coils are connected between the positive main brush and the negative main brush. To adjust the generator output, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the brush in the direction of armature rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers.

Generator Data.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page

The tension of the brushes should be $1\frac{1}{4}$ to $1\frac{1}{2}$ pounds each.

Mounting.—Generator is mounted at the right of the engine and is chain driven from the crankshaft. To remove generator, disconnect pump shaft coupling. Then remove round plate on front side of chain case and nut holding sprocket on generator shaft. Loosen clamp adjustment screw and remove two flange mounting screws. Then slide generator to rear and lift out.

Oiling.—Put 8 or 10 drops of light engine oil in each of the two generator oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts and open with a discharge current of 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and coil core is .015 to .020 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp.S.C. Side lamps are 6-8 volt, 2 cp.S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C.

SWITCHES.—Lighting switch is Model No. 1283. Ignition switch Model No. 1285. Starting switch is Model No. 1953.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted on the switch takes the place of fuses in the lighting circuits. A current of 25-30 amperes will start this device vibrating. While vibrating the current is 10-15 amperes.

MOON

LONDON MODEL (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY.—Exide, Type 3-XC-15-1, 6 volts, 100 ampere-hour capacity. The starting capacity is 114 amperes for 20 minutes. The lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2178. Distributor Model No. 5256. Breaker contacts separate .020-.0275 inch. They are made of tungsten. If the condition of the contact points affects the ignition, remove and resurface on a medium hard oilstone or with a fine flat jeweler's file. It is not necessary to grind the points if they are burned or pitted. Just brighten the surface of the point and remove the raised portion of the opposite point.

Mounting.—To remove distributor, remove manual advance lever stop screw and lift unit from position.

Oiling.—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once each season. Place a small bit of vaseline on the face of the breaker cam every 2000 miles.

Timing.—Breaker contacts just begin to separate when piston No. 1 is at top dead center on compression stroke, mark "UD" on flywheel opposite indicator in flywheel housing, spark control lever and breaker assembly in the fully retarded position. To set timing, loosen advance lever clamp screw and turn housing in a counter-clockwise direction until the contacts begin to separate. See that rotor is under contact which is connected to cylinder No. 1. Tighten clamp screw after making adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 5¾ inches; tappet clearance, .004 inch; valve lift, 5/16 inch; intake opens at 12° past top dead center, and closes 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 5¾ inches; tappet clearance, .006 inch; valve lift, 5/16 inch; exhaust opens 40° before lower dead center, and closes 8° past top dead center. No over-size valves are made.

Firing Order.—The firing order is 1, 5, 3, 6, 2, 4.

Spark Plugs.—The spark plug diameters are 7/8 inch, and the gaps are .030 inch.

STARTER.—Model No. 181. The starter is connected by a Bendix drive to the engine. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., and takes a current of 125-200 amperes at 5 volts.

Starter Test Data

Amperes	Volts	Torque	R.P.M.
40-50	5.5	Running Free	4500
450-550	2.75	27 lb. ft.	Lock

Mounting.—Starter is mounted at right of engine in a sleeve mounting. To remove starter, remove large hold-down screw and pull starter forward from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter oilers every 1000 miles or each month. Saturate the wick in the oiler on the Bendix gear case once each year. Remove grease plug and fill reduction gear case with medium heavy cup grease twice a year.

GENERATOR.—Model No. 258. The direction of rotation is counter-clockwise, looking at commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the cover band on the commutator end of generator housing, and by means of an extension handle, shift the third brush in the direction of rotation (counter-clockwise) to increase the charging rate. To decrease the charging rate, shift the third brush in the opposite direction (clockwise) of rotation. The third brush plate is held in any position by means of a friction clamp. The maximum charging rate is 14-16 amperes, reached at 1600 R.P.M. of armature.

MOON
LONDON MODEL (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page

Mounting.—Generator is mounted at left of engine. To remove generator, remove hold-down screws, disconnect coupling and lift unit from position.

Oiling.—Put 8 or 10 drops of light engine oil into each generator oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles.

RELAY.—Relay closes at 450-550 R.P.M. or 6-8 M.P.H., at 7 volts, and opens at 400-450 R.P.M., with a current discharge of 0-3 amperes. The contact gap is .025-.035 inch, contacts fully separated. The air gap is .025-.035 inch, with the contacts fully closed.

LIGHTING.—Combination Switch No. 1238 is used. Head lights are each 6-8 volts, 21 cp. Auxiliary headlights are each 6-8 volts, 4 cp. Tail and dash lights are each 6-8 volts, 2 cp. All the above lights are of the single contact type.

CIRCUIT BREAKER.—A circuit breaker is mounted on the back of the combination switch takes the place of fuses. A current flow of 25-30 amperes will cause the circuit breaker to operate, and will continue to operate with a current flow of not more than 15 amperes. Also not over 15 amperes must pass with a dead short circuit across the circuit breaker terminals.

DIANA

EIGHT (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—U. S. L. Type XY-15. 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor Models 5282 and 5287. Breaker contacts separate .025 inch. Resurface contacts on a medium hard oilstone. Manual advance is 40°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 18-24° at 2000 R.P.M. The tension of the contact arm spring should be 13-16 ounces.

Mounting.—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual advance control lever in the fully retarded position. This system uses two sets of contacts with a four-sided cam, the contacts opening alternately at intervals of 45° (distributor) corresponding to 90° of engine travel. Each breaker thus fires 4 cylinders. They must be set to open at exact points. To time engine, turn until flywheel marking DC/IEC is at indicator. Adjust stationary contacts so that they begin to separate. Tighten adjusting screw and turn engine over 90° until straight mark on flywheel is opposite indicator. Then adjust other set of contacts to just begin to separate. On Model 5282 this is done by loosening two hold-down screws and rotating the movable breaker plate. Tighten the two screws. On Model 5287, turn the eccentric adjusting screw which shifts one set of contacts on the plate.

Valve Timing.—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 9/16 inches; tappet clearance, .004 inch; spring pressure, 49 1/4 pounds; valve lift, 5/16 inch; intake opens 4° past top dead center, and closes 46° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 5 9/16 inches; tappet clearance, .006 inch; spring pressure, 49 1/4 pounds; valve lift, 5/16 inch; exhaust opens 41° before lower dead center, and closes 1° past top dead center.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 313. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 1/2 pounds each. Starter switch is Model 1953.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	50
13 lb. ft.	Lock	3.2	

Mounting.—Starter is mounted at right of engine. To remove, remove three flange mounting screws and lift starter to rear and out.

Oiling.—Starter bearings are self-oiling. They require no attention.

GENERATOR.—Model 325. The direction of generator rotation is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system combined with a stabilizing shunt field. The stabilizing field is a straight shunt field of comparatively small wire wound on two poles. It draws about 1 ampere at 6 volts. The third brush shunt field is wound on the other two field poles. To adjust the generator output remove the commutator cover band and shift the third brush mounting plate by the handle on the plate. Shifting the plate in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. It is held in any desired position by friction washers. Generator brush tension should be 1 1/4-1 1/2 pounds each.

Plate No. 1199A

AUBURN

MODEL 8-88 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U. S. L., Type XY-13 X 6. 6 volt. Starting capacity is 90 amperes for 20 minutes. Lighting capacity is 5 amperes for 17.4 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-A. Distributor Model 658-A. Breaker contacts separate .022 inch. They are made of tungsten. When the condition of the contacts affects the ignition, resurface on a medium hard oilstone or with a fine, flat jeweler's file. Distributor is of the manual and automatic type. Manual advance is 15°. Automatic advance is 15°, which starts at 300 R.P.M.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. Set timing with the mark on the flywheel opposite the rib in the chain case with the distributor fully retarded. The other set of contacts should open exactly 45° after this point. They may be checked by a special tool furnished by the manufacturer.

Firing Order.—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs.—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER.—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR:—Model 949-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. A thermostat located in the third brush circuit opens at 165° F. cutting a resistance into the shunt field and reducing the output approximately 50%. To adjust generator output loosen the small round headed screw on the outside of the generator end plate and shift the third brush mounting arm. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—Presto-O-Lite, Type 613JF, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17.5 hours. The positive (+) terminal is grounded. Battery is mounted under the driver's seat on the left side.

IGNITION:—Coil Model 525-C. Distributor Model 658-C. Breaker uses double contacts set at an angle of 45° and opening alternately. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Breaker arm spring tension should be 17-21 ounces. Distributor is of the semi-automatic type. Manual advance is 20°. Maximum automatic advance is 25°. Condenser is mounted in cylindrical cartridge under the distributor head.

Mounting:—Distributor is mounted on left side of engine block. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then remove special screw through slot in manual advance arm and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every month or each 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position five teeth before top dead center (as measured on the flywheel) with the manual advance lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the up-stroke of the piston with both valves closed. Fully advance the spark control lever and crank engine until a point on the flywheel five teeth ahead of the flywheel marking "TDC-1-8" is opposite the indicator on the flywheel case. Loosen the lock nut on the breaker cam and rotate the cam until one set of contacts mounted on the breaker plate begin to separate. Tighten the lock nut. The other set of contacts should open exactly 45° after this point. They may be checked by special tool furnished by manufacturer.

Valve Timing:—INLET VALVES—Head diameter, 1 3/16 inches; stem diameter 5/16 inch; stem length, 5 23/32 inches; tappet clearance, .007 inch; spring pressure, 70 pounds closed, 133 pounds open; valve lift, 21/64 inch; intake opens at 6° before top dead center and closes 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 inch; stem diameter 5/16 inch; stem length, 5 23/32 inches; tappet clearance, .007 inch; spring pressure, 70 pounds closed, 133 pounds open; valve lift, 21/64 inch; exhaust opens at 40° before lower dead center and closes at 6° after top dead center. The guide stems are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Caps are .020 inch.

STARTER:—Model 726-A. Starter is connected to the engine through a mechanical pinion shift and overrunning clutch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine. To remove starter disconnect starter cable and remove three flange mounting screws holding starter to housing. Then slide starter forward and lift from place.

Oiling:—Oilless bearings are used. They require no attention.

Continued on reverse side

LITTLE MARMON

MODEL "L" (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page

GENERATOR:—Model 949-F. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system in conjunction with a thermostat. Thermostat contacts open at 162°F cutting a resistance of .75 ohms into the shunt field circuit and reducing the output approximately 40 per cent. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate of 19-21 amperes (cold) is reached at 1450 R.P.M. of the generator armature or approximately 20 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Shuntfield current is 4 amperes at 6 volts. Generator brush spring tension should be 14-18 ounces each.

Mounting:—Generator is cradle mounted at left of engine. To remove generator, disconnect generator lead. Then remove bolt from rubber coupling and remove nut from clamp strap stud. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at approximately 10 M.P.H. when the voltage of the generator reaches 7-7.5 volts and opens at 8 M.P.H. with a discharge current of 0-2.5 amperes. Charging current is 2 amperes at closing of contacts. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Lighting switch is mounted on the lower end of the steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament for dimming. Stop and backing lamps are each 6-8 volt, 21 cp. S. C. Tonneau, cowl, dome and corner lamps are each 6-8 volt, 3 cp. D. C. Side, dash and tail lamps are each 6-8 volt, 3 cp. S. C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the cowl. It protects the lighting circuits. A current of 25-30 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

ACCESSORIES:—National gas gauge; Connecticut cigar lighter; National clock; Stewart vacuum gas pump.

MARMON

MODEL E-75 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY.—Prest-O-Lite, Type 617-SHK. 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 2178. Distributor No. 17047. Breaker contacts separate .020-.0275 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Double ignition is used. Two coils are used and each ignition circuit is electrically separated, although only one distributor is used. Each primary circuit is controlled by one breaker arm, both operating from a single cam. In setting breaker gaps, synchronize contacts so that they both open at the same instant. Distributor is of the semi-automatic type. Manual advance is 40°. Automatic advance begins at 550 R.P.M. and reaches a maximum of 22-26° at 2000 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting.—Distributor is mounted on the rear of the generator. To remove, remove distributor head and disconnect two primary leads and manual advance rod. Then remove hold down screw and lift unit from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Every six months repack the distributor gear compartment with medium heavy cup grease.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7 teeth before top dead center as measured on the flywheel with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen timing adjustment screw and turn cam until contacts begin to separate. Both contacts must separate at the same instant. Tighten the screw and replace rotor, making certain that rotor button is under the segments connected to the spark plugs in cylinder No. 1.

Valve Timing.—INLET VALVES:—Head diameter, 2 inches; stem diameter, .373 inches; tappet clearance, .007 inch; two springs combined pressure, 85-95 pounds closed, 135-145 pounds open; intake opens 13° past top dead center and closes 48° past lower dead center.

EXHAUST VALVES:—Head diameter, 2 inches; stem diameter, .372 inch; tappet clearance, .007 inch; two springs combined pressure, 85-95 pounds closed, 135-145 pounds open. Exhaust opens 38° before lower dead center and closes at 7° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—The spark plug diameters are 7/8-18 S. A. E. Gaps are .027-.032 inch.

STARTER.—Model 320. Starter is connected to the engine through a manually operated pinion shift incorporated in the starting switch. An over-running clutch is provided to prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
18.25 "	Lock	3.2	—

Mounting.—Starter is mounted at right of engine. To remove, disconnect pedal rod and return spring. Then remove two hold down screws and lift starter from place.

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model 319. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, remove the commutator cover band and shift the third brush mounting plate by prying on the handle on the plate. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. Generator brush tension is 1 1/4-1 3/4 pounds each.

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.

DELCO IGNITION.

BATTERY.—Prest-O-Lite, (Six) Type 613-SHK. 6 volt. 112.5 ampere hour. The starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. (Eight) Type 617-SHK. 6 volt. 160 ampere hour. The starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded.

IGNITION.—Six. Coil Model 2195. Distributor Model 4009. Breaker contacts separate .020-.0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring is 16-20 ounces. Distributor is of the semi-automatic type. Manual advance is 40°. Automatic advance begins at 700 R.P.M. and reaches a maximum of 16-20° at 2200 R.P.M. The breaker uses a single set of contacts with a six sided cam. To set timing, crank engine until piston No. 1 reaches the firing position. Then loosen lock screw in center of breaker cam and rotate the cam until the breaker contacts begin to separate. Tighten the screw and make certain that the rotor button is under the segment connected to the spark plug in cylinder No. 1.

IGNITION.—Eight. Coil Model 2195. Distributor Model 4008. Breaker contacts separate .0225-.0275 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. The tension of the breaker arm spring should be 16-20 ounces. Distributor is of the semi-automatic type. Manual advance is 40°. Automatic advance begins at 700 R.P.M. and reaches a maximum of 16-20° at 2200 R.P.M. Breaker uses two sets of contacts with breaker arms set at an angle of 45° on a four sided cam. Breaker contacts open alternately at intervals of 45° corresponding to 90° of crankshaft rotation. To set timing, crank engine until piston No. 1 reaches firing position. Then loosen locking screw in center of breaker cam and rotate cam until one set of breaker contacts begin to separate. Make certain that the rotor button is under the segment connected to the spark plug in cylinder No. 1. Tighten the screw. Check the second set of contacts to make certain that they open after 90° of crankshaft travel. To adjust second set of contacts loosen the two small screws on the breaker plate and turn the adjusting collar until proper position is reached. Then tighten the two hold-down screws.

Mounting.—Distributor is mounted on top of the engine. To remove distributor, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Once each month place a small bit of heavy grease on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when Piston No. 1 on compression stroke reaches a position 2 inches before top dead center (measured on the flywheel) when the flywheel marking "Upper D. C. Cylinder 1 & 6" is two inches before the dead center mark on the housing on the six cylinder car, and 1 7/8 inches before top dead center (measured on the flywheel) when the flywheel marking Upper D. C. cylinder 1 & 8 is 1 7/8 inches before the dead center mark on the housing on the eight cylinder car. The spark control lever must be in the fully advanced position.

Firing Order:—The firing order is (Six) 1-5-3-6-2-4 and (Eight) 1-3-2-5-8-6-7-4

Spark Plugs.—Spark plug diameters are 7/8-18 S.A.E. Standard. Gaps are 1/32 inch.

STARTER.—Model DH (Six), Model DM (Eight). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is a six pole, two brush machine having a single field coil. The field coil is so constructed that it winds around three sides of each coil alternating from one pole to the next so that each field pole is surrounded by a "U" shaped section of the coil.

Starter Data Model DH

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	60
25 lb. ft.	Lock	3.5	650

PACKARD
MODELS 4-26, 4-33 SIX AND 3-36, 3-43 EIGHT (1927)
OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM.
DELCO IGNITION.

Continued from preceding page.

Starter Data.			
Model DM			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	6	50
35 lb. ft.	Lock	3.5	650

Mounting.—Starter is mounted at left of engine by a standard sleeve mounting. To remove starter, remove the large pilot mounting screw and slide the starter forward. Then lift from place.

Oiling.—Starter bearings are fitted with oilless bushings. They require no attention.

GENERATOR.—Model CG-678. Generator current regulation is by the third brush system. The generator is equipped with two shunt fields, each wound on two field coils. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected across the same brushes as the light shunt field. The direction of rotation is counter-clockwise, looking at the commutator end. The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts.

Generator Data.		
Amperes.	Volts.	R. P. M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	3500

To adjust the generator out put loosen the screw in the center of the knurled nut on the generator end plate. Turn the nut to the left to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this position. Two brushes must be raised any two will do. If the generator cuts in late and does not generate over 7 amperes at peak, a short probably exists in the armature or the light shunt field is open. If the generator cuts in late and the charging rate continues to increase above 2000 R.P.M. the heavy shunt field is probably open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is probably shorted. The drive end bearing for the Model CG generator is in the engine. Before this machine can be run on the test bench a special bearing must be bolted on. This is Part No. 22196 and can be secured from the Owen-Dyneto Corporation.

Mounting.—Generator is flange mounted on the right of the engine. To remove generator, remove three flange mounting screws and pry the generator to the rear. Care must be taken not to remove the bronze plate between the generator and the chain case. Insert a screw-driver between the generator and the plate and slide the generator to the rear. Then lift from place.

Oiling.—Drive end of the generator is oiled by splash from the gear case. Put 4 or 5 drops of light machine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY:—The relay is mounted on top of the generator. Relay contacts close at 385-400 R. P. M. of the generator when the voltage reaches 6.2 volts and open with a discharge current of 0-2 amperes.

LIGHTING.—Delco Combination Switch Model No. 1307. Head lamps are 6-8 volt, 21 and 2 cp. double filament bulb. The 2 cp. filament is used for dimming. Auxiliary head lamps are 6-8 volt, 21 cp. Dome lamp is 6-8 volt, 6 cp. Dash, tail and toneau lamps are each 6-8 volt, 2 cp. All lamps except main head lamps are single contact base.

Ignition Switch.—When the switch is unlocked, the ignition lever snaps to the "On" position. The key may then be removed. When the ignition is cut off by turning the switch to the "Off" position, the switch automatically locks.

CIRCUIT BREAKER:—A vibrating circuit breaker mounted in the back of the switch takes the place of fuses. It requires a current of 25-30 amperes to start this device vibrating. While vibrating the current is 10-15 amperes.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L. Type 3-HVX-5X6. 6 volt. The starting capacity is 105 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.4 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model No. 2182. Distributor Model No. 4015. Breaker contacts separate .015 to .0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The manual advance provided is 33°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 20-24° at 1400 R.P.M. The tension of the breaker arm spring should be 13-16 ounces.

Mounting:—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from position.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To time engine, loosen distributor cup clamp screw and turn distributor cup counter-clockwise until breaker contacts begin to separate. Make certain that rotor is under contact connected to cylinder which is ready to fire. Tighten the clamp screw after making the adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 5¼ inches; tappet clearance, .010 inch; spring pressure, 55 pounds; valve lift, .348 inch; intake opens at 15° past top dead center and closes at 45° past lower dead center.

EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, ⅜ inch; stem length, 5¼ inches; tappet clearance, .010 inch; spring pressure, 55 pounds; valve lift, .348 inch; exhaust opens at 45° before lower dead center and closes 10° after top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are ⅞ inch. Gaps are .025-.030 inch.

STARTER.—Model No. 323. Starter is connected to the engine through a mechanical pinion shift combined with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2¼-2½ pounds each.

Torque		Starter Data.	
		R.P.M.	Volts
0 lb. ft.	Free	4	60
11 lb. ft.	Lock	3	450

Mounting.—Starter is mounted at right of engine. To remove, disconnect pedal return spring and pedal connecting rod. Remove large pilot mounting screw and pull starter forward from position.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model No. 353. Generator is belt driven and care must be exercised that the belt is not tight enough to cause undue wear on the bearings and yet not so loose that the generator armature will turn when the ignition switch is turned on. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. To adjust the charging rate, remove the generator cover band and shift the third brush mounting plate by means of the handle attached. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by means of friction washers.

Continued from preceding page

The charging rate is varied by loosening the generator cover band and shifting the third brush mounting plate by means of the handle attached. Shift the third brush in the direction of rotation (clockwise) to increase the charging rate and in the opposite direction to decrease the charging rate. The brush tension on each of the generator brushes should be from $1\frac{1}{4}$ to $1\frac{3}{4}$ pounds.

Mounting.—Generator is belt driven and is mounted at the forward end of the engine. To remove, remove the two flange mounting screws holding generator in position by the fan blade. Then lower generator fitting fan blade into space between car frame and engine just back of the hose connection. This will permit removal of the belt. Then lift generator from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearings oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—There is no relay. The circuit between the generator and the battery is controlled by the ignition switch.

LIGHTING.—Ignition Switch No. 1299. Lighting Switch No. 1300. Lighting switch is mounted on the base of steering wheel. Head lamps are 6-8 volt, 21 cp. double filament, using second 21 cp. filament for dimming. Stop light is 6-8 volt, 15 cp. S.C. Dome light is 6-8 volt, 4 cp. S.C. Dash, side, tonneau and tail lights are 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER.—A vibrating circuit breaker mounted on the back of the switch protects the lighting circuits. A current of 25-30 amperes will cause this device to vibrate. While operating the current is 10-15 amperes.

NASH

LIGHT SIX (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L. Type 3 HVX-5X6, 6 volt. The negative (—) terminal is grounded. The starting capacity is 105 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.4 hours. The battery is 7 7/16 by 9 3/4 by 9 1/8 inches.

IGNITION.—Coil Model IG-4065. Distributor Model IG-4110. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine flat jeweler's file. The surface of the contacts should be flat and parallel. The distributor is of the full automatic type. Automatic advance begins at 200 R.P.M. of the distributor and reaches a maximum of 15° (distributor) at 1200 R.P.M. This is equivalent to a flywheel advance of 30° at 2400 R.P.M. of the engine.

Oiling.—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks. Put one drop of light engine oil on the breaker arm hinge and place a small amount of vaseline on the face of the breaker cam every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/32 inches; stem diameter, 5/16 inch; stem length, 4 13/16 inches; tappet clearance, .005 inch (hot); spring pressure, 45 pounds; valve lift, 1/4 inch; intake opens at 5° past top dead center and closes at 45° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, 5/16 inch; stem length, 4 13/16 inches; tappet clearance, .005 inch (hot); spring pressure, 45 pounds; valve lift, 1/4 inch; exhaust opens at 45° before lower dead center and closes at 10° after top dead center. The stem guides are removable. Oversize valve stems are not made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plug.—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model MN-4108. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 184 R.P.M. taking 160 amperes at 4.7 volts. Starter brush tension should be 1 1/4-1 1/2 pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
.6 "	2700	5.5	100
2.5 "	1500	5	200
5 "	850	4.5	300
7.5 "	650	4	400
11.5 "	Lock	3	540

Oiling.—Put 4 or 5 drops of light engine oil in oiler on the drive end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The commutator end bearing is of the self-lubricating type and requires no attention.

GENERATOR.—Model GYA-4201. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove the commutator cover band and shift the third brush mounting bracket by tapping the third brush mounting stud with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting bracket is held in any desired position by friction between the third brush mounting stud and the generator end plate.

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 3.8 amperes at 6.2 volts. Generator brush spring tension is 1¼-1½ pounds each.

Oiling.—Put 3 or 4 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY.—Model CB-4007. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING.—Switch B & S Type 39890. Head lamps are each 6-8 volt, 21 cp. Double filament using second 21 cp. filament for dimming. Dash lamp is 6-8 volt, 2 cp. S. C. Dome lamp is 6-8 volt, 4 cp. S. C. Side and tail lamps are each 6-8 volt, 3 cp. S. C.

FUSES.—Generator field fuse is 5 ampere.

DELCO-REMY IGNITION

BATTERY.—Willard, Type CWR-15. 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-A. Distributor Model 636-J. Breaker contacts separate .020-.028 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type, no manual advance being provided. Rotation is clockwise, viewed from the top.

Mounting.—Distributor is mounted on top of engine block.

Oiling.—Refill the grease cup under the distributor head and turn down one turn every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper every month.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position when the flywheel marking "IGN" 1&6 UDC is opposite the indicator on the flywheel housing. To check timing, crank engine until piston No. 1 reaches this position. Then loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 9/32 inches; stem diameter, 5/16 inch; stem length, 4 7/8 inches; tappet clearance, .007-.009 inch; spring pressure, 30-40 pounds; valve lift, 9/32 inch; intake opens at 5° after top dead center and closes 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/32 inches; stem diameter, 5/16 inch; stem length 4 7/8 inches; tappet clearance, .007-.009 inch; spring pressure, 30-40 pounds; valve lift, 9/32 inch; exhaust opens at 45° before lower dead center and closes at 5° after top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER.—Model 713-G. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter brush tension is 24-28 ounces each. Starter switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting.—Starter is mounted behind the flywheel.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. At the same time fill the oiler on the drive end of the starter with a pressure oil gun.

GENERATOR.—Model 941-M. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 195-200° F. cutting a resistance into the shunt field and reducing the output approximately 50%. To adjust the generator output, loosen the small round headed screw on the generator end plate holding the third brush mounting bracket. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate.

Generator Data

7	7.73	775	14	7.85	1800
17	8.15	1400			

Shunt field current is 5 amperes at 6 volts. Generator brush tension is 24-28 ounces.

Continued on reverse side.

OAKLAND
MODEL O. S. (1927) SERIAL NOS. 120800-54 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

Mounting.—Generator is flange mounted at right of engine.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at approximately 575 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp., double filament, using Tilt-Ray system for dimming. Dash, tail, dome and side lamps are each 6-8 volt, 3 cp. S. C.

Switches.—Lighting and Ignition switch is Model 475-L. Dimmer switch (mounted on foot board) is Model 465-A. Choke control is Model 495-C.

Circuits.—Switch is of special type controlling both lights and ignition with single lever. Switch positions are 1-2-3-4 right and 5-6 left. Circuits are as follows:

- 1 Vertical—All lights and ignition off.
- 2 Right—All lights off. Ignition on.
- 3 Right—Side and tail lamps on. Ignition on.
- 4 Right—Head lamps on. Tail lamp on. Ignition on. Operation of dimmer switch on toe board dims head lamps.
- 5 Left—Side and tail lamps on. Ignition off.
- 6 Left—Head and tail lamps on. Ignition off.

FUSES.—Lighting fuse on switch is 15 amperes. A spare fuse is mounted on the switch.

6-27 (1927) SERIAL 41716-27 UP

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFKA, or 613-JFK, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 525-C. Distributor Model 637 C, L, M. Breaker contacts separate .020-.028 inch. Spring tension at contacts is 15-20 ounces. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type. Automatic advance starts at 400 engine R.P.M. and reaches maximum at 1800 R.P.M.

Mounting.—Distributor is mounted on top of the engine block. To remove distributor, first remove distributor clamp screw then lift unit from place.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one turn every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center and the flywheel marking 1&6 UDC is opposite the indicator in the crankcase peephole. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (upward movement of piston with both valves closed). Then loosen the distributor clamp screw and rotate distributor housing until breaker contacts begin to separate. Tighten the clamp screw after making the adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1 3/16 inches; stem diameter, 5/16 inch; stem length, 4 47/64 inches; tappet clearance, .007-.009 inch; spring pressure, 32-37 pounds; valve lift, 9/32 inch; intake opens at 7° past top dead center and closes at 33° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/16 inches; stem diameter, 5/16 inch; stem length, 4 47/64 inches; tappet clearance, .007-.009 inch; spring pressure, 32-37 pounds; valve lift, 9/32 inch; exhaust opens 42° before lower dead center and closes at upper dead center.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .022 inch.

STARTER:—Model 710-C or 714-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush tension is 20-28 ounces each.

Starter Data (Motor 710C)

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	5	70
10 "	Lock	3.7	450

Starter Data (Motor 714C)

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting.—Starter is mounted at left of engine by S. A. E. No. 1 flange mounting. To remove starter, first remove two flange mounting screws then lift starter from place.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is self-lubricating.

GENERATOR:—Model 943-B,C. The direction of rotation is counter-clockwise looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the small round headed screw on the generator end plate. Then remove the commutator cover band and shift the third brush mounting arm in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 17 amperes, reached at 1600 R.P.M.

11.....		2500			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 16-18 ounces.

Mounting.—Generator is mounted at left of engine by special mounting and is driven by the fan belt.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at approximately 660 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Clum Switch Model 10598. Guide "Tilt Ray" Dimmer System used. Head lamps are 6-8 volt, 21 cp. S.C. Dash, tail, side and dome lamps are each 6-8 volt, 3 cp. S.C.

FUSES.—Lighting fuse on switch is 20 amperes.

PIERCE-ARROW

MODEL 36 (1927) SERIAL NUMBERS 361000 UP DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type SJRR-6. 6 volt, 160 ampere hour. Starting capacity is 165 amperes for 20 minutes. Lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded. Battery is mounted on right chassis member in right front fender.

IGNITION:—Coil Model 2178 (Two used). Distributor Model 5265. A dual battery ignition system is used. Two ignition coils are mounted on the engine side of the dash. The right hand coil is controlled by the rear breaker in the distributor housing and fires the spark plugs at the right of the engine block over the exhaust valves. The left coil is controlled by the front breaker and fires the plugs at the left of the block over the intake valves. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. The distributor is of the semi-automatic type. Manual advance is 24-29°. Automatic advance begins at 575 R.P.M. and reaches a maximum of 14½°-17½° at 2000 R.P.M. The tension of the breaker arm spring should be 13-16 ounces. The ignition current is 4.4½ amperes at 6.5 volts with engine running, and 4.4¼ amperes at 6.2 volts with engine stopped.

Mounting:—Distributor is mounted at left of engine. To remove distributor, disconnect breaker leads and high tension cables or remove distributor head. Then disconnect manual advance rod and distributor drive coupling. Remove two base mounting screws and lift distributor from place.

OILING:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. If the track of the distributor button in the head is not well polished, apply a small amount of vaseline, removing all excess with a soft, clean cloth. Once each year repack the gear compartment with medium soft cup grease.

Timing:—Rear breaker contacts firing spark plugs over exhaust valves begin to separate when the flywheel marking "Ignition" is opposite the indicator on the flywheel case with piston No. 1 entering power stroke and the manual advance lever and breaker assembly in the fully retarded position. The front breaker contacts firing spark plugs over intake valves open 3°-9° later than this when the flywheel mark is approximately 1⅜ inches past the indicator. To set timing, retard spark lever and crank engine until piston No. 1 reaches top dead center on compression stroke (the upward stroke with both valves closed). The top dead center mark on the flywheel will then be opposite the indicator on the flywheel case. Crank engine over until the ignition mark is opposite the indicator. This is slightly after top dead center. Then loosen lock screw in center of breaker cam and rotate cam until rear set of breaker contacts begin to separate. Tighten the screw and check the front breaker contacts to see that they open after 3-9° of crankshaft rotation.

Valve Timing:—INLET VALVES:—Head diameter, 1⅞ inches; stem diameter, .406 inches; stem length, 79/16 inches; tappet clearance, .003 inch; spring pressure, 74 pounds (valve closed); valve lift, 11/32 inch; intake opens at 5° before top dead center and closes 45° after lower dead center.

EXHAUST VALVES:—Head diameter, 1.468 inches; stem diameter, .4060 inch; stem length, 79/16 inches; tappet clearance, .003 inch; spring pressure, 74 pounds (valve closed); valve lift, 11/32 inch; exhaust opens at 45° before lower dead center and closes 5° after top dead center. No oversize valve stems are made.

Motoring freely, generator draws 4.25 amperes at 6.5 volts. Shuntfield current is 2 to 3.5 amperes at 8 to 9.75 volts. Generator brush spring tension is 1¾ pounds each.

FIRING ORDER:—The firing order is 1-5-3-6-2-4.

SPARK PLUGS:—Spark plug diameters are ⅞ inch. Gaps are .030 inch.

STARTER:—Model No. 252. The starter is connected to the engine through a mechanical gear shift. The two grounded motor brushes serve as a starter switch and are allowed to come in contact with the commutator when the gear shift is operated. This completes the circuit and permits the starter to crank the engine.

Continued on reverse side.

PIERCE-ARROW

MODEL 36 (1927) SERIAL NUMBERS 361000 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

When the starter button is released, a spring reverses these operations. The starter cranks the engine at 115 R. P. M. taking 180 to 300 amperes. Running free, the current is 50 amperes at 6 volts. Lock torque is 40 lb. ft. the current being 550-600 amperes at 2.75 volts. The brush tension should be $2\frac{1}{4}$ to $2\frac{3}{4}$ pounds.

Mounting.—Starter is mounted at right of engine on a special bracket mounting. To remove, disconnect pedal return spring and pedal rod and remove two hold-down screws in motor base. Then lift starter from place.

OILING:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Once each year disassemble, clean and repack starter clutch with pure vaseline. At the same time remove grease plug in reduction gear case and repack compartment with medium heavy cup grease.

GENERATOR:—Model No. 279. The direction of rotation is counter-clockwise, looking at the commutator end. The third brush system is used for current regulation. The maximum charging rate is 22 amperes reached at 1600 R. P. M. of the generator armature or 20 M. P. H.

Generator Data.

Amperes	R. P. M.
3	600
22	1600

The average output required is 15 amperes. To adjust the charging rate, loosen the generator cover band and the lock nut on the commutator end of the generator. Then shift the third brush mounting plate, by means of the handle attached, in a counter-clockwise direction to increase the charging rate and the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment. The tension of the generator brushes should be $1\frac{3}{4}$ pounds each.

Mounting.—Generator is mounted at right of engine. To remove, disconnect coupling at either end of generator and remove hold-down from generator base. Then lift generator from position.

OILING:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M. P. H., and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the relay armature and the coil core is .015 - .020 inch, contacts closed.

LIGHTING:—Switch Model 1186. Head lamps and stop lamp are each 6-8 volt, 21 cp. S.C. Backing and stop lamps are each 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Dash, tail, auxiliary head lamps and tonneau lamp are each 6-8 volt, 4 cp. S.C.

FUSES:—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

PIERCE—ARROW

MODEL 80 (1927) SERIAL NOS. 801,001 UP DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type SJRR-4. 6 volt, 111 ampere hour. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded. Battery is mounted at the right side of the chassis under the front seat.

IGNITION:—Coil Model 2178. Distributor and Generator Model 300. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Manual advance is 40°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 14½-17½° at 2000 R.P.M. The tension of the contact arm spring is 16-20 ounces.

Mounting:—Distributor is mounted on the generator. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from position.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm and wipe out the distributor head with vaseline removing all excess. Twice each year remove the plug and repack the distributor gear case with medium soft cup grease.

Timing:—Breaker contacts begin to separate when the mark "Ignition" on the fly-wheel is 2¼ inches past top dead center with the spark control lever and the breaker assembly in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1.870 inches; stem diameter, .3715 inch; stem length, 6 1/16 inches; tappet clearance, .003 inch; spring pressure, 70 pounds (valve closed); valve lift, 11/32 inch. Intake opens at top dead center and closes at 50° after lower dead center.

EXHAUST VALVES.—Head diameter, 1.620 inches; stem diameter, .3715 inch; tappet clearance, .003 inch; spring pressure, 70 pounds (valve closed); valve lift, 11/32 inch; exhaust opens at 45° before lower dead center and closes at 5° after top dead center. Oversize valves are not made.

Firing Order:—The firing order is 1-5-3-6-2-4

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are 1/32 inch.

STARTER:—Model 336. Starter is connected to the engine through a manually operated gear shift and an overrunning clutch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2¼-2½ pounds each. Starter cranks engine at 110-120 R.P.M. taking 280-450 amperes at 4.5 volts.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
4.5 "	700	5	200
19. "	Lock	3	500

Mounting:—Starter is mounted at right of engine. To remove, disconnect pedal rod and remove three hold-down screws. Then slide starter forward and lift out.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 300. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the commutator cover band and shift the third brush mounting plate by the handle on the plate. Shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 18 amperes (generator cold) reached at 1600 R.P.M. or approximately 20-25 M.P.H. The average output required is 15 amperes. Generator brush tension should be 1¾ pounds each.

11	1000
15	1600

Mounting.—Generator is mounted at right of engine. To remove, disconnect coupling at either end of generator and remove two hold-down screws in base. Then lift generator from position.

Oiling.—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Relay contacts close when the voltage of the generator reaches 6.75 to 7.5 volts, which is reached at a car speed of approximately 8 M.P.H. and open when the discharge current reaches 0 to 3 amperes. Contacts separate .030 inch. The air gap between the reay armature and the coil core is .015-.020 inch, contacts closed.

LIGHTING.—Switch Model No. 1271. Head, stop and backing lamps are each 6-8 volt, 21 cp. S.C. Auxiliary head lamps are 6-8 volt, 4 cp. S.C. Dash, tail and tonneau lamps are each 6-8 volt, 4 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C.

FUSES.—Main circuit fuse is 30 amperes. All other fuses are 10 amperes.

PIERCE-ARROW
 Model 80 (1927)
 Delco-Remy System

Plate No. 1212A

CADILLAC

MODEL 314 (1927) AFTER ENGINE NUMBER 1-41001 DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Exide, Type 3-LXR-15-2G. 6 volt, 130 ampere hour. The starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 2195. Distributor Model 4016. Breaker contacts separate .0225-.0275 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Breaker arm spring tension should be 16-20 ounces. Ignition current is .5-2.75 amperes at 6 volts with engine running and 4.8 amperes (cold) at 6 volts with engine stopped. Distributor is semi-automatic. Manual advance is 20° (engine). Automatic advance begins at 600 R.P.M. and reaches a maximum of 30° at 2800 R.P.M.

Mounting:—Distributor is mounted between the cylinder banks at the front end of the engine, and driven from the camshaft through the spiral gears. The coil is mounted on the side of the distributor housing.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—One set of breaker contacts begins to separate when piston No. 1 on compression stroke reaches a position where the flywheel mark "IG/A-1-5" is opposite the indicator on the flywheel case. This point is 1 3/16 inches on the flywheel before top dead center; the manual advance lever must be in the fully advanced position. The breaker has two sets of contacts opening at intervals of 45° corresponding to 90° of crankshaft rotation. The second set of contacts separate when the flywheel mark "IG/A-2-6" is opposite the indicator.

Valve Timing:—INLET VALVES:—Head diameter, 1 11/16 inches; stem diameter, 3/8 inch; valve lift, 21/64 inch; tappet clearance, .004 inch (cold); spring pressure, 95 pounds (compressed to 2 15/64 inches). Inlet valves open 18° before top dead center and close 64° 40' after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; valve lift, 21/64 inch. Tappet clearance, .006 inch (cold). Spring pressure, 95 pounds (compressed to 2 15/64 inches). Exhaust valves open 56° 40' before lower dead center and close 10° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order.—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R.

Spark Plugs.—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .032 inch.

STARTER:—Model 349. Starter is connected to the engine through a mechanical pinion shift. The direction of rotation is clockwise, looking at the commutator end. Starter brush tension is 2 1/4-2 1/2 pounds each. Starter cranks engine at 104 R.P.M., taking 140-150 amperes.

Starter Data.			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
19 "	Lock	3	450

Mounting.—Starter is mounted vertically at the rear of the engine. To remove, loosen set screw in steering column plate. Remove starting pedal button and accelerator pedal. Then remove toe boards and disconnect hand throttle rod and foot throttle rod. Remove three hold down screws and lift starter from place.

Oiling.—Self-lubricating bearings are used. They require no attention.

GENERATOR:—Model 370. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. Adjustment of the third brush is secured by removing the strap and moving the third brush by hand. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The third brush is held in any desired position by friction washers. Generator is of the split field type with the third brush shunt field wound on only one field pole.

Continued on reverse side

CADILLAC

MODEL 314 (1927) AFTER ENGINE NUMBER 1-41001

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page

A straight shunt field in series with a thermostat is wound on the other field pole. Thermostat contacts open at 175°F., cutting a resistance in the field circuit and rendering the straight shunt field inoperative. Generator then runs as a third brush machine with reduced output. With maximum setting, generator output is 22 amperes at 8.6 volts reached at 1400-1600 R.P.M. Brush spring tension is 16-20 ounces. Third brush shunt field current is 4.5 amperes at 6.5 volts. Straight shunt field current is .75 amperes at 6.5 volts. Generator motoring draws 5 amperes at 6 volts.

Generator Data

Cold Test. 75°F.			Hot Test. 175°F.		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
6.....	7.8.....	600	5.....	6.9.....	600
16.....	8.0.....	1000	14.....	7.8.....	1000

Mounting:—Generator is mounted on right of engine and is driven by a silent chain, in tandem with the water pump. To remove generator, remove three screws which hold the generator to the crankcase.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model 266-N. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0.2-5 amperes. Contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimmers. Auxiliary head lamps are 6-8 volt, 3 cp. S. C. Dash, dome, tonneau and tail lamps are each 6-8 volt, 3 cp. S. C. Backing and stop lamps are each 6-8 volt, 21 cp. S. C.

SWITCHES:—Lighting switch on foot of steering column is Model 1303. Ignition switch on dash is Model 1285.

CIRCUIT BREAKER.—Model 5767. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. A current of 25-30 amperes causes it to operate. While vibrating the current flow is 10-15 amperes. The lockout circuit breaker protects the horn, inspection lamp, stop and backing lamp and cigar lighter circuits. A current of 25-30 amperes causes it to open the circuit. While operating the current flow is less than 1 ampere.

CHEVROLET

SUPERIOR MODEL V (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Exide, Type 3-XC-13-1. Willard, Type XW-13. U. S. L., Type XY-13. 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. The lighting capacity is 5 amperes for 18 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model 284-L. Distributor Model 374-A. Breaker contacts separate .030 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has no automatic advance. Manual advance is 30°.

Mounting.—Distributor is mounted at right of engine.

Oiling.—Refill the grease cup on the side of the distributor shaft and turn down one quarter turn every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts separate when No. 1 piston entering power stroke is at top dead center with the spark control lever in the fully retarded position. To set timing, retard spark control lever and crank engine until piston No. 1 reaches this position. Then loosen lock nut on top of breaker cam and pry cam upward. Rotate cam until breaker contacts begin to separate. Tighten the nut making certain that cam is correctly seated on taper shaft.

Firing Order.—The firing order is 1, 2, 4, 3.

Spark Plugs.—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER.—Model 710D. Starter is connected to the engine through an outboard Bendix drive, Type R-11. The direction of rotation is counter-clockwise looking at the commutator end. Starter cranks the engine at 140 R.P.M., taking 100 amperes at 4.8 volts. Starter switch is Model 405-C. The tension of the starter brush is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	5	70
10 "	Lock	3.7	450

Mounting.—Starter is mounted at left rear of engine. To remove starter, remove two flange mounting screws and lift from place.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is self-lubricating.

GENERATOR.—Model 943-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, loosen the small screw on the generator end plate and shift the third brush mounting plate. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment.

Generator Test Data

Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7-7.3	850			
15-17	7.95-8.05	1600	11-13	7.55-7.85	1800
11		2500			

Shunt field current is 6 amperes at 6 volts. Generator brush tension is 16-18 ounces each.

Mounting.—Generator is mounted at left of engine by special mounting. To remove, remove special clamp screw and swing generator toward engine block. Slip off generator drive belt. Then remove two mounting screws and lift generator from place.

Oiling.—Put 4 or 5 drops of light engine oil into generator oiler every two weeks. If car is driven over 500 miles in two weeks, this attention must be given every 500 miles.

Continued on reverse side.

CHEVROLET
SUPERIOR MODEL V (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 6-10 M.P.H. or 650 R.P.M. of the generator when the voltage reaches 7.25 volts and open with a discharge current of 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed. Charging current at closing of contacts is 1-3 amperes.

LIGHTING:—Clum Switch Model 10633. Head lamps are 6-8 volt, 21 cp S.C. Dimming is by resistance on switch. Side lamps are 6-8 volt, 3 cp. S. C. Dash and tail lamps are each 6-8 volt, 3 cp. S. C. Stop lamp is 6-8 volt, 15 cp. S. C.

FUSES.—Lighting fuse on back of switch is 20 amperes.

CHRYSLER

MODEL 50 (1927) SERIAL NOS. FWOOH UP DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

CHRYSLER FOUR
Model 50 (1927)
Delco-Remy System

Plate No. 1215

BATTERY:—Willard, Type WR-13. 6 volt, 84 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.6 hours. The positive (+) terminal is grounded. Battery is mounted at left of frame under the front floor board.

IGNITION:—Coil Model 525-E. Distributor Model 638-B. Breaker contacts separate .018-.023 inch. Resurface contacts on a medium hard oilstone or with a fine flat contact file. To adjust contact opening, loosen lock screw located behind stationary contact and turn eccentric adjusting screw on crescent shaped contact mounting arm until desired breaker gap is obtained. Then tighten lock screw to hold adjustment. Distributor is of the semi-automatic type. Manual advance is 22°. Automatic advance begins at 400 R.P.M. and reaches a maximum of 20.5° at 1800 R.P.M. The breaker arm spring tension should be 15-20 ounces. Ignition current is 2 amperes at 6 volts with engine running, and 5 amperes at 6 volts with engine stopped.

Mounting:—Distributor is mounted at front of engine and is accessible from the right side. Drive is by slotted tongue from the forward end of the cam shaft. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then remove two mounting bolts holding distributor bracket and gear case to forward end of engine gear case. Distributor can then be lifted from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Keep the oiler on the distributor gear compartment filled with light engine oil.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches a position .063 inches before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the up-stroke with both valves closed). Then continue to crank engine until piston No. 1 and No. 4 reach a position .063 inch before top dead center. Make certain that the spark control lever is in the fully advanced position. Loosen the clamp screw holding distributor in position on spark control lever and rotate distributor until contacts begin to separate. Tighten the clamp screw and replace the rotor and distributor head. Make certain that the rotor is opposite the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .004 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; intake opens at top dead center and closes at 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .006 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; exhaust opens at 48° before lower dead center and closes 2° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .030 inch.

STARTER:—Model 712-F. Starter is connected to the engine through an outboard Bendix drive Type R-11-X. The direction of rotation is counter-clockwise looking at the commutator end. Starter cranks the engine at 150 R.P.M. taking 150 amperes at 5 volts. Starter switch is Model 404-V. Starter brush tension is 24-28 ounces.

Continued on reverse side.

6.0 "	550	4.4	300
9.4 "	150	4.0	400
11.0 "	Lock	3.7	450

Mounting:—Starter is flange mounted at left of engine on forward side of bell housing. To remove starter, disconnect starter cable and remove two flange mounting screws. Then slide starter from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The bearing on the drive end is oilless.

GENERATOR:—Model 947-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, remove the commutator cover band and loosen the small round headed screw on the commutator end plate of the generator. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum output is 17 amperes (cold) reached at 1800 R.P.M. or 20-22 M.P.H.

11	7.6	3000			
9.4	7.4	3500			

Field current is 4.5 amperes at 6 volts. The generator brush tension should be 24-28 ounce.

Mounting:—Generator is cradle mounted at front end of the engine and is belt driven. The fan is mounted on the forward side of the generator drive belt. To remove generator, disconnect generator lead and loosen the generator cradle stud nut which is the large nut directly under the generator holding the generator cradle bracket in position. Then lower generator and cradle and slip off drive belt. Loosen nut on generator mounting strap and slide generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on each end of the generator every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Clum Switch Model 10607. Head and stop lamps are each 6-8 volt, 21 cp. Dimming is by resistance on the switch. Dash, side and tail lamps are each 6-8 volt, 3 cp. Dome lamp is 6-8 volt, 15 cp. Stop lamp connected to fuse terminal on switch is 6-8 volt, 15 cp.

FUSES:—Lighting fuse on back of switch is 30 amperes.

DANIELS

MODEL 25-38 (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Willard, Type SJR-5. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2127. Distributor Model No. 5212. Breaker contacts separate .018 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with fine emery cloth or against the flat side of an emery wheel finishing on a hard oilstone. Manual advance is 18-22°. Automatic advance begins at 580 R.P.M. and reaches a maximum of 13-15° at 2400 R.P.M. The tension of breaker arm spring should be 16-20 ounces.

Mounting.—To remove distributor, disconnect manual advance rod and remove two hold down screws. Then lift distributor from place.

Oiling.—Put 4 or 5 drops of light engine oil in the upper ball bearing every two weeks. If the track of the rotor in the distributor head is not well polished, apply a small amount of vaseline with a soft cloth. Clean out and repack the distributor housing with soft cup grease every six months. This housing contains the automatic advance and retard mechanism.

Timing.—Breaker contacts begin to separate when the piston entering power stroke is on top dead center, spark control lever and breaker assembly one-third advanced.

Firing Order.—The firing order is 1L, 2R, 3L, 1R, 4L, 3R, 2L, 4R.

Spark Plugs.—Diameter 7/8 inch. Spark gaps are .031 inch.

STARTER.—Model No. 170. Starter is connected to the engine through a set of reduction gears meshed by the operator. The raising and lowering of the two grounded starter brushes serves as a starting switch. Lock torque is 27 lb. ft. at 2.75 volts. The starter running free takes 60 amperes at 6 volts. The direction of rotation is clockwise, looking at the commutator end. The tension of each of the starter brushes should be from 2 1/4 to 2 3/4 pounds.

Mounting.—To remove starter, remove starting pedal return spring and pedal rod. Then remove water pump. Remove motor hold down screws and lift from place.

Oiling.—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every 1000 miles or each month. Saturate the wick in the oiler at starter gear end of motor once each year. Remove grease plug and repack reduction gear housing with medium heavy cup grease once every six months. Disassemble motor clutch once each year and after cleaning it, repack with vaseline.

GENERATOR.—Model No. 169. Generator current regulation is by the third brush system. The direction of rotation is counter-clockwise, looking at the commutator end. The maximum charging rate is 20-22 amperes, reached at 1450 R.P.M. of the armature or approximately 20 M.P.H. To adjust the charging rate, loosen the three screws in the bearing retainer plate on the end of the generator and shift the third brush. Moving the third brush in the direction of rotation (counter-clockwise) increases the charging rate and in the opposite direction decreases the charging rate. After making the adjustment tighten the three screws.

Generator Data

Amperes	R.P.M.
0.....	600
12.....	1000
18-22.....	1450

The shuntfield current is 2 amperes at 6 volts. The tension of the generator brushes should be 1 1/2-2 pounds each.

Mounting.—To remove generator, drain radiator and remove. Then jack up front end of engine and remove all engine bolts. Remove front gear cover and water pump. Then remove generator mounting studs and lift generator from place.

Oiling.—Put 5 or 6 drops of light engine oil in each of the generator oilers every two weeks. If the car is driven more than 500 miles in two weeks, the oiling must be done every 500 miles.

Continued on reverse side

DANIELS

MODEL 25-38 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page

RELAY.—Relay is mounted on the generator frame. Relay closes at 8 miles per hour or 500-550 R.P.M. of the armature, and opens at 6 miles per hour or 450-500 R.P.M. of the armature. Relay contacts separate .046 to .062 inch. Air gap between relay armature (moving member) and coil core is .040 inch, contacts closed. To adjust relay, connect a voltmeter between the positive generator brush and ground. Then slowly speed up the generator and adjust the relay spring tension until the relay contacts close when the voltmeter indicates 7.5 volts. Clean the relay contacts by drawing unglazed paper between them. If badly burned or pitted, resurface with well worn No. 00 sandpaper. Remove all grit. Adjust before again putting into service.

LAMPS.—Head lamps are 6-8 volt, 21 cp. Dimmer lamps are 6-8 volt, 4 cp. Dash and tail lamps are 6-8 volt, 2 cp. Dome lamp is 6-8 volt, 2 cp.

Switch.—Combination switch is Delco Model 1161.

CIRCUIT BREAKER.—A vibrating circuit breaker takes the place of fuses. It requires 25 amperes to start the vibrator. While vibrating the current is 10-15 amperes.

Delco-Remy System

Plate No. 1217

BATTERY.—Willard, Type LWR-13. 6 volt. 98 ampere hour. Starting capacity is 107 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.6 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 637-N. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25° (engine). Maximum automatic advance is 20.5° (engine). Breaker arm spring tension is 15-20 ounces.

Oiling.—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position .030 inch before top dead center with the manual spark control lever in the fully advanced position.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .004 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; inlet opens 3° after top dead center and closes 137° after top dead center (or 43° before lower dead center).

EXHAUST VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .006 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; exhaust opens 135° after top dead center (or 45° before lower dead center) and closes 5° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Mounting.—Distributor is mounted on top of the cylinder head. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are 0.27-.030 inch.

STARTER.—Model 714-D. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 178 R.P.M., taking 164 amperes at 5.1 volts. Starter brush tension is 26 ounces each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
2 "	1650	5.1	150
6 "	700	4.5	280
12 "	Lock	3.63	475

Switch.—Starting switch is Model 404-T.

Mounting.—Starter is barrel mounted at left of flywheel housing. To remove starter, remove pilot set screw on top of housing and slide starter from position.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model 941-X. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the small round headed screw on the generator end plate and shift the third brush. Shifting the brush in a counter-clockwise direction increases the charging rate, and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 14-16 amperes reached at 1500 R.P.M. or 22 M.P.H.

Continued on reverse side.

12	7.8	1075	11	7.6	1700
15	8.0	1600	8.6	—	2500
10.8	—	2500			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 18-24 ounces each.

Mounting.—Generator is mounted at right of engine by a No. 3 S. A. E. flange mounting to the timing gear chain case. To remove generator remove cover plate on front of case and remove three nuts holding generator in place. Then slide generator to rear, removing chain, but being careful that chain does not slip over cam shaft sprocket, or engine camshaft timing will be disturbed.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is oiled by splash from the gear case.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay closes when the generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch. contacts closed.

LIGHTING.—Clum Switch Model 10629. Head lamps are 6-8 volt, 21 cp. S.C. Stop and dome lamps are each 6-8 volt, 15 cp. S.C. Side, dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES.—Lighting fuse on switch is 30 amperes.

NOTE.—Electric gasoline gauge is connected to the ignition terminal on the lighting switch.

CHRYSLER

IMPERIAL MODEL E (80) (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—Willard, Type SJ WR6, 6 volt. Starting capacity is 166 amperes for 20 minutes. Lighting capacity is 5 amperes for 30.6 hours. The positive (+) terminal is grounded. Battery is mounted under front floor boards.

IGNITION:—Coil Model 525-E. Distributor Model 656-E. Breaker contacts separate .022 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Distributor is of the semi-automatic type. Manual advances 15° (engine). Automatic advance begins at 400 R.P.M. and reaches a maximum of 20.5° at 3200 engine R.P.M. Total advance is 35.5°. Distributor uses two sets of breaker contacts on a three sided cam and opens alternately at intervals of 60° corresponding to 120° of crankshaft rotation. (See timing for contact adjustment.)

Mounting:—Distributor is mounted on top of engine block on right side. To remove distributor, disconnected coil lead and high tension cables or remove distributor head. Then disconnect manual advance rod and remove manual advance stop screw. Lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks or each 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .046 inch before top dead center with the spark control lever in the fully advanced position. The second set of contacts open exactly 60° after this point when the piston in the next cylinder firing also reaches a position .046 inch before top dead center. To check timing crank engine until contacts mounted on stationary breaker plate begin to separate. See that piston position is .046 before top dead center. Check contacts on adjustable plate by special scale furnished by distributor manufacturer. If interval between two firing points is not 60° loosen two last plate locking screws and turn adjusting screw until the proper position is reached. Then tighten the lock screws.

Valve Timing:—INLET VALVES:—Head diameter, 1 21/32 inches; stem diameter, 3/8 inch; stem length, 6 3/16 inches; tappet clearance, .006 inch; spring pressure, 90-95 pounds; valve lift, 5/16 inch; inlet opens 6° after top dead center and closes 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 21/32 inches; stem diameter, 3/8 inch; stem length, 6 3/16 inches; tappet clearance, .008 inch; spring pressure, 90-95 pounds; valve lift, 5/16 inch; exhaust opens 42° before lower dead center and closes 8° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .028 inch.

STARTER.—Model 732-AB. Starter is connected to the engine through a manual pinion at 5.35 volts. The direction of rotation of armature shaft is clockwise, looking at the commutator end. Starter brush tension should be 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2000	5.6	65
5.6 "	680	5.0	200
10.8 "	400	4.5	300
17.2 "	240	4.0	400
24.0 "	120	3.5	500
30.8 "	Lock	3.0	600

A small auxiliary terminal is located on the starter frame. The battery levelite line is connected to it and is connected to the battery when the starter switch is closed.

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing. The oil-filler pipe must be removed before the starter can be taken off the engine.

Continued on reverse side.

CHRYSLER **IMPERIAL MODEL E (80) (1927)** **DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO-REMY IGNITION**

Continued from preceding page.

To remove starter, disconnect cables on starter switch and battery level-lite wire from auxiliary terminal. Then disconnect starter shifting lever rod. Loosen lock nut and remove large pilot mounting screw from flywheel case above starter mounting sleeve. Slide starter forward from place.

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every 1500 miles. The reduction gear compartment is packed with graphite grease. A small pipe plug on the top of the gear case should be removed to add grease when this becomes necessary.

GENERATOR.—Model 945-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165° F. and cut a resistance into the field circuit, reducing the output approximately 50%. To adjust charging rate, loosen the small round headed screw on the outside of the generator end plate and shift the third brush mounting bracket. Shifting the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 20 amperes at 8.5 volts, reached at 1300 R.P.M. Generator brush tension should be 22-28 ounces. Shuntfield current is 5 amperes at 6 volts.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	340	0	6.4	460
8	7.2	560	6	7.0	720
14	7.9	740	12	7.6	1400
19	8.4	1300	8.8	—	2400
12	—	2400			

Mounting:—Generator is mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove three flange mounting nuts holding generator to chain case. Slide generator to rear, being careful not to disturb intermediate flange carrying drive gear.

and open with a discharge current of 0-3 amperes. Contacts separate .013 inch.

Oiling.—Put 4 or 5 drops of light engine oil in the generator bearing oilers every month or each 1000 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 600 R.P.M. of the generator armature when the voltage reaches 7.2 volts and open with a discharge current of 0-3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21 cp., using double filament. A dimmer resistance mounted on the dimmer switch at the foot of the steering column is used for dimming. Stop and backing lamps are each 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Tail and tonneau lamps are each 6-8 volt, 3 cp. S.C. Battery solution level indicator lamp is 3-4 volt, 3 cp. S.C.

Switches:—Remy Lighting Switch No. 816609.

FUSES:—Lighting fuses are 30 amperes.

 Delco-Remy System

Plate No. 1218A

RICKENBACKER

MODEL 6-70 (1927)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY.—Willard, Type CW-15. 6 volt, 105 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model TC-30. Distributor Model T-6294. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling.—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper and put one drop of oil on the interrupter arm pivot pin every month.

Timing.—Breaker contacts begin to separate when mark "0" on front flywheel is directly in the center on top with piston No. 1 on compression stroke. The spark control lever and breaker assembly should be in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen screw in center of breaker cam and rotate cam until contacts begin to separate. Then tighten the screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, .373-.372 inch; stem length, 5 5/16 inches; tappet clearance, .008 inch; spring pressure, 61 pounds; valve lift, 5/16 inch; intake opens at top dead center and closes at 50° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, .3725-.3715 inch; stem length, 5 5/16 inches; tappet clearance, .008 inch; spring pressure, 61 pounds; valve lift, 5/16 inch; exhaust opens at 45° before lower dead center and closes at 5° past top dead center. The guide stems are removable. No oversize valve stems are made. A variance of .020 inch is allowed in stem length.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plugs are S. A. E. Standard 7/8-18. Gaps are .025 inch.

STARTER.—Model No. 966. Starter is connected to the engine through a manually operated pinion shift. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M., taking 150 amperes at 6 volts. Starter brush tension is 13/4-2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	50
15 "	Lock	4	500

Oiling.—Starter bearings are oilless. They require no attention.

GENERATOR.—Model No. 1066. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, insert a special Bosch key in the hole on the generator end plate and shift the third brush by turning the key. The third brush may be shifted by hand by removing the commutator cover band. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 12-14 amperes, reached at 1600-1800 R.P.M. or 20 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY.—Willard, Type CWR-19. 6 volt, 135 ampere hour. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded.

IGNITION.—Coil Model No. 2190. Distributor Model No. 5292. Breaker contacts separate .020 to .0275 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Manual advance is 25°. Automatic advance begins at 850 R.P.M. and reaches a maximum of 25° at 3600 R.P.M. Distributor uses two sets of contacts operating on a single cam. Breaker arms are set at an angle of 45° and open alternately.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks, or each 500 miles if the car is driven more than 500 miles in two weeks. Put a small bit of medium heavy grease or vaseline on the surface of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. Set timing when piston No. 1 reaches this position. Then check position of rotor to make certain that short segment of rotor button is under segment in distributor head connected to spark plug in cylinder No. 1. Loosen the screw in the center of the breaker cam and rotate cam until breaker contacts begin to separate. Then tighten the screw. Check opening of other set of contacts by rotating distributor shaft exactly 45° using a scale to check rotation and shifting breaker mounting plate until contacts open at the proper instant. They may also be checked by cranking engine over 90° from firing position of No. 1 cylinder when piston No. 6 will reach top dead center entering power stroke. The second set of contacts should open at this point.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, .373-.372 inch; stem length, 5 5/16 inches; tappet clearance, .008 inch; spring pressure, 61 pounds; valve lift, 5/16 inch; intake opens at top dead center and closes at 50° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, .3725-.3715 inch; stem length, 5 5/16 inches; tappet clearance, .008 inch; spring pressure, 61 pounds; valve lift, 5/16 inch; exhaust opens at 45° before lower dead center and closes at 5° past top dead center. The guide stems are removable. No oversize valve stems are made. A variance of .020 inch is allowed in stem length.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch

STARTER.—Model No. 957. Starter is connected to the engine through a manually operated pinion shift and overrunning clutch. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. taking 120 amperes at 5.65 volts.

Starter Data			
Torque	R.P.M.	Volts.	Amperes.
0 lb. ft.	1800	6	60
.....	120	5.4	120
Lock.	0	5	550

Oiling:—Self-lubricating bearings are used. They require no attention.

GENERATOR.—Model 1066. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, insert the special Bosch key in the hole on the generator end plate and shift the third brush by turning the key. The third brush may be moved by hand by removing the commutator cover band. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 12-14 amperes reached at 1600-1800 R.P.M. of the generator or approximately 30 M.P.H.

FUSES:—Generator field is 5 ampere. Lighting fuse is 20 ampere.

CUNNINGHAM

SERIES V-7 (1927)

SERIAL NOS. 5011 UP

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—Willard, Type SJRR-5, 6 volt. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded. Battery is mounted on right side of chassis under the front floor board.

IGNITION:—Coil Model 2178. Distributor Model 5299. Breaker contacts separate .015-.020 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 38° (engine). Automatic advance begins at 800 R.P.M. and reaches a maximum of 15° at 2100 R.P.M.

Mounting:—Distributor is mounted at the forward end of the engine between the cylinder banks. To remove distributor, disconnect manual advance rod and breaker lead and remove distributor head or disconnect high tension cables. Then remove two hold down screws and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches top dead center with the manual spark control lever in the fully retarded position. At this point the flywheel marking "EX.C.IN.O." will be opposite the indicator on the flywheel case.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/8 inches; stem diameter, .432 inch; stem length, 6 1/8 inch; tappet clearance, .0015 inch; spring pressure, 75 pounds; valve lift, 11/32 inch; intake opens at 5° past top dead center and closes 51° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/8 inches; stem diameter, .432 inch; stem length, 6 1/8 inches; tappet clearance, .003 inch; spring pressure, 75 pounds; valve lift, 11/32 inch; exhaust opens at 41° before bottom dead center and closes 5° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1R, 1L, 4R, 4L, 2L, 3R, 3L, 2R.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .031 inch.

STARTER:—Model 350. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	4	60
19 "	Lock	3	500

Mounting:—Starter is flange mounted at right of engine. To remove starter, disconnect starter cable and remove three flange mounting screws. Then slide starter from place.

Oiling:—Self-lubricating bearings are used. They require no attention.

GENERATOR:—Model 285. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen locknut in generator end plate and shift third brush. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the lock nut after making the adjustment. With maximum third brush setting the output is 18-20 amperes at 7.5 volts reached at 1600 R.P.M. of the generator. Brush tension should be 24-28 ounces each.

Generator Data		
Amperes	Volts	R.P.M.
3		600
9		800
18-20	7.5	1600

Mounting:—Generator is cradle mounted on front end of motor and is accessible from the left side of engine. To remove generator, disconnect generator lead and remove lock nut and nut from hold down strap. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 5766. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-3 amperes. Relay contacts separate .015-.020 inch. Air gap between relay armature and coil core is .025-.035 inch, contacts closed.

LIGHTING:—Delco Combination Switch Model 1281. Head, stop and backing lamps are each 6-8 volt, 21 cp. S.C. Side, dome, corner and step lamps are each 6-8 volt, 4 cp. D.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on back of the switch. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

ACCESSORIES:—Waltham Clock.

DUPONT

MODEL "D" (1925-26) E (1927)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Westinghouse, Type 6-OB-13, 6 volts. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 19 hours. The positive (+) terminal is grounded. Battery is mounted under front seat on right side.

IGNITION:—Coil Model TC-30. Distributor Model TM-662. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface with a fine, flat jeweler's file. If the points are excessively worn, they should be replaced.

Mounting:—Ignition Coil is mounted on the dash. Distributor is mounted at front of engine on right side. To remove distributor disconnect manual advance lever, breaker lead and high tension cables or remove distributor head. Then remove set screw and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every month or each 1000 miles if the car is driven more than 1000 miles in a month. Put one drop of oil on the breaker arm pivot pin and place a small bit of heavy grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are about .025 inch.

STARTER:—Model 930. Starter is connected to the engine through a Bendix drive. The direction of location is counter-clockwise, looking at the commutator end. Starter brush tension is 1 3/4-2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lbs. ft.	4000	6	35-45
12 "	Lock	3.4	450

Mounting:—Starter is mounted at rear of engine on right side. To remove starter disconnect starter cable and remove three flange mounting bolts. Then slide starter from place.

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model 1047. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, shift the third brush mounting plate by turning the small screw on the generator end plate. On later cars, a special Bosch key must be inserted in a hole on the generator end plate to shift the brush. Shifting the third brush in a counter-clockwise direction increases the charging rate. The third brush may be shifted by hand if the commutator cover band is removed.

Continued from preceding page.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay is mounted on top of the generator. Relay contacts close at 500 R.P.M. or 6-8 M.P.H. when the voltage of the generator reaches 6.5-7.5 volts and open at 450 R.P.M. or 5-6 M.P.H. with a discharge current of 0-2 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Head lamps are each 6-8 volt, 21 cp. S.C. Dimmer lamps are 6-8 volt, 4 cp. S.C. Cowl lamps are 6-8 volt, 2 cp. D.C. Dash, tonneau, dome, corner and inspection lamps are each 6-8 volt, 2 cp. D.C. Stop, backing and tail lamps are 6-8 volt, 2 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 15 amperes.

OLDSMOBILE

MODEL E-30 (1927) FIRST 12,000 CARS DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Willard, Type XW-13. 6 volt, 90 ampere hour. The starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 2198. Distributor Model 5284. Breaker contacts separate .020-.027 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Distributor is of the full automatic type. Automatic advance begins at 600 R.P.M. and reaches a maximum of 26-30° at 2800 R.P.M. The tension of the breaker arm spring is 13-16 ounces. Ignition coil is of the new type with switch and lock in the coil. It is mounted on the back of the instrument board with the switch extending through to the face of the instrument panel. The ignition switch cannot be turned "On" until it has been unlocked and the key removed. Turning the switch "Off" automatically locks the ignition.

Mounting.—Distributor is mounted on the rear of the generator. To remove, loosen the timing adjustment clamp nut. Then lift distributor from place.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position .055 inch before top dead center. To time engine, loosen the distributor clamp screw and rotate distributor housing until contacts begin to separate. Then tighten the screw to hold the adjustment. Make certain that the rotor is under the segment connected to the spark plug in the cylinder firing.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027 inch.

STARTER:—Model 354. The starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter switch is Model 1952. Starter brush tension is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	45
15 "	Lock	3.5	

Mounting.—Starter is mounted at left of engine by a sleeve mounting. To remove, remove large pilot mounting screw and slide starter to rear and out.

Oiling.—Self-oiling bearings are used. They require no attention.

GENERATOR:—Model 352. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system, combined with a thermostat. To adjust generator output, loosen locking nut on the outside of the end frame. Then shift third brush mounting plate by turning the stud on the generator end plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The generator brush tension should be 16 to 20 ounces.

Generator Data.

Amperes	R.P.M.
5	800
12	1200

Mounting.—Generator is mounted at right of engine. To remove, loosen carburetor mounting screws and drop carburetor. Then remove three flange mounting screws and lift out generator, taking care to prevent timing chain slipping off sprocket and

Continued on reverse side.

OLDSMOBILE

MODEL E-30 (1927) FIRST 12,000 CARS DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles. Every six months remove the plug in the distributor gear case and replenish with medium cup grease.

RELAY:—Relay is mounted on top of the generator.

LIGHTING:—**Lighting Switch Model 1303.** Switch is mounted at base of steering column. Head lamps are 6-8 volt, 21cp. double filament using second 21 cp. filament for dimming. Dash, dome and tail lamps are each 6-8 volt, 2 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the dash. It is in the lighting switch lead and protects the lighting lines. A current of 25-35 amperes will cause the circuit breaker to vibrate limiting the current flow to 10-15 amperes.

WILLYS KNIGHT

MODEL 66 (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-8X, 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 33.2 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4107 superseded by Model IG-4131. Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 30° (Engine). Automatic advance begins at 200 R.P.M. of the engine and reaches a maximum of 30° (Engine) at 3100 R.P.M. of the engine.

Oiling:—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° before top dead center as measured on the flywheel with the spark control lever in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model ML-4105. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 150 amperes at 5.35 volts. Starter brush tension is 1 1/4-1 1/2 pounds each. Starter switch is Model SW-4001.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
1.1 "	1940	5.5	100
4.2 "	1050	5.0	200
7.8 "	650	4.5	300
11.4 "	360	4.0	400
16.0 "	Lock	3.0	560

Oiling:—Put 5 to 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model GJA-4109 superseded by Model GRE-4207. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output remove the commutator cover band and shift the third brush mounting bracket by tapping on the third brush mounting stud with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The third brush is held in any desired position by friction between the third brush mounting stud and the generator end plate. The charging rate with maximum third brush setting is 17 amperes at 8 volts on the Model GJA-4109 generator and 18.4 amperes at 7.8 volts reached at 1200 R.P.M. on the Model GRE-4207 generator.

10.2	7.3	3200			

Shuntfield test current is 2.2 amperes at 6.2 volts. Motoring freely, generator draws 5 amperes at 6 volts. Generator brush tension should be 1¼-1½ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model CB-4007. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 10482. Head, stop and gutter lamps are each 6-8 volt, 21 cp. S.C. Side, tail and dash lamps are each 6-8 volt, 3 cp. S.C. Dome lamp is 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

ROLLS ROYCE

MODEL 40-50 (1927)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH BATTERY IGNITION

BATTERY.—Exide. Type 3-XX-21-1. 6 volt. The starting capacity is 163 amperes for 20 minutes. The lighting capacity is 5 amperes for 30 hours. The positive (+) terminal is grounded at the starting motor.

IGNITION.—A double ignition system using two coils and two distributor heads is used. The breaker contacts in both heads open simultaneously. Breaker contacts separate .020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone.

Mounting.—Distributor is mounted at right of engine on the governor control assembly.

Oiling.—Remove the plug on the gear case and give the gear compartment one charge of engine oil from the oil gun. Put 8 or 10 drops of engine oil in the oiler on the side of each of the distributors and put one drop of oil on the breaker arm pivot pin after removing the distributor head and rotor. Place a small bit of grease on the face of the breaker cam under the fiber bumper. This oiling must be done every 2,000 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position when the flywheel marking "Li" is opposite the aluminum pointer above the flywheel, with the manual spark control lever in the fully retarded position. Both breaker contacts should open at the same time. Set timing by loosening the lock screw on the manual advance lever and rotating the distributor head until the breaker contacts separate. Then tighten the screw. Test ignition by running on one set of plugs by placing ignition switch lever in Positions 1 or 2. In service the car should always be run with double ignition.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plug gaps are .030 inch.

STARTER.—Frame No. 778, Style S-382435-A. Starter is connected to the engine through a system of epicyclic gears and chain to the transmission. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 70 R.P.M. Lock torque is 31 lb. ft. starter drawing 800 amperes at 4 volts. The pressure of the starter brushes should be 2½ to 3 pounds each.

Mounting.—Starter is mounted at the right of the transmission case under the floor boards of the front compartment.

Oiling.—Fill the starter bearing oilers with light engine oil every 2000 miles.

GENERATOR.—Frame No. 57-IR, Style S-416699. The direction of rotation is counter-clockwise, looking at the commutator end. Generator regulation is by a constant voltage relay-regulator. This causes the charging rate to vary with the condition of the battery giving a high rate when charging a discharged battery tapering off as the battery becomes charged. The maximum charging rate is reached at 1200 R.P.M. or 20 M.P.H. Charging rate is adjusted by increasing or decreasing the regulator spring tension by turning the regulator adjusting screw. Turning the screw in a clockwise direction increases the voltage and in the opposite direction decreases the voltage. This regulates the charging rate by changing the shunt field current.

Generator Data.

Amperes	Volts	R.P.M.
0.....		400
8.....		525
15.....		1200

Motoring freely generator draws 5 amperes at 6 volts. Shunt field current is 1.4 amperes.

ROLLS ROYCE

MODEL 40-50 (1927)

WESTINGHOUSE GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH BATTERY IGNITION

Continued from preceding page.

RELAY-REGULATOR—Relay contacts close at 600 R.P.M. of the generator or 10 M.P.H. with a voltage of 6.5 volts and open at 500 R.P.M. or 9 M.P.H. with a discharge current of 0.1 amperes. Air gap between relay armature and frame is .055-.060 inch. Regulator air gap is .055-.060 inch. Center gap is .015 inch.

LIGHTING—Switch, Delco Model 1216. Head, auxiliary and stop lamps are each 6-8 volt, 21 cp. S. C. Side and tail lamps are each 6-8 volt, 2 cp. S. C. All body lamps are 6-8 volt, 2 cp. D. C.

FUSES—All fuses are 10 amperes. Four spare fuses are mounted in clips on the fuse box cover.

VELIE MODEL 50—STANDARD SIX (1927) SERIAL NOS. 160101 AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK. Starting capacity is 123 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model IG-4064. Distributor Model IG-4146. Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped.

Mounting:—Ignition coil is mounted at front of engine on left side. Distributor is mounted at left of engine near front. To remove distributor, disconnect high tension coil lead and breaker lead. Then remove head or disconnect spark plug leads. Loosen set screw on side of distributor bracket and lift distributor from place.

Oiling:—Turn grease cup on side of distributor down one-half turn every 250 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 5° after top dead center (measured on the flywheel) with the breaker assembly in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 5/16 inch; stem length, 5 9/32 inches; tappet clearance, .008 inch; spring pressure, 42 pounds; valve lift, 5/16 inch; intake opens at 7° past top dead center and closes at 47° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 5/16 inch; stem length, 5 9/32 inches; tappet clearance, .008 inch; spring pressure, 42 pounds; valve lift, 5/16 inch; exhaust opens at 45° before lower dead center and closes at 5° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MN-4119. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 1 1/4-1 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
0.6 "	2800	5.5	100
2.9 "	1500	5.0	200
5.5 "	850	4.5	300
8.2 "	420	4	400
12.25 "	Lock	3	550

Mounting:—Starter is mounted on right side of engine at the rear. To remove starter, disconnect starter cable and remove set screw on top of housing. Then slide starter forward and lift from place.

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model GTB-4201. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove cover band and loosen nut holding third brush mounting bracket. Then shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 15 amperes is reached at 1800 R.P.M. or 21 miles per hour.

DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 615-JFK. Starting capacity is 143 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under driver's seat.

IGNITION:—Coil Model 525-A. Distributor Model 637-H. Breaker contacts separate .018-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Stationary contact is mounted on plate and is held in position by small locking screw back of the contact. To adjust contact opening, loosen this locking screw and turn eccentric adjusting screw on plate until proper setting is obtained. Then tighten lock screw. Breaker arm spring tension is 15-20 ounces. Distributor is of the semi-automatic type. Manual advance is 15° engine. Automatic advance begins at 400 engine R.P.M. and reaches maximum of 28° at 1800 engine R.P.M. Total advance is 43° engine.

Mounting:—Ignition coil is mounted at front of engine on left side. Distributor is mounted at left of engine near front. To remove distributor, loosen clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 5° after top dead center (measured on the flywheel) with the breaker assembly in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen clamp screw and rotate distributor housing until contacts begin to separate. Then tighten the clamp screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 11/16 inches; stem diameter, 3/8 inch; stem length, 5 7/16 inches; tappet clearance, .008 inch; spring pressure, 55 pounds; valve lift, 5/16 inch; intake opens at 7° past top dead center and closes at 47° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; stem length, 5 7/16 inches; tappet clearance, .008 inch; spring pressure, 55 pounds; valve lift, 5/16 inch; exhaust opens at 45° before lower dead center and closes at 5° past top dead center. Stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 720-P. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125-145 R.P.M. taking 150-175 amperes at 4.9 volts. Starter brush tension should be 24-28 ounces. Starter switch is Model 405-D.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is mounted at rear of engine on the right side. To remove starter, disconnect starter lead and remove set screw on top of housing. Then slide starter forward from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter bearing oiler every month or each 1000 miles.

GENERATOR:—Model 941-R. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at approximately 160°F. cutting a resistance into the shuntfield circuit and reducing the output 40-50%. To adjust the generator output, loosen the small round-headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a

21	8.35-8.5	1450			

The shuntfield current is 5 amperes at 6 volts. Generator brush tension should be 24-28 ounces each.

Mounting:—Generator is mounted on left side of engine near the front. To remove generator, disconnect generator lead and drive coupling. Then remove three base mounting screws and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 675 R.P.M. of the generator or approximately 9 M.P.H. when the generator voltage reaches 7.25 volts. Relay opens when the discharge current reaches 0-2.5 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Lighting Switch Model 420-G. Switch is mounted at base of steering column. Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 5 cp. S.C. Dash, tail and dome lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—There are five fuses mounted on back of switch. They are 10 amperes.

STAR

MODEL M (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY.—U. S. L. 3 CVG-5X. 6 volt, 84 ampere hour. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.2 hours. The negative terminal is grounded.

IGNITION:—Coil Model IG-4063. Distributor Model IG-4036D. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. Points can also be cleaned with a "Tungsten Point File." Thoroughly wipe off points with a clean rag after resurfacing. Distributor is of the manual type. Manual advance is 50° (measured on flywheel) or 25° of the distributor. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped.

Mounting:—Ignition coil is mounted on the generator. Distributor is mounted on right hand side of motor, on generator. To remove distributor, loosen mounting clamp screw and remove spark plug wires from spark plugs.

Oiling.—Put 4 or 5 drops of light oil in the distributor wick oiler every two weeks or 200 miles.

Timing.—Breaker contacts begin to separate when piston No. 1 on the compression stroke is at top dead center with spark control lever and breaker assembly in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1.5 inches; stem diameter, 3/8 inch; stem length, 5 1/4 inches; tappet clearance .006 inch (cold motor); spring pressure 78 1/2 pounds opened, 51 pounds closed. Valve lift, 5/16 inch; intake opens 4° past top dead center and closes 46° past lower dead center.

EXHAUST VALVES:—Head diameter, 1.5 inches; stem diameter, 3/8 inch; stem length, 5 1/4 inches; tappet clearance, .008 inch (cold motor); spring pressure, 78 1/2 pounds opened, 51 pounds closed. Valve lift, 5/16 inch; exhaust opens at 41° before lower dead center and closes 1° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order.—The firing order is 1-3-4-2.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .025 to .030 inch.

STARTER.—Model No. MO-4102. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter cranks the engine at 220 R.P.M. taking 180 amperes at 5.2 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
2 lbs. ft.	1700	5.1	180
5 lbs. ft.	700	4.4	315
7 lbs. ft.	230	4.0	395
10 lbs. ft.	Lock	3.6	490

Mounting:—Starter is mounted on right hand side of motor attached by a clamping strap. To remove starter, first remove clamping bolt.

Oiling.—Self-oiling graphite bronze bearing used on commutator end. Put 8 to 10 drops of oil in oiler on drive end head every 1000 miles.

GENERATOR.—Model GT-4001A. The direction of rotation is counter-clockwise looking at the commutator end. The third brush system is used for current regulation. To increase the charging rate shift the third brush in the direction of armature rotation (counter-clockwise) and in the opposite direction to decrease the charging rate. The maximum charging rate of 14 amperes is reached at 1450 R.P.M. of the generator armature of 25 M.P.H. car speed in high gear.

Plate No. 1231

BATTERY:—Willard, Type SJRR-3. 6 volt, 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-S. Distributor Model 626-K. Breaker contacts separate .020-.025 inch. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. The distributor is of the full automatic type. Automatic advance is 25°.

Mounting:—Distributor is mounted at right of engine.

Oiling:—Screw up the grease cup under the breaker head one-half turn every two weeks.

If the car is driven more than 500 miles in two weeks, this must be done every 500 miles. Put 3 or 4 drops of light engine oil in the wick in the breaker lever spindle every six months.

Timing:—Breaker contacts begin to separate when the flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To adjust timing, loosen the nut on top of the breaker cam and pry up the cam with a screw driver. Then rotate the cam in a counter-clockwise direction until the contacts begin to separate. Tighten the nut. A fine adjustment can be made by loosening the screw on the breaker plate and rotating the plate, a graduated scale being provided to gauge the movement. Tighten the screw after making the adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; tappet clearance, .006 (hot); valve lift, 19/64 inch; intake opens at 5° past top dead center and closes at 35° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inch; tappet clearance, .006 inch (hot); valve lift, 19/64 inch; exhaust opens at 40° before lower dead center and closes at 10° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 720-N. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24-28 ounces. Starter switch is Model 400-B.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 lb. ft.	Lock	3.2	575

Mounting:—Starter is mounted at left of engine. To remove starter remove three flange mounting screws and withdraw starter from position.

Oiling:—Put 4 or 5 drops of light engine oil in the bearing oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 941-K. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. A thermostat in the shuntfield circuit cuts a resistance into the field at 165°F. reducing the output to 9-12 amperes. To adjust charging rate, loosen the small round-headed screw on the generator end plate and shift the third brush. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment.

BATTERY:—Willard, Type SJRR-3. 6 volt, 90 ampere hour. The positive (+) terminal is grounded.

IGNITION:—Coil Model K-789. Distributor Model K-815. The breaker contacts separate .020-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Mounting:—Distributor is mounted at the right of the engine.

Oiling:—Put 4 or 5 drops of light engine oil in each of the oilers on the side of the distributor housing. Lift the spring arm on top of the breaker arm pivot and put 2 or 3 drops of light engine oil on the felt wick exposed. Remove the rotor and put several drops of oil in the oiler in the center of the breaker cam. These attentions must be given every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the mark on the flywheel "UP-DC" 1-6" is opposite the pointer on the right side of the flywheel housing, with the breaker or assembly in the fully retarded position. To set timing, loosen screw in center of breaker cam and shift cam until the contacts begin to separate. Then tighten the screw. Provision is made for accurate setting by loosening the screw on the breaker plate and rotating the plate. A graduated scale is provided to gauge the setting. Tighten the screw after making the adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; tappet clearance, .006 (hot); valve lift, 19/64 inch; intake opens at 5° past top dead center and closes at 35° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inch; tappet clearance, .006 inch (hot); valve lift, 19/64 inch; exhaust opens at 40° before lower dead center and closes at 10° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model No. S-533. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter brush pressure should be 1000 grams each.

Starter Data.

BATTERY:—Willard, Type SJRR-4. 6 volt, 111 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 284-S. Distributor Model 626-W. Breaker contacts separate .028 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. The distributor is of the full automatic type. Maximum automatic advance is 28°. Breaker arm spring tension should be 17.5-20.5 ounces.

Mounting:—Distributor is mounted at front of engine.

Oiling:—Fill the oilers on the side of the distributor housing with light engine oil. Remove the rotor and put several drops of oil in the oil hole in the center of the breaker cam. Lift the spring arm on the breaker arm pivot and put 2 or 3 drops of oil on the wick oiler exposed. This oiling must be done every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when flywheel marking UP-DC-1-6 is at the indicator on the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the nut on the top of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to open. Then tighten the nut. For close setting loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/8 inches; tappet clearance, .006 (hot); valve lift, 5/16 inch; intake opens 7° 30 minutes past dead center and closes 37° 30 minutes past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/8 inches; tappet clearance, .006 inch (hot); valve lift, 5/16 inch; exhaust opens at 47° before lower dead center and closes 11° past top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 723-B. Starter is connected to the engine through reduction gears, chain drive and an overrunning clutch. The direction of rotation of the armature is clockwise, looking at the commutator end. Sprocket shaft rotation is clockwise, viewed from drive end. Starter brush tension is 24-28 ounces each. Starter switch is Model 406-A, B.

Torque	Volts	Amperes	R.P.M.
0	5	70	1000
70	3.25	600	Lock

Torque and R.P.M. in each case measured at sprocket shaft.

Mounting:—Starter is mounted at right front of engine and drives through a chain and sprocket drive and overrunning clutch to the forward end of the crankshaft. Mounting is by special bracket to the engine block.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once every three months lubricate the starter clutch with light engine oil applying through the oiler provided. Remove the grease plug in the reduction gear case and repack the gears with graphite grease once each year.

GENERATOR:—Model 941-L. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. A thermostat is located in the shunt field circuit. Thermostat contacts open at 165°F. cutting a resistance into the field circuit and reducing the output to 9-12 amperes. To adjust generator output, loosen the small round-headed screw on the generator end plate and shift the third brush. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment.

10-12		2500			

Shuntfield current is 5 amperes at 6 volts. Generator brush spring tension is 14-18 ounces each.

Mounting.—Generator is vertically mounted at right front of engine. To remove generator, remove three flange mounting screws and lift unit from place.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model 266-E. Relay is mounted on the dash. Relay closes at 8-10 M.P.H. when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21-21 cp. double filament using second 21 cp. filament for dimming. Side lamps are 6-8 volt, 6 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Tonneau, stop and dome lamps are each 6-8 volt, 4 cp. S.C.

Switches.—Lighting switch mounted on steering column is Model 420-K. Ignition switch is Model 440-A. Starting switch is Model 406-A or B.

FUSES.—Lighting fuses mounted on junction block are 10 amperes.

WAGNER GENERATING, STARTING AND LIGHTING SYSTEM
WAGNER IGNITION

BATTERY:—Willard, Type SJRR-4. 6 volt, 111 ampere hour. The starting capacity is 125 amperes for 20 minutes. The lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model K-789. Distributor Model K-889. Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Distributor is of the full automatic type. Automatic advance begins at 400 R.P.M. and reaches a maximum of 25° at 2200 R.P.M. of the engine. The tension of the breaker arm spring should be 325 grams.

Mounting:—Distributor is mounted at front of engine.

Oiling:—Fill the oilers on the side of the distributor housing with light engine oil. Remove the rotor and put several drops of oil in the oil hole in the center of the breaker cam. Lift the spring arm on the breaker arm pivot and put 2 or 3 drops of oil on the wick oiler exposed. This oiling must be done every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the flywheel marking "UP-DC-1-6" is opposite the indicator on the left side of the flywheel housing with the breaker assembly in the fully retarded position. To set timing, loosen the screw in the center of the breaker cam and rotate the cam in a counter-clockwise direction until the contacts begin to separate. Then tighten the screw. For close setting, loosen the screw on the breaker mounting plate and rotate the plate. A graduated scale is provided for accurate movement. Tighten the screw after making the adjustment.

Valve Timing:—**INLET VALVES:**—Head diameter, 1 $\frac{7}{8}$ inches; tappet clearance, .006 (hot); valve lift, 5/16 inch; intake opens 7° 30 minutes past dead center and closes 37° 30 minutes past lower dead center.

EXHAUST VALVES:—Head diameter, 1 $\frac{7}{8}$ inches; tappet clearance, .006 inch (hot); valve lift, 5/16 inch; exhaust opens at 47° before lower dead center and closes 11° past top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .025 inch.

STARTER:—Model No. S-503. Starter is mounted at front of the engine and is connected to the crankshaft through a sprocket and chain. An over-running clutch is provided to prevent the engine driving the starter. The direction of rotation is clockwise, looking at the commutator end.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1000	5.8	67
75 "	Lock	3.2	530

The starter brush pressure should be 1000 grams each.

Mounting:—Starter is mounted at right front of engine and drives to the forward end of the crankshaft. Mounting is by a special bracket to the engine block.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month. Once every three months lubricate the starter clutch with light engine oil applying through the oiler provided. Remove the grease plug in the reduction gear case and repack the gears with graphite grease once each year.

GENERATOR:—Model S-602. The direction of rotation is counter-clockwise, looking at the commutator end. The generator is mounted vertically at the forward end of the engine. Current regulation is by the third brush system. The third brush mounting plate is held in position by a screw in the generator end plate. To increase the charging rate, move the third brush in the direction of generator rotation and in the opposite direction to decrease the charging rate.

Generator Data.		
Amperes	Volts	R.P.M.
0	7.2	580
10	7.25	1000
16	8.1	1500
8.5	7.65	3000

Operating freely as a motor, generator makes 300 R.P.M. taking 5 amperes at 6 volts. The brush pressure should be 550 grams each.

Mounting.—Generator is vertically mounted at right front of engine. To remove generator, remove three flange mounting screws and lift unit from position.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY.—Model K-880. Relay contacts close at 580 R.P.M. with a generator voltage of 7.2 volts and open with a discharge current of 0.4 amperes. Contacts separate .035 inch. The air gap between the relay armature and coil core is .025 inch, contacts closed.

LIGHTING.—Head lamps are 6-8 volt, 21-21 cp. double filament using second 21 cp. filament for dimming. Side lamps are 6-8 volt, 6 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Tonneau, stop and dome lamps are each 6-8 volt, 4 cp. S.C.

Switches.—Lighting switch mounted on steering column is Model 420-K. Ignition switch is Model 440-A. Starting switch is Model 406-A or B.

FUSES.—Lighting fuses mounted on junction block are 10 amperes.

CHRYSLER

MODEL G (70) (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type CWR-15. 6 volt, 100 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 656-F. Breaker contacts separate .022 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat jeweler's file. Distributor is of the semi-automatic type. Manual advance is 25°. Automatic advance is 15° at maximum. Breaker arm spring tension is 17.5-20.5 ounces. Distributor uses two sets of breaker contacts operating on a three sided cam and opening alternately. The opening of the second set of contacts must be correctly set (see timing).

Mounting:—Distributor is mounted on top of cylinder block. To remove distributor, disconnect coil lead and high tension cables or remove distributor head. Then disconnect manual advance rod and remove manual advance stop screws. Lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .087 inch before top dead center with the spark advance lever in the fully advanced position. To set timing first check both sets of contacts for proper timing interval. Use special factory tool to set breakers to open at intervals of 60° corresponding to 120° of crankshaft rotation. Then crank engine until piston No. 1 entering power stroke is .087 before top dead center. Loosen the lock screw holding distributor cam and rotate cam until stationary contacts begin to separate. Tighten the screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 11/32 inch; stem length, 5 9/16 inches; tappet clearance, .004 inch; spring pressure, 75-80 pounds; valve lift, 5/16 inch; inlet opens 6° after top dead center and closes 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 11/32 inch; stem length, 5 9/16 inches; tappet clearance, .006 inch; spring pressure, 75-80 pounds; valve lift, 5/16 inch; exhaust opens 42° after lower dead center and closes 8° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .027-.030 inch.

STARTER.—Model 724-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 144 R.P.M. taking 157 amperes at 5.27 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
Torque	R.P.M.	Volts	Amperes

12.0 "	350	4.0	400
16.5 "	150	3.5	500
22.5 "	Lock	3.0	600

Mounting:—Starter is mounted on forward side of flywheel housing at left of engine. To remove starter, disconnect starter cable and remove large pilot mounting screw and lock nut. Then slide starter forward and lift from place.

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oiler every month or each 1000 miles.

Continued on reverse side.

CHRYSLER

MODEL G (70) (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR.—Model 941-C. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165° F. cutting a resistance into the shunt field circuit and reducing the output approximately 50%. To adjust the charging rate loosen the small round headed screw on the generator end plate and shift the third brush mounting bracket. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 22-28 ounces.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

12.....	—.....	2800			

Mounting:—Generator is mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove three flange mounting nuts. Then slide generator to rear, being careful to leave intermediate flange in place. If this is not done the timing chain will slip, affecting the valve timing.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY.—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 675 R.P.M. of the generator armature when the voltage reaches 7.2 volts and open with a discharge current of 0.3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Remy Switch No. 819265. Head lamps are 6-8 volt, 21 cp. double filament, using second 21 cp. bulb for dimming. Dash and tail lamps are 6-8 volt, 3 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Stop and backing lamps are 6-8 volt, 15 cp. S.C.

FUSES:—Lighting fuses are 30 amperes.

ACCESSORIES:—The gasoline gauge is connected to the ignition line at the ignition coil.

LEXINGTON

"CONCORD" MODEL W (1927)

Serial Nos. 50,000 Up.

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM CONNECTICUT IGNITION

BATTERY:—Willard, CWR-15, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the front floor boards on the left hand side.

IGNITION:—Coil Model 225-Y. Breaker contacts separate .012-.015 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file.

Mounting:—Coil is mounted at front of engine on the left side. Distributor is mounted at left of engine near front. To remove distributor, disconnect breaker lead and manual control rod. Remove distributor head or disconnect spark plug cables. Then remove wing nut on clamping stud and lift breaker assembly from place.

Oiling:—Refill the cup under the distributor head with vaseline and turn down every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate with piston No. 1 entering power stroke when the flywheel marking is two teeth past the top dead center mark on the flywheel case. The spark control lever and breaker assembly must be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ inch. Gaps are .020 inch.

STARTER:—Model 942. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be $1\frac{3}{4}$ -2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000		60
12 "	Lock	4	450

Armature air gap is .014-.024 inch. Armature resistance at 70°F is .0031 ohms. Field resistance at 70°F is .0035 ohms.

Mounting:—Starter is mounted at right of engine by flange mounting to the flywheel case. To remove starter, disconnect starter cable and remove three flange mounting screws. Then slide starter from place.

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Model 1051. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the charging rate, insert a special Bosch key in the hole on the generator end plate and shift the third brush by turning the key. The third brush mounting bracket may be shifted by hand after the commutator cover band has been removed. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate of 13-14 amperes is reached at 1500-1600 R.P.M. of the generator armature.

MODEL 96 (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

WHIPPET
Model 96 (1927)
Auto-Lite System

Plate No. 1237

BATTERY:—U.S.L. Type 3-CVX-5X-6, 6 volt. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. The battery is mounted on the chassis under the front floor board.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4135-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is of the manual type.

Mounting:—Ignition coil is mounted on right side of engine. Distributor is mounted at rear of generator on right side of engine. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then loosen two clamp screws in mounting bracket on generator end plate. Then lift distributor from place.

Oiling:—Put 5 to 8 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Put one drop of oil on the breaker arm pivot pin and put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the breaker arm every 5000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 28° before top dead center (measured on the flywheel) with the manual spark control lever in the fully advanced position. Intake opens at top dead center and closes at 40° past lower dead center. Exhaust opens at 46° before lower dead center and closes at top dead center.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MO-4105. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M. taking 150 amperes at 5 volts. Starter brush tension should be 1¼-1½ pounds each. Starter switch is Model SW-4001.

Starter Data

Torque	R.P.M.	Volts	Amperes
1.5 lb. ft.	2080	5.25	150
2.5 "	1480	5.0	200
3.5 "	1090	4.7	250

5.9 "	500	4.3	350
7.0 "	220	4.0	400
11.6 "	Lock	4.0	550

Mounting:—Starter is flange mounted on right side of engine at forward side of fly-wheel housing. To remove starter, disconnect starter cable and remove three flange mounting screws. Then slide starter forward and lift from place.

Oiling:—Starter bearings are graphite-bronze self oiling type. They require no attention.

GENERATOR:—Model GTB-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove commutator cover band and shift third brush mounting bracket by prying on third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any desired position by friction between the third brush mounting stud and the generator end plate. The maximum charging rate is 16 amperes reached at 1800 R.P.M. of the armature or approximately 25 M.P.H.

Running as a motor, generator draws 5 amperes at 6 volts. Shuntfield current is 3.6 amperes at 6.2 volts. Generator brush tension should be 1¼-1½ pounds each.

Mounting:—Generator is mounted on right side of engine at rear of timing chain case by an eccentric mounting which permits adjustment of the chain. To remove generator, disconnect generator lead and all ignition leads or remove distributor from mounting bracket. Then remove chain case cover on forward side and remove nut on generator drive sprocket. Remove generator mounting strap and slide generator to rear allowing sprocket to remain meshed in chain. Remove generator from place.

Oiling:—Put 8 to 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the timing chain.

RELAY:—Model CB-4007. Relay is mounted on the generator. Relay closes at approximately 11 M.P.H. when the generator voltage reaches 7-7.5 volts and opens at approximately 9 M.P.H. with a discharge current of .5-2.5 amperes. Charging current must not exceed 5 amperes when contacts close. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.020 inch, contacts closed.

LIGHTING:—Briggs & Stratton Switch Model 38200. Head lamps are 6-8 volt, 21 cp. S.C. Dimming is by .5 ohm resistance on switch. Dash, dome and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

GARDNER MODEL 6-B (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 611-SHK. 6 volt, 92.5 ampere hour. The starting capacity is 110 amperes for 20 minutes. The lighting capacity is 5 amperes for 18.5 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 284-P. Distributor Model 636-H. Breaker contacts separate .020-.028 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25°. Maximum automatic advance is 30°. The tension of the breaker arm spring is 17-21 ounces.

Oiling:—Screw up the grease cup on the side of the distributor housing one or two turns every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of vaseline on the face of the breaker cam and oil the wick oiler under the rotor with light engine oil every 5000 miles.

Timing:—Breaker contacts begin to separate when the top dead center mark on the flywheel reaches a position 10° or approximately one inch past the mark on the flywheel housing. The manual spark advance lever should be in the fully retarded position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER.—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24 ounces.

Starter Data.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 " "	Lock.	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR.—Model 941-D. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system combined with a thermostat. The thermostat contacts open at approximately 160° inserting a resistance in the shunt field circuit and cutting down the output 50%. To adjust the generator output, loosen the screw on the generator end plate and shift the third brush mounting plate. Moving the third brush in the direction of generator rotation increases the charging rate and in the opposite direction decreases the charging rate. The maximum charging rate of 18-20 amperes is reached at 1450 R.P.M. or approximately 25 M.P.H.

Generator Data.

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.3	750			
21	8.35-8.5	1450	11	7.5	1900

The brush tension should be 22-28 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model No. 265-B. Relay contacts close at 675 R.P.M. of the generator armature with a generator voltage of 7.25 volts. Charging current at closing of contacts is 3 amperes. Contacts open with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING.—Combination Switch Model 420-H. Head lamps are 6-8 volts, 21 cp. S. C. Side, tail and dash lamps are each 6-8 volt, 3 cp.S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dome lamp is 6-8 volt, 4 cp.D.C.

FUSES:—Lighting fuses are 20 ampere.

OLDSMOBILE

MODEL E-30 (1927) AFTER FIRST 12,000 CARS DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

OLDSMOBILE
Model E-30 (1927)
Delco-Remy System

Plate No. 1239

BATTERY:—Willard, Type XW-13, 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 2198. Distributor Model 637-T. Breaker contacts separate .022-.025 inch. They are made of tungsten. When the condition of the contacts affects the ignition remove and resurface on a medium hard oilstone or with a fine, flat contact file. Distributor is of the full automatic type, with 25° engine advance. The tension of the breaker arm spring should be 15 to 20 ounces. Ignition coil is of the new type with switch and lock in the coil. It is mounted on the back of the instrument board with the switch extending through to the face of the instrument panel. The ignition switch cannot be turned "on" until it has been unlocked and the key removed. Turning the switch "off" automatically locks the ignition.

Mounting:—Distributor is mounted on the rear of the generator. To remove distributor, loosen timing adjustment clamp screw. Then lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in oiler on side of the distributor every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position of .020-.030 inch before top dead center. To time engine, loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Then tighten the screw to hold the adjustment. Make certain that the rotor is under the segment connected to the spark plug in the cylinder firing.

Valve Timing:—INLET VALVES:—Head diameter, 1 3/8 inches; stem diameter, 5/16 inch; stem length, 5 9/32 inches; tappet clearance, .005 inch; spring pressure, 60 pounds; valve lift, .283 inch; intake opens at top dead center and closes 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/8 inches; stem diameter, 5/16 inch; stem length, 9/32 inch; tappet clearance, .005 inch; spring pressure, 60 pounds; valve lift, .283 inch; exhaust opens at 35° before lower dead center and closes at 5° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025-.030 inch.

STARTER:—Model 713-G. The starter is connected to the engine through an inboard Bendix R-11-X. The direction of rotation is clockwise, looking at the commutator end. Starting switch is Model 406 D. Starter brush tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lbs. ft.	5000	5	65
12 "	Lock	3.63	475

Oiling:—Starter bearings are oilless. They require no attention.

Mounting:—Starter is sleeve mounted at left of engine on clutch housing. To remove starter remove large pilot mounting screw and slide starter from place.

GENERATOR:—Model 940-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system, combined with a thermostat. To adjust generator output, loosen the round-head screw on the outside of the commutator end bracket. Then shift third brush in a counter-clockwise direction to increase the charging rate and opposite direction to decrease the charging rate. The generator brush tension is 14 to 18 ounces.

OLDSMOBILE

MODEL E-30 (1927) AFTER FIRST 12,000 CARS

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Thermostat opens at 162°F. with 75 ohms resistance.

Mounting:—Generator is flange mounted at front right of engine and driven by timing chain. To remove generator, remove three flange mounting screws and slide generator to rear, taking care that timing chain does not slip off sprocket.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every 500 miles. Every six months remove the plug in the distributor gear case and replenish with medium cup grease.

RELAY:—Model 265-B. Relay is mounted on top of generator. Contacts open with a discharge current of 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .018-.022 inch; contacts closed.

LIGHTING:—Lighting Switch Model 1303. Switch is mounted at base of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament for dimming. Side, dash, dome and tail lamps are each 6-8 volt, 3 cp. Stop light is 6-8 volt, 15 cp.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the dash. It is in the lighting switch lead and protects the lighting lines. A current of 25-35 amperes will cause the circuit breaker to vibrate limiting the current flow to 10-15 amperes.

Plate No. 1239A

BUICK

1927

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Exide, 3-XC-13-1, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The negative (—) terminal is grounded. Exide, Type 3-XC-15-1, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded. Battery is located on right side under floor boards.

IGNITION.—Coil Model 2188. Distributor Model 17046. Breaker contacts separate .015-.0225 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone or with a fine, flat jeweler's file. The distributor has both manual and automatic advance. Automatic advance begins at 450 R.P.M. and reaches a maximum of 15-19° at 2200 R.P.M. Manual advance is 25°. The breaker arm spring tension is 16-20

Mounting.—Distributor is mounted on the rear of the generator at the right of the engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from its mounting.

Oiling.—A Zerk oiler is located on the side of the distributor shaft housing. Give this a charge from the pressure gun every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing.—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position at which the 17° mark on the flywheel is opposite the indicator on the flywheel case. This is 17° before top dead center. The manual advance lever must be in the fully advanced position. To set timing remove the plug at the bottom of the distributor shaft housing and loosen the timing adjustment screw. Then rotate the breaker cam until the contacts begin to separate. Tighten the screw after making the adjustment.

Valve Timing.—INLET VALVES.—Head diameter, 1 7/8 inches; stem diameter, 3/8 inch; stem length, 6 1/8 inches; tappet clearance, .008 inch (hot); valve lift, 21/64 inch; intake opens at 25° 50 minutes before top dead center and closes 81° 23 minutes past lower dead center.

EXHAUST VALVES.—Head diameter, 1 5/8 inches; stem diameter, 3/8 inch; stem length, 6 1/8 inches; tappet clearance, .008 inch (hot); spring pressure, 56 to 68 pounds (valve closed); valve lift, 5/16 inch; exhaust opens at 101° 36 minutes before lower dead center and closes 45° past top dead center. Stem guides are removable. Oversize valve stems are made.

NOTE.—On 114 1/2 inch wheel base model, head diameter is 1 7/16 inches; and stem length is 5 5/8 inches.

Firing Order.—The firing order is 1-4-2-6-3-5.

Spark Plugs.—Spark plug diameters are 7/8 inch. Gaps are .020 inch.

STARTER.—Model 316. Starter is connected to the engine through a mechanically operated pinion shift incorporated in the starting switch and an overrunning clutch which prevents the engine driving the starter. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 2 1/4-2 1/2 pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6.0	60
1.5 "	1800	4.9	150
2.5 "	1400	4.7	200
5 "	825	4	300
18.25 "	Lock	3.2	500

Mounting.—Starter is mounted at right of engine by flange mounting. To remove starter, disconnect pedal return spring and pedal rod and remove three flange mounting screws. Then slide starter forward and lift from place.

Oiling.—Starter bearings are self oiling. They require no attention.

Continued on reverse side.

GENERATOR.—Model 317. The direction of rotation is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system. To adjust the output, remove the generator cover band and shift the third brush by means of the handle on the third brush mounting plate. Moving the third brush in the direction of armature rotation increases the charging rate and in the opposite direction decreases the charging rate. The mounting plate is held in any desired position by friction clamp washers. The maximum charging rate of 18 amperes is reached at 1700 R.P.M. of the generator or 25 M.P.H.

Generator Data					
Cold Test (75° F.)			Hot Test (170° F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4.....	6.8.....	700			
7.....	7.1.....	750			
10.....	7.4.....	940	13.....	7.6.....	1800
18.....	8.3.....	1700			
8.....		3000			

Motoring freely at 300 R.P.M. generator draws 4.5-5 amperes at 6 volts. Shunt field current is 3 amperes at 6 volts. Generator brush tension should be 1¼-1¾ pounds each.

Oiling.—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. The drive end is oiled by splash from the timing gear case.

Mounting.—Generator is mounted at right of engine. To remove generator, drain radiator, disconnect pump coupling and remove water pump. Then remove three flange mounting screws and slide generator to rear.

RELAY.—Model 5766. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. of the generator at 8 M.P.H. with a generator voltage of 7.5 volts and open at 580 R.P.M. or 6 M.P.H. with a discharge current of 0-2 amperes. Charging current at closing of contacts is 1-2 amperes. Relay contacts separate .012 inch. Air gap between relay armature and coil core is .009-.010 inch, contacts closed.

LIGHTING.—Head lamps are each 6-8 volt, 21 cp. They are double filament, the second filament being used for dimming and controlled by a dimmer switch on the steering column. Dash and side lamps are 6-8 volt, 3 cp. S.C. Tail lamp is 6-8 volt, 3 cp. D.C.

Switches.—Dimmer switch is Model 1290. Combination switch on Standard Six is Model 1288. Combination switch on the Master Six is Model 1289.

CIRCUIT BREAKER.—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

ESSEX

SIX (LATE 1926) (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Pres-O-Lite, Type 6-13-JFK, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CE-4001. Distributor Model IB-4001. Breaker contacts separate .018-.022 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is automatic. Advance starts at 500 engine R.P.M. and reaches maximum of 9.6° at 2800 R.P.M.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put one drop of light engine oil on the breaker arm pivot pin every week or each 250 miles and place a small bit of vaseline on the face of the breaker cam under the fiber bumper every 5000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches top dead center. At this point the flywheel marking will be opposite the indicator on the flywheel case.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Metric Standard. Gaps are .025 inch.

STARTER:—Model MU-4001A. Starter is connected to the engine through a special Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 1¾-2¼ pounds each. Starter cranks the engine at 125 R.P.M., taking 150 amperes at 5.6 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	6	50
2 "	1500	5.2	160
4 "	900	4.8	240
6 "	450	4.4	320
10 "	Lock	3.6	500

Starter switch model is MU-2208.

Oiling:—Starter bearings are oilless graphite-bronze. They require no attention.

GENERATOR:—Model GAA-4001. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, remove the commutator cover band and shift the third brush mounting bracket by tapping on the mounting lug with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting bracket is held in any desired position by friction between the mounting lug and the generator end plate. The maximum charging rate of 12.5 amperes is reached at 1450 R.P.M. of the generator.

Generator Data

Cold Test (68°F)			Hot Test (203°F)

ESSEX
SIX (LATE 1926) (1927)
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION

Continued from preceding page

Shuntfield test current is 3.5-4 amperes at 6 volts. Each coil when tested separately draws 14-16 amperes at 6 volts. Generator brush tension is $1\frac{1}{2}$ - $1\frac{3}{4}$ pounds each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—No relay is used. The generator is connected directly to the battery through the ignition switch when the ignition is "on." With engine off and ignition switch open the generating circuit is broken up, preventing the battery discharging through the generator windings.

LIGHTING:—Clum Switch Model XA-319. Head and stop lamps are each 6-8 volt, 21 cp. S.C. Dash and tail lamps are connected in series. They are each 3-4 volt, 2 cp.

FUSES:—Lighting fuse mounted on switch is 20 amperes.

HUDSON

SUPER-SIX (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Prest-O-Lite, Type 6-15-JFK, 6 volt. Starting capacity is 120 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CE-4001. Distributor Model IGA-4011. Breaker contacts are set to separate when new at .020-.024 inch; after 800 to 1000 miles operating contacts should be checked and set, if necessary, at .018-.020 inch. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put one drop of oil in the breaker arm pivot pin every week or each 250 miles. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper every 5000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches a position when the flywheel marking "A" is opposite the mark on the fly-wheel case. The manual advance lever must be in the fully advanced position.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Metric standard. Gaps are .025 inch.

STARTER:—Model MUA-4001 (R.H. Drive), Model MUA-4002 (L.H. Drive). Starter is connected to the engine through a sliding gear shift built in the starting switch. Pressing down on the starting pedal meshes the gears and closes the starting switch. When the pedal is released a spring reverses these operations. Starter brush tension should be 1 3/4-2 1/4 pounds each. Starter cranks the engine at 110 R.P.M. taking 250 amperes at 5.5 volts.

Starter Data

Model MUA-4001

17.....	8.0.....	1300	11.....	7.8.....	2000
13.....	7.8.....	1950			

Motoring freely at 355-390 R.P.M. generator draws 4.7-5.2 amperes at 6 volts. Shunt field current is 6.1-6.8 amperes at 6 volts. Tested separately each coil draws 24.4-27.2 amperes at 6 volts. Generator brush tension should be 1.0-1.5 pounds. Generator GAB 4008 has a $7\frac{1}{2}$ ampere field fuse mounted on top of generator just forward of commutator end head. It also carries a circuit breaker mounted on top of the generator just forward of the field fuse. (Further data on relay is given under RELAY.)

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—On generator GAB 4001 no relay is used. The generator is connected to the battery through the ignition switch. With engine stopped and ignition switch on battery discharges through generator windings.

On generator GAB 4008 relay model CB-4014 is used. Relay closes at 545-620 generator R.P.M. at 7.9 volts. Charging current at closing of contacts not over 5 amperes. Contacts separate .025-.035 inch. Air gap is .010-.030 inch with points closed.

LIGHTING:—Clum Switch Model 10643. Auto-Lite No. XA-319. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Side, dash and tail lamps are each 6-8 volt, 3 cp. S. C.

FUSES:—Lighting fuse mounted on switch is 20 amperes.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

GARDNER
Model 80 (1927)
Delco-Remy System

Plate No. 1244

BATTERY:—Prest-O-Lite, Type 613-RHK. 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted on the frame at the right under the front floor board.

IGNITION:—Coil Model 550-A. Distributor Model 658-B. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Distributor is of the semi-automatic type. Manual advance is 15° (engine). Automatic advance begins at 500 R.P.M. and reaches the maximum of 17.5° (engine) at 2000 R.P.M. Double breaker contacts are used. They open at intervals of 45° corresponding to 90° of crankshaft rotation. The second set of contacts must be checked to see that they open at the proper instant (see timing). Ignition current is .6-2.5 amperes with engine running and 4.5 amperes with engine stopped. The tension of the breaker arm spring should be 17-21 ounces.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor and saturate the wick oiler exposed with light engine oil. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the dead center mark for cylinders 1 and 8 on the flywheel is 5° past top dead center. At this point piston No. 1 will be slightly past top dead center entering power stroke. To set timing, fully retard manual spark control lever and crank engine until piston No. 1 on compression stroke reaches top dead center. This is the upstroke with both valves closed. At this point the dead center mark on the front flywheel will be opposite the mark on the chain case cover. Then crank the engine over 5°. Loosen the lock nut on the breaker cam and rotate the cam until stationary contacts begin to separate. Tighten the locknut. The other set of contacts open 45° after this point. They can be checked by special tool issued by distributor manufacturer.

Valve Timing:—INLET VALVES:—Head diameter, 1 3/8 inches; stem diameter, 11/32 inch; stem length, 5 7/8 inches; tappet clearance, .006 inch (hot); spring pressure, 50 pounds (closed); valve lift, 11/32 inch; intake opens at 5° past top dead center and closes 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 11/32 inch; stem length, 5 7/8 inches; tappet clearance, .008 inch (hot); spring pressure, 50 pounds (closed); valve lift, 11/32 inch; exhaust opens at 47° before lower dead center and closes on top dead center. The stem guides are removable. Oversize valve stems are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

STARTER:—Model 716-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise looking at the commutator end. Starter brush tension should be 24-28 ounces. Starter switch is Model 406-D.

19-21	8.5	1450	9-12	7.5	2000

Shuntfield current is 4 amperes at 6 volts. Generator brush spring tension is 24-28 ounces.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oiler every 1000 miles.

RELAY:—Model No. 265-B. Relay is mounted on the end of the frame. Relay contacts close at 675 R.P.M. of the generator armature or 6-7 miles per hour with a generator voltage of 6.57 volts. Contacts open with a discharge current of 2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Remy Lighting Switch Model 420-Q. Head lamps are 6-8 volt 21-21 cp. double filament twin beam D.C. Auxiliary head lights are 6-8 volt 3 cp. S.C. Tail and dash lamps are each 6-8 volt 2 cp. S.C.

FUSES:—Lighting Fuses are 10 amperes.

GARDNER

MODEL 90 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 617-RHK. 6 volt, 135 ampere hour. The starting capacity is 152 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 550-A. Distributor Model 658-A. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine, flat contact file. Distributor is of the semi-automatic type. Manual advance is 15° (engine). Automatic advance begins at 500 R.P.M. and reaches the maximum of 17.5° (engine) at 2000 R.P.M. Double breaker contacts are used. They open at intervals of 45° corresponding to 90° of crankshaft rotation. The second set of contacts must be checked to see that they open at the proper instant (see timing). Ignition current is .6-2.5 amperes with engine running and 4.5 amperes with engine stopped. The tension of the breaker arm spring should be 17-21 ounces.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor and saturate the wick oiler exposed with light engine oil. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the dead center mark for cylinders 1 and 8 on the flywheel is 5° past top dead center. At this point piston No. 1 will be slightly past top dead center entering power stroke. To set timing, fully retard manual spark control lever and crank engine until piston No. 1 on compression stroke reaches top dead center. This is the upstroke with both valves closed. At this point the dead center mark on the front flywheel will be opposite the mark on the chain case cover. Then crank the engine over 5°. Loosen the lock nut on the breaker cam and rotate the cam until stationary contacts begin to separate. Tighten the locknut. The other set of contacts open 45° after this point. They can be checked by special tool issued by distributor manufacturer.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; tappet clearance, .006 inch (hot); spring pressure, 36 pounds (closed); valve lift, 5/16 inch; intake opens at top dead center and closes 35° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/16 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; tappet clearance, .008 inch (hot); spring pressure, 36 pounds (closed); valve lift, 5/16 inch; exhaust opens 42° before lower dead center and closes 5° after top dead center. The stem guides are removable. Oversize valve stems are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise looking at the commutator end. Starter brush tension should be 24-28 ounces. Starter switch is Model 406-D.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lbs. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the starter every 1000 miles.

GENERATOR:—Model 941-D. The direction of rotation of the generator is counter-clockwise looking at the commutator end. Current regulation is by the third brush system, combined with a thermostat. The thermostat contacts open at 150° F. To adjust the generator output, loosen the screw on generator end plate and shift the

Shuntfield current is 4 amperes at 6 volts. Generator brush spring tension is 24-28 ounces.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oiler every 1000 miles.

RELAY:—Model No. 265-B. Relay is mounted on the end of the frame. Relay contacts close at 675 R.P.M. of the generator armature or 6-7 miles per hour with a generator voltage of 6.57 volts. Contacts open with a discharge current of 2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .014 inch, contacts closed.

LIGHTING:—Remy Lighting Switch Model 420-Q. Head lamps are 6-8 volt 21-21 cp. double filament twin beam D.C. Auxiliary head lights are 6-8 volt 3 cp. S.C. Tail and dash lamps are each 6-8 volt 2 cp. S.C.

FUSES:—Lighting Fuses are 10 amperes.

PAIGE

MODELS 6-65 AND 6-75 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM ATWATER KENT IGNITION

BATTERY.—Westinghouse, Type 6-OB-13. 6 volt, 115 ampere hour. The starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 19 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Type N-3. Distributor Type L. A. Breaker contacts separate .015 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance is 24°.

Oiling.—Fill the oil cup under the distributor head with light cylinder oil every two weeks or each 500 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber block on the breaker arm every month.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 11° 28' after top dead center with the manual spark control lever and breaker assembly in the fully retarded position. This position is approximately 13/8 inches past top dead center, measure on the flywheel. With piston No. 1 entering power stroke the flywheel marking "EXCL.1-6" will be approximately opposite the indicator.

Valve Timing:—INLET VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; stem length, 6 inches; tappet clearance, .006 inch (hot); spring pressure, 50-55 pounds; valve lift, 5/16 inch; intake opens on top dead center and closes 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; stem length, 6 inches; tappet clearance, .010 inch (hot); spring pressure, 50-55 pounds; valve lift, 5/16 inch; exhaust opens 40° before lower dead center and closes 10° after top dead center. The guide stems are removable. Oversize valve stems are made.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plugs are 7/8 S.A.E. Standard. Gaps are .025 inch.

STARTER.—Model 713-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M. taking 125 amperes. Starter brush tension is 24-28 ounces each. Starter switch is Model 404-L.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.6	475

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every two weeks or each 500 miles.

GENERATOR.—Model 941-P. (On Model 6-65) Model 917-ZA. (Model 6-75).—The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, remove the commutator cover band and loosen the small screw on the generator end plate holding the third brush mounting plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. There is a thermostat in the shunt field circuit. The thermostat contacts open at approximately 165° F. and reduce the output 40-50%.

Motoring freely, generator draws 5 amperes at 6 volts. The shunt field current is 5 amperes at 6 volts. Brush tension is 24-28 ounces on the Model 941-P and 22-28 ounces on the Model 917-ZA generator.

Continued on reverse side.

PAIGE
MODELS 6-65 AND 6-75 (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
ATWATER KENT IGNITION

Continued from preceding page.

Oiling.—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY.—Model 265-B. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. of the generator when the voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2-3 amperes. Contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING.—Switch Model 420-F. Head and stop lamps are 6-8 volt, 21 cp. S.C. Side lamps are 6-8 volt, 3 cp. S.C. Dash lamp is 6-8 volt, 2 cp. D.C. Tail lamp is 6-8 volt, 2 cp. S.C.

FUSES.—Generator field fuse is 6 amperes on the Model 941-P generator and 5 amperes on the Model 917-ZA generator. Lighting fuses on switch are 10 amperes.

DODGE BROTHERS

1927

NORTHEAST GENERATING, STARTING AND LIGHTING SYSTEM NORTHEAST IGNITION

BATTERY.—Willard, Type SJRR-4. 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 21 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Type 17,232. Distributor Type 10,786. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 20°. Automatic advance is 25°.

Mounting.—Ignition coil is mounted on cylinder head at front of engine. Distributor is mounted at right front of engine. To remove distributor, disconnect manual advance rod and remove distributor head. Then remove set screw and lift distributor from place. This set screw must always be kept tight when the distributor is in operation on the car.

Oiling.—Put a few drops of medium machine oil in the oiler on the side of the distributor housing every 2000 miles. At the same time lift the rotor button from place and put 2 or 3 drops of oil on the felt pad in the center of the breaker cam. Once each season place a small bit of medium heavy grease (No. 4 Keystone or equivalent) on the face of the breaker cam.

Timing.—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8° past top dead center (measured on the flywheel) with the spark control lever in the fully retarded position. To check timing, retard spark lever and crank engine until piston No. 1 enters compression stroke. This is the upward stroke of the piston with both valves closed and may be checked by removing the spark plug and holding the thumb over the opening when the escaping air can be felt. Crank engine until piston reaches top dead center. This point can be checked by observing the flywheel marking through the peephole in the flywheel case. The peephole is on the front of the flywheel case at the right of the engine. The top dead center mark is C/1-4. Then crank engine over 8° until the ignition marking "I" on the flywheel is opposite the mark on the edge of the flywheel case. The breaker contacts should just begin to separate at this point.

To set timing, loosen clamp screw in manual advance rod and turn distributor until oil cup is approximately above advance rod arm. Then tighten clamp screw and loosen mounting set screw. Lift distributor and disengage gears. Then rotate rotor button until it reaches a position just coming into line with segment connected to spark plug in cylinder No. 1. Remesh gears and tighten set screw. Then loosen clamp screw again and turn distributor until breaker contacts just begin to separate. Tighten the clamp screw. With proper setting of contacts breaker contacts will open by rocking the distributor rotor, the back lash of the gears being sufficient for this purpose.

Firing Order.—The firing order is 1-3-4-2.

Spark Plugs.—Spark plugs are S. A. E. Standard 7/8-18. Gaps are .025-.030 inch.

STARTER.—Type 6304-A (Four Brush) Superseded by Type 6304 (Two Brush). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4 pounds each. Starter switch is Model 15380.

Starter Data

Torque	R.P.M.	Volts	Amperes
4 lb. ft.	1200	4.9	220
6 "	900	4.6	280
7 "	600	4.6	350
9 "	300	3.8	430
12 "	Lock	3.4	500

Mounting.—Starter is mounted at left of engine by a Standard S. A. E. No. 2 flange mounting. To remove starter, remove three mounting screws and slide starter forward from place.

Continued on reverse side.

DODGE BROTHERS

1927

NORTHEAST GENERATING, STARTING AND LIGHTING SYSTEM NORTHEAST IGNITION

Continued from preceding page.

Oiling.—Starter bearings are of the oilless type. They require no attention.

GENERATOR.—Model LR, Type 6334, Superseded by Type 6334-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, loosen the screw marked "Lock" on the generator end plate and shift the third brush by turning the other screw marked "Adjust," located near the lock screw on the generator end plate. Tighten the lock screw after making the adjustment. With standard setting, the maximum charging rate is 15-16 amperes (hot) reached at 1200 R.P.M. of the armature or 23-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
8.....	8.....	510	8.....	8.....	620
12.....	8.....	700	12.....	8.....	800

Running as a motor at 600 R.P.M. generator takes 2-3 amperes at 6.25 volts. Shunt field current is 4 amperes at 6.5 volts. Tested separately each coil draws 17 amperes at 5 volts. The brush tension is 1-1¼ pounds. A six ampere fuse is located in the shunt field circuit.

Mounting.—Generator is strap mounted at right of engine. To remove generator, disconnect generator lead and drive coupling. Loosen clamping strap nut and slide generator from place.

Oiling.—Put a few drops of medium oil in the oilers at each end of the generator every 2000 miles.

RELAY.—Type 15850. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7-7.25 volts at approximately 425 R.P.M. or 10 M.P.H. Charging current at closing of contacts is 1-2 amperes. Relay opens with a discharge current of 1-2 amperes. Contacts separate .015 inch. Air gap between relay armature and coil core is .030 inch, contacts closed.

LIGHTING.—Briggs and Stratton Switch Model 40260. Head and stop lamps are each 6-8 volt, 21 cp. S. C. Dash and tail lamps are each 6-8 volt, 3 cp. S. C. Dome lamp is 6-8 volt, 4 cp.

PAIGE MODEL 6-45 (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY.—Westinghouse, Type 6-OB-13. 6 volt, 115 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 19 hours. The positive (+) terminal is grounded.

IGNITION.—Coil Model 525-A. Distributor Model 637-A. Breaker contacts separate .025 inch. They are made of tungsten. Resurface contacts with a fine, flat jeweler's file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance is 20°. The tension of the breaker arm spring is 15-20 ounces. The stationary contact is mounted on a special crescent-shaped arm which moves in same arc as the breaker arm. To adjust contacts, loosen the screw holding the contact mounting arm and turn eccentric adjusting screw until desired contact opening is secured. Then tighten the mounting screw to hold adjustment.

Oiling.—Refill the grease cup under the distributor head and turn down two turns each month or each 1000 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper every month.

Timing.—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position at which the marking "10-1-6" on the flywheel is 1½ inches past the indicator on the flywheel housing. This position is 11° 21' after top dead center. The manual spark control lever and breaker assembly must be in the fully retarded position.

Firing Order.—The firing order is 1-5-3-6-2-4.

Spark Plugs.—Spark plugs are 7/8 S.A.E. Standard. Gaps are .030 inch.

Valve Timing:—INLET VALVES:—Head diameter, 1⅜ inches; stem diameter, 3/8 inch; stem length, 5 13/32 inches; tappet clearance, .006 inch (hot); spring pressure, 50-55 pounds; valve lift, 5/16 inch; inlet opens 4° after top dead center and closes 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1¼ inches; stem diameter, 3/8 inch; stem length, 5 13/32 inches; tappet clearance, .006 inch (hot); spring pressure, 50-55 pounds; valve lift, 5/16 inch; exhaust opens 41° before lower dead center and closes 1° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER.—Model 711-E. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 175 amperes. Starter brush tension is 20-28 ounces. Starter switch is Model 404-U.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4500	5	70
10 "	Lock	3.7	450

Mounting.—Starter is mounted at right of engine by a modified S.A.E. No. 2 flange mounting. To remove starter, remove three mounting screws and slide starter from place.

Oiling.—Put 4 or 5 drops of light engine oil in the starter bearing oilers every month or each 1000 miles.

GENERATOR.—Model 943-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust the generator output, loosen the small round headed screw on the generator end plate and shift the third brush mounting bracket by hand. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 17 amperes is reached at 1600 R.P.M.

BUICK

SERIES 115 AND SERIES 120-128 (Late 1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Exide (Series 115). Type 3-XC-13-1G, 6 volt, 80 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.6 hours. (Series 120-128) Type 3-XC-15-1G, 6 volt, 100 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded. Battery is mounted under front floor boards on right hand frame member.

IGNITION:—Coil Model 2188. Distributor No. 16605. Breaker contacts separate .015-.0225 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 24° (flywheel). Automatic advance begins at 400 R.P.M. and reaches a maximum of 19° (flywheel) at 2200 R.P.M. (crankshaft). Breaker arm spring tension is 16-20 ounces.

Mounting:—Distributor is mounted on the rear of the generator. To remove distributor, disconnect primary lead and manual advance rod. Then remove distributor head with high tension cables intact. Remove manual advance stop screw and lift distributor from place.

Oiling:—Give the Zerk oiler on the side of the distributor housing one charge from the pressure gun every two weeks or each 500 miles. Put a small amount of vaseline on the face of the breaker cam every month.

Timing:—(Series 115-120-128). Breaker contacts begin to separate when the piston entering power stroke reaches a position 17° before top dead center with the spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance the spark control lever and continue to crank engine until the 17° mark on the flywheel is opposite the indicator in the flywheel case. If breaker contacts do not separate at this point, remove the plug at the bottom of the distributor shaft housing and loosen the timing adjustment screw. Then rotate the breaker cam until the contacts begin to separate. Tighten the screw and replace the plug. There is also a 7° mark on the flywheel so that engine can be timed with spark retarded. With manual spark control lever fully retarded the breaker contacts begin to separate when the 7° mark is opposite the indicator on the inspection hole edge. Timing may be set by either mark but it must be remembered that the spark control lever must be fully advanced when contacts separate at the 17° mark and fully retarded when contacts separate at the 7° mark. This will give an identical setting.

Valve Timing:—(Series 115).—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; valve lift, 21/64 inch; spring pressure, 47-53 pounds closed and 96-105 pounds open; tappet clearance, .008 inch (hot). Inlet valves open 25° 50' before top dead center and close 81° 10' after lower dead center. EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; valve lift, 5/16 inch; spring pressure, 47-53 pounds closed and 96-105 pounds open; tappet clearance, .008 inch (hot). Exhaust valves open 101° 50' before lower dead center and close 45° 50' after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

(Series 120-128). INLET VALVES:—Head diameter, 1 7/8 inches; stem diameter, 3/8 inch; valve lift, 21/64 inch; spring pressure, 41-55 pounds closed and 118-134 pounds open; tappet clearance, .008 inch (hot). Inlet valves open 25° 50' before top dead center and close 81° 10' after lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, 3/8 inch; valve lift, 5/16 inch; spring pressure, 41-55 pounds closed and 118-134 pounds open; tappet clearance, .008 inch (hot). Exhaust valves open 101° 50' before lower dead center and close 45° after top dead center.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Model 316. Starter is connected to the engine through a manual pinion shift incorporating a roller clutch and connected to the starting switch. The direction of rotation is counter-clockwise, looking at commutator end. Starter brush tension is 2 1/4-2 1/2 pounds. Starter cranks the engine drawing 175-200 amperes at 5 volts.

BUICK

Amperes	Volts		Amperes	Volts	
18-20	8.5	1450	9-12	7.5	200

Generator motoring draws 5.5-6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts directly across field terminals. Brush spring tension is 22-26 ounces.

Mounting:—Generator is flange mounted at right of engine. To remove generator, disconnect generator lead and ignition leads or remove distributor. Then drain radiator, disconnect pump coupling, remove pump mounting studs and remove water pump. Then remove three flange mounting cap screws and lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the commutator end oiler every two weeks or each 500 miles. The drive end bearing is oiled by splash from the timing gear case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.020 inch, contacts closed.

LIGHTING:—Delco Switch Model 1288 (Series 115) 1289 (Series 120) and 1312 (Series 128). Dimmer Switch Model 1290. Head lamps are 6-8 volt, 21 cp double filament using second 21 cp. filament for dimming. This is controlled by dimmer switch mounted on the steering column. Dash and side lamps are 6-8 volt, 3 cp. S.C. Tail lamp is 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5753. Circuit breaker is mounted on the back of the switch. It cuts in at 25-30 amperes limiting the current to 10-15 amperes.

SERIAL NOS. 3-00001 UP
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXRV-15-2G, 6 volt. Starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded. Battery is mounted on right side of car on right frame member under the dust shield. This battery is not interchangeable with battery used on Series 314 Cadillac because filler plugs are located on opposite side of cap.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts whenever necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 38° (engine) or 20° distributor. Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° (engine) reached at 3000 R.P.M. (engine). Breaker arm spring tension is 16-20 ounces. There are two sets of breaker contacts set at an angle of 135° and operating on a four lobed cam. Contacts open alternately at intervals of 45° corresponding to 90° of crankshaft rotation, which is the correct firing interval for the Cadillac engine. This must be accurately set. (See Timing.)

Mounting:—Ignition coil is mounted on side of distributor mounting. Distributor is mounted at front of engine between the cylinder banks. The ignition system is fitted with an Electrolock switch on the dash which must be removed with the distributor when the distributor is taken off the car. To remove the distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold down screw and lift the distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Breaker contacts must be synchronized to secure proper firing interval before timing is checked. Use Delco-Remy Part No. 822572 for this purpose. Remove taper screw in center of breaker cam. Remove cam and place synchronizing tool on shaft so that fiber bumper of contact arm mounted on stationary plate rests in notch on tool. Then loosen the two screws on the mounting plate and turn the eccentric adjusting screw until the fiber bumper of the second contact arm also rests in the other notch of the tool. Tighten the lock screws and replace the regular firing cam. Breaker contacts begin to separate when the piston entering power stroke reaches a position $\frac{7}{8}$ inch on the flywheel before top dead center with the manual spark advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark lever and continue to crank engine until the mark 'IG/A-1-5' on the flywheel is opposite the indicator on the flywheel case. This mark is $\frac{7}{8}$ inch before top dead center. If the breaker contacts are not separating, loosen the taper screw in the center of the cam and rotate the cam until one set of contacts begin to open. Tighten the screw. The second set of contacts open 45° (distributor rotation) after this point when the flywheel mark 'IG/A-2-6' is opposite the indicator.

Valve Timing:—INLET VALVES:—Head diameter, 1 $\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, 6 $\frac{17}{64}$ inches (over all); valve lift, $\frac{23}{64}$ inch; spring pressure, 133-139 pounds compressed to 2 $\frac{5}{32}$ inches; tappet clearance, .004 inch (cold). Inlet valves open 11° 2' before top dead center and close 58° 38' after lower dead center with cold engine.

EXHAUST VALVES:—Head diameter, 1 $\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, 6 $\frac{1}{4}$ inches (over all); valve lift, $\frac{23}{64}$ inch; spring pressure, 133-139 pounds compressed to 2 $\frac{5}{32}$ inches; tappet clearance, .006 inch (cold). Exhaust valves open 38° 12' before lower dead center and close 7° 38' after top dead center with cold engine. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. The right hand cylinder bank is right viewed from the driver's seat. Number one cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .032 inch.

 SERIAL NOS. 3-00001 UP
 DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
 DELCO-REMY IGNITION

Continued from preceding page.

STARTER:—Model 382. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
4.5 lb. ft.	7000	5	200
19 "	Lock	3	600

Mounting: Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting cap screws. Then pull starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F. inserting a resistance in the field circuit and reducing the output approximately 2.5 amperes. Generator output is adjusted by shifting third brush. Remove commutator cover band and shift third brush mounting plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction washers. The maximum charging rate of 18-20 amperes at 8.6 volts is reached at 1400-1600 R.P.M. or 22-25 M.P.H.

22-25 M.P.H.

Generator Data					
Cold Test 75°F.			Hot Test 175°F.		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.2-8.62	1600	10-12	7.3-7.7	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Generator brush spring tension is 16-20 ounces.

Mounting:—Generator is mounted at right of engine and is driven by silent chain in tandem with the water pump. To remove generator, disconnect wire and remove three mounting nuts. Then pull generator to rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch Model 1313 is mounted at lower end of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Inspection lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail, tonneau, dome, corner and step lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combination vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. It begins to operate at 25-30 amperes limiting the current flow to 10-15 amperes. The lockout circuit breaker protects the horn, stop lamp, inspection lamp, cigar lighter and body lamps. It opens the circuit when the current reaches 25-30 amperes and operate with a discharge current of less than 1 ampere.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

IGNITION:—Coil Model 525-C. Distributor Model 637-V. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Stationary contact is mounted on special crescent shaped arm which moves in same arc as breaker arm allowing contact opening to be set without disturbing parallel surface of contacts. To set contacts, loosen the lock screw on the crescent mounting arm and turn eccentric adjusting screw until proper contact opening is secured. Then tighten the lock screw. Breaker arm spring tension is 15-20 ounces. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 19°. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 24° (engine) at 2400 R.P.M.

Oiling:—Refill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Every month put a small amount of vaseline on the face of the breaker cam.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/32 inches; stem diameter, .309 inch; stem length, 5 1/8 inches; valve lift, 5/16 inch; spring pressure, 60 pounds. Tappet clearance, .007 inch recommended. Inlet valves open 16° before top dead center and close 51° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, .309 inch; stem length, 5 1/8 inches; valve lift, .007 inch recommended; spring pressure, 60 pounds. Exhaust valves open 64° 30' before lower dead center and close 21° after top dead center. Valve stem guides are removable. Oversize valves are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 717-A. Starter is connected to the engine through an inboard Bendix drive Type L-11X-11T. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000.	5	70
11 "	Lock	3.6	450

Mounting:—Starter is flange mounted on forward side of flywheel housing at left of engine. To remove starter, disconnect starter cable and remove flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

GENERATOR:—Model 949-E. The direction of generator rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 21 amperes (cold) reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.6	2000

Motoring freely generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at rear of accessory bracket on right side of engine by special flange mounting using dowel pins to center generator. The pump is driven by an extension of the generator shaft. To remove generator, disconnect pump coupling, drain radiator, remove pump. Then remove four flange mounting bolts and slide generator to the rear. It may then be lifted from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 500 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Clum Switch Types 10562-10486. Head lamps are each 6-8 volt, 21 cp. S.C. Dimming is by resistance on switch. Dash, tail, side and dome lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on switch is 20 amperes.

CHANDLER

SPECIAL SIX MODEL 43 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 611-RHK, 6 volt. Starting capacity is 95 amperes for 20 minutes. Lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded. Battery is mounted under the floor boards of the front compartment on the left frame member.

IGNITION:—Coil Model 525-C. Distributor Model 637-U. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 25° (engine). Automatic advance starts at 400 R.P.M. (engine) and reaches a maximum of 24° (engine) at 2400 R.P.M. Breaker arm spring tension is 15-20 ounces.

Mounting:—Ignition coil is mounted on engine side of dash. Distributor is mounted on cylinder head and is accessible from the right side. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then loosen distributor clamp screw and lift distributor from place.

Oiling:—Refill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Every month put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the breaker arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one-half tooth on the flywheel past top dead center with the spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever and continue to crank engine until the top dead center mark 'D1-C6' is one-half tooth past the notch in the inspection hole on the right side of the flywheel housing. The inspection hole is covered by a plate which must be removed to check timing. The breaker contacts should begin to separate at this point. If they do not, loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. Make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

On cars with magneto ignition breaker contacts should be fully separated on the center of the cam when the piston entering power stroke is on top dead center with the flywheel mark 'D1-C6' directly opposite the indicator notch in the flywheel housing and with the manual spark control lever in the fully retarded position.

Valve Timing:—INLET VALVES:—Head diameter, 1 17/32 inches; stem diameter, .340 inch; stem length, 6 3/8 inches; valve lift, 5/16 inch; spring pressure, 65 pounds; tappet clearance, .006-.008 inch. Inlet valves open 2° before top dead center and close 52° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 17/32 inches; stem diameter, .340 inch; stem length, 6 3/8 inches; valve lift, 5/16 inch; spring pressure, 65 pounds; tappet clearance, .006-.008 inch. Exhaust valves open 53° before lower dead center and close 16° after top dead center. Valve stem guides are not removable. Oversize stem guides are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .027 inch.

STARTER:—Model 713-J. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.6	475

Oiling:—Put 4 or 5 drops of light engine oil in the starter bearing oilers every month or each 1000 miles.

**CHANDLER
SPECIAL SIX MODEL 43 (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION**

Continued from preceding page.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove flange mounting cap screws. Then slide starter forward and lift from place.

GENERATOR:—Model 949-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. Maximum charging rate is 21 amperes (cold) reached at 1450 R.P.M. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21	8.5	1450	9-12	7.6	2000

Running as a motor, generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted by special flange to rear of fan pulley bracket at right of engine. To remove generator, disconnect generator lead and water pump coupling. Then remove flange mounting cap screws and slide generator to the rear. Then tension of the timing chain is adjusted by moving the entire generator and fan pulley bracket mounting away from the engine block around the lower flange mounting cap screw as a pivot. To adjust chain, loosen three flange mounting cap screws on the fan pulley bracket and shift bracket until proper tension is secured. The chain should be loose enough to operate noiselessly. With proper adjustment, movement of pump shaft should be $\frac{1}{8}$ - $\frac{3}{16}$ inch.

Oiling:—Put 4 or 5 drops of light engine oil in the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at approximately 600 R.P.M. when the voltage of the generator reaches 7-7.5 amperes and opens with a discharge current of 0.2-5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Clum Switch Model 10463. Head lamps are 6-8 volt, 21 cp. S.C. Side, dash, tail and dome lamps are each 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C.

FUSES:—Lighting fuse on switch is 20 amperes.

DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 613-RHK, 6 volt. Starting capacity is 115 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the floor boards of the front compartment on the right hand frame member.

IGNITION:—Coil Model 525-C. Distributor Model 637-X. Breaker contacts separate .015-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Stationary contact is mounted on crescent shaped mounting plate which moves in same arc as breaker arm. This allows setting of contacts without disturbing parallel surface of breaker contacts. To adjust contact opening, loosen lock screw on crescent mounting plate just back of stationary contact. Then turn eccentric adjusting screw until correct opening is secured. Tighten the lock screw. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 22°. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance of 22° is reached at 2600 R.P.M. Breaker arm spring tension is 15-20 ounces.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then loosen lockscrew on side of distributor mounting and lift distributor from place.

Oiling:—Refill the grease cup with medium cup grease and turn down two turns every month or each 1000 miles. Every month put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one-half tooth on the flywheel past top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark control lever and continue to crank engine until piston No. 1 reaches top dead center. At this point the dead center mark on the flywheel '1/6' will be directly on top of the flywheel and under the center of the flywheel housing. Then crank engine over one half tooth from this point. The breaker contacts should begin to separate. If they do not, loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. Make certain that the rotor button is under the segment connected to the spark plug in cylinder No. 1.

On cars with magneto ignition, breaker contacts should be fully open when the piston entering power stroke reaches a position two and one half teeth on the flywheel past top dead center with the spark control lever and breaker assembly in the fully retarded position. To set magneto timing, crank engine until piston No. 1 reaches firing position. Then loosen coupling at front of magneto and remove breaker box cover and distributor head. Rotate magneto armature until distributor brush is directly under No. 1 segment. Then turn armature slightly until breaker contacts just begin to separate. Tighten magneto coupling and replace breaker box cover and distributor head.

Valve Timing:—INLET VALVES:—Head diameter, 1 23/32 inches; stem diameter, .372 inch; stem length, 6 9/16 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .007 inch recommended. Inlet valves open 2° before top dead center and close 52° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 23/32 inches; stem diameter, .372 inch; stem length, 6 9/16 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .007 inch recommended. Exhaust valves open 53° before lower dead center and close 16° after top dead center. Valve stem guides are not removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Gaps are .025 inch.

BATTERY:—Prest-O-Lite. Type 615-JFK, 6 volt. Starting capacity is 120 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the floor boards of the front compartment on the right hand frame member.

IGNITION:—Coil Model 525-C. Distributor Model 658-G. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 33° (engine). Automatic advance begins at 400 R.P.M. and reaches a maximum of 35° at 2400 R.P.M. Breaker arm spring tension is 17-21 ounces. Two sets of breaker contacts are used. They operate on a four sided cam and open alternately at intervals of 45° corresponding to 90° of crankshaft rotation. The firing interval must be correctly set for proper ignition.

Mounting:—Ignition coil is mounted in the right frame member channel. Distributor is mounted on the front of the generator at right of engine. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then disconnect manual advance control rod and loosen distributor clamp screw. Then lift distributor from place.

Oiling:—Every two weeks remove the rotor button and put 3 or 4 drops of light engine oil in the wick oiler of the distributor shaft. Every month put a small bit of heavy grease or vaseline on the face of the breaker cam. Refill the grease cup on the side of the distributor shaft with medium heavy cup grease and turn down one turn every month or each 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one tooth on the flywheel past top dead center with the manual spark control lever in the fully advanced position. To set timing, adjust breaker contacts to separate .018 inch. Then crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever and crank engine until piston No. 1 reaches top dead center when the flywheel mark '#1 TDC' will be opposite the indicator in the inspection hole in the flywheel housing at the right of engine. Continue to crank engine over one tooth past the top dead center mark. The breaker contacts on stationary plate should separate at this point. If they do not, loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. To check the second set of contacts, crank the engine over 90° until piston No. 6 reaches firing position. The top dead center mark for piston No. 6 (a short straight line on the face of the flywheel) will be one tooth past the indicator on the flywheel housing. This point is 28 teeth past the firing position of piston No. 1. The breaker contacts should begin to separate at this point. If they do not, loosen the two lock screws on the breaker assembly mounting plate and turn the eccentric adjusting screw until they begin to separate. Tighten the two lock screws.

Valve Timing:—INLET VALVES:—Head diameter, 1 21/32 inches; stem diameter, .372 inch; stem length, 6 13/32 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .007 inch. Inlet valves open 2° before top dead center and close 52° after lower dead center. These figures are correct with a tappet clearance of .007 inch.

EXHAUST VALVES:—Head diameter, 1 17/32 inches; stem diameter, .372 inch; stem length, 6 13/32 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .007 inch. Exhaust valves open 64° 3' before lower dead center and close 21° after top dead center. Valve stem guides are not removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8 inch. Gaps are .027 inch.

STARTER:—Model 727-A. Starter is connected to the engine through a set of reduction gears and an outboard Bendix drive. The direction of rotation is clockwise (armature shaft), looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces.

CHANDLER
ROYAL EIGHT MODEL 37 (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oilers at each end of the starter armature shaft every two weeks or each 500 miles. Every six months or each 5000 miles remove the pipe plug from the gear compartment and repack the reduction gears with medium cup grease.

GENERATOR:—Model 944-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum charging rate of 20 amperes (cold) is reached at 1300 R.P.M.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19	8.5	1300	12	7.65	1500

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 16-18 ounces each.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect generator lead and all ignition wires or remove distributor from mounting. Then remove three flange mounting cap screws and slide generator to the rear. Make certain that timing chain does not slip off generator drive sprocket as this will disturb valve timing of engine. The timing chain is adjusted by loosening the two upper mounting screws of the generator and moving generator and distributor assembly outward. There should be just enough play in the chain to allow it to run silently.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 500 R.P.M. when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-3 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 470-S. Head and stop lamps are each 6-8 volt, 21 cp. S.C. Side lamps on cowl are 6-8 volt, 3 cp. S.C. Instrument panel lamps, corner lamps and tail lamp are each 6-8 volt, 3 cp. S.C. Emergency lamp is 6-8 volt, 21 cp. S.C. This is mounted on a bracket under the dash and is in the cigar lighter socket after the heating element is removed.

Dimmer System:—A foot operated dimmer switch is used in conjunction with the head lamp circuit.

FUSES:—Lighting fuse on switch is 20 amperes.

CHRYSLER MODEL 52 (LATE 1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type WXR-13, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The positive (+) terminal is grounded. Battery is mounted under floor boards of front compartment on left frame member.

IGNITION:—Coil Model 525-C. Distributor Model 638-C. Breaker contacts separate .018-.023 inch. Resurface contacts on a medium hard oilstone or with a fine flat contact file. To adjust contact opening, loosen lock screw located behind stationary contact and turn eccentric adjusting screw on crescent shaped contact mounting arm until desired breaker gap is obtained. Then tighten lock screw to hold adjustment. Distributor is of the semi-automatic type. Manual advance is 22°. Automatic advance begins at 400 R.P.M. Maximum automatic advance is 18° at 1800 R.P.M. Breaker arm spring tension is 15-20 ounces. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Mounting:—Distributor is mounted at front of engine and is accessible from the right side. Drive is by slotted tongue from the forward end of the cam shaft. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then remove two mounting bolts holding distributor bracket and gear case to forward end of engine gear case. Distributor can then be lifted from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Keep the oiler on the distributor gear compartment filled with light engine oil.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches a position .063 inch before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the up stroke with both valves closed). Then continue to crank engine until pistons No. 1 and No. 4 reach a position .063 inch before top dead center. Make certain that the spark control lever is in the fully advanced position. Loosen the clamp screw holding distributor in position on spark control lever and rotate distributor until contacts begin to separate. Tighten the clamp screw and replace the rotor and distributor head. Make certain that the rotor is opposite the segment connected to spark plug in cylinder No. 1. In setting timing, a variation of .011 inch is allowable. Piston limits are .075-.052 inch before top dead center.

'RED HEAD' engines are specially timed. Breaker contacts separate with piston .004 inch before top dead center with spark fully advanced. Allowable variation is .002 inch. Piston limits are .002-.006 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .004 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; intake opens at top dead center and closes at 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .006 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; exhaust opens at 48° before lower dead center and closes 2° past top dead center. Stem guides are removable. No over-size valve stems are made. Valves in 'RED HEAD' engines are of special material.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .030 inch. Special plugs are used in 'Red Head' engines.

STARTER:—Model 712-F. Starter is connected to the engine through an outboard Bendix drive Type R-11-X. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 150 R.P.M. taking 150 amperes at 5 volts. Starter switch is Model 404-V. Starter brush tension is 24-28 ounces.

6.0 "	550	4.4	300
9.4 "	150	4.0	400
11.0 "	Lock	3.7	450

Mounting:—Starter is flange mounted at left of engine on forward side of bell housing. To remove starter, disconnect starter cable and remove two flange mounting screws. Then slide starter from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The bearing on the drive end is oilless.

GENERATOR:—Model 947-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, remove the commutator cover band and loosen the small round headed screw on the commutator end plate of the generator. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum output is 17 amperes (cold) reached at 1800 R.P.M. or 20-22 M.P.H.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

13	7.8	2500	10.6	7.5	2500
11	7.6	3000	9.4	7.4	3000

Shunt field current is 4.5 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is cradle mounted at front end of the engine and is belt driven. The fan is mounted on the forward side of the generator drive belt. To remove generator, disconnect generator lead and loosen the generator cradle stud nut which is the large nut directly under the generator holding the generator cradle bracket in position. Then lower generator and cradle and slip off drive belt. Loosen nut on generator mounting strap and slide generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on each end of the generator every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Briggs and Stratton Switch or Clum Switch Model 10607. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on back of switch is 20 amperes.

Plate 1255A

CHRYSLER

MODEL 62 (LATE 1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type LWR-4, 6 volt. Starting capacity is 107 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.6 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 637-N. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25° (engine). Automatic advance is 18° (engine). Breaker arm spring tension is 15-20 ounces.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .030 inch before top dead center with the spark control lever in the fully advanced position. A variation of .005 inch is permitted with piston limits at .025 and .035 inch before top dead center.

'RED HEAD' engines must be timed differently. Breaker contacts separate with piston .008 inch before top dead center with spark fully advanced. Allowable variation is .002 inch with piston limits at .004 and .008 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .004 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; inlet opens 3° after top dead center and closes 137° after top dead center (or 43° before lower dead center).

EXHAUST VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .006 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; exhaust opens 135° after top dead center (or 45° before lower dead center) and closes 5° after top dead center. Valve stem guides are removable. Oversize valve stems are not made. Valves used on 'RED HEAD' engines are of special material.

Mounting:—Distributor is mounted on top of the cylinder head. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Firing Order:—The firing order is 1-5-3-6-2-4

Spark Plugs:—Spark plugs are 7/8 inch. Gaps are .027-.030 inch. Special plugs are used in 'Red Head' engines.

STARTER:—Model 714-D. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 178 R.P.M., taking 164 amperes at 5.1 volts. Starter brush tension is 26 ounces.

Starter Data			
Torque	R.P.M	Volts	Amperes
0 lb. ft	5000	5.0	65
2 "	1650	5.1	150
6 "	700	4.5	280
12 "	Lock	3.63	475

Switch:—Starting Switch is Model 404-T

Mounting:—Starter is barrel mounted at left of flywheel housing. To remove starter, remove pilot screw on top of housing and slide starter from position.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 if the the car is driven more than 1000 miles in a month.

GENERATOR:—Model 949-L. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output loosen the small round headed screw on the generator end plate and shift the third brush. Shifting the brush in a counter-clockwise direction increases the charging rate, and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 14-16 amperes reached at 1500 R.P.M. or 22 M.P.H.

14	7.9	2000	9.5	7.4	2500
11.5	7.6	2500			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 18-24 ounces each.

Mounting:—Generator is mounted at right of engine by a No. 3 S.A.E. flange mounting to the timing gear chain case. To remove generator remove cover plate on front of case and remove three nuts holding generator in place. Then slide generator to rear, removing chain, but being careful that chain does not slip over cam shaft sprocket, or engine camshaft timing will be disturbed.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is oiled by splash from the gear case.

RELAY:—**Model 265-B.** Relay is mounted on top of the generator. Relay closes when the generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—**Clum Switch Model 10629.** Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop and dome lamps are each 6-8 volt, 15 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Auxiliary head lamps are 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on back of switch is 20 amperes.

MODEL 72 (LATE 1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—Willard, Type CWR-15, 6 volt, 100 ampere hour. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 659-A or 659-B. Breaker contacts separate .022 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Distributor is semi-automatic. Manual advance is 25° (engine). Maximum automatic advance is 22° (engine). Breaker arm spring tension is 17.5-20.5 ounces. Distributor uses two sets of contacts operating on a three sided cam and opening alternately at intervals of 60° corresponding to 120° of crankshaft rotation. This firing interval must be correctly set (see Timing). Because of the Electrolock used with this distributor, the distributor and Electrolock should be removed from the car and replaced whenever service is necessary.

Mounting:—Distributor is mounted on top of cylinder block. To remove distributor, disconnect coil lead and high tension cables or remove distributor head. Then disconnect manual advance rod and remove manual advance stop screws. Lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .067 inch before top dead center with the spark advance lever in the fully advanced position. A variation of .007 inch is allowable in piston position. The piston limits are .075 and .060 inch before top dead center. In checking timing, first set distributor with correct firing interval between opening of two sets of contacts. Check contact opening of stationary set of contacts. Then place Delco-Remy No. 820751 synchronizing tool on shaft with left hand side of spring in slot in shaft. Then turn shaft until left hand graduations are near slot in rim of distributor cup. Continue to turn shaft and note reading when stationary contacts separate. For an accurate check, connect a six volt lamp in primary circuit. The lamp will go out at the instant the contacts separate. Continue to turn shaft until the same reading on the other scale is opposite the slot. If second set of contacts are not separating, loosen two lock screws on mounting plate and turn eccentric adjusting screw until contacts begin to separate. Tighten the lock screws and check the contact opening. If contact opening has shifted outside of limits .018-.024 inch, repeat the operation.

'RED HEAD' engines are specially timed. Breaker contacts separate with piston .004 inch before top dead center with spark fully advanced. Allowable variation in piston position is .005-.002 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 19/32 inches; stem diameter, 11/32 inch; stem length, 7 1/8 inches; valve lift, 5/16 inch; spring pressure, 52-82 pounds; tappet clearance, .005 inch. Inlet valves open 6° after top dead center and close 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 23/32 inches; stem diameter, 11/32 inch; stem length, 7 1/8 inches; valve lift, 5/16 inch; spring pressure, 52-82 pounds; tappet clearance, .007 inch. Exhaust valves open 42° before lower dead center and close 8° after top dead center. Valve stem guides are removable. Oversize valve stems are not made. Valves in 'RED HEAD' engines are of special material.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. Gaps are .027-.030 inch. Special plugs are used in 'RED HEAD' engines.

STARTER:—Model 724-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 144 R.P.M. taking 157 amperes at 5.27 volts. Starter Switch is Model 404-T.

14	7.9	2000	9.5	7.4	2500
11.5	7.6	2500			

Shunt field current is 5 amperes at 6 volts. Generator brush tension should be 18-24 ounces each.

Mounting:—Generator is mounted at right of engine by a No. 3 S.A.E. flange mounting to the timing gear chain case. To remove generator remove cover plate on front of case and remove three nuts holding generator in place. Then slide generator to rear, removing chain, but being careful that chain does not slip over cam-shaft sprocket, or engine camshaft timing will be disturbed.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is oiled by splash from the gear case.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Clum Switch Model 10636. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Auxiliary head lamps are 6-8 volt, 3 cp. S.C. Dome, stop and backing lamps are each 6-8 volt, 15 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 410-B. Lighting circuits are protected by two vibrating circuit breakers mounted in a single unit on the dash. Circuit breaker begins to operate with a current of 25-30 amperes limiting the current to 12-15 amperes.

Delco-Remy System

Plate 1257A

DODGE

NEW FOUR. SERIES 128 (1927)

NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM

BATTERY:—Willard, Type WR-13, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Type 19232. Distributor Type 10826. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 20°. Automatic advance begins at 400 R.P.M. (flywheel). Maximum automatic advance is 26° (flywheel) reached at 2200 R.P.M.

Mounting:—Ignition coil is mounted on the back of the dash. Distributor is mounted on the top of the cylinder block between cylinders 2 and 3. To remove distributor, disconnect primary lead and manual advance rod and remove head with high tension cables attached. Then remove set screw in side of distributor shaft housing and lift distributor from place.

Oiling:—Put a few drops of medium machine oil in the oiler on the side of the distributor housing every 2000 miles. At the same time remove the rotor button and put two or three drops of oil on the felt wick in the oiler in the center of the shaft. Once each season put a small bit of cup grease on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when piston No. 1 reaches a position before top dead center when the ignition mark 'I' on the flywheel is opposite the notch in the flywheel housing peephole on the left side of the flywheel housing. This mark is 12° before the top dead center mark. The manual advance lever must be in the fully advanced position. To check timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark control lever and continue to crank engine until the flywheel mark 'I' is opposite the notch in the peephole. If the breaker contacts do not separate at this point, loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. With proper setting the backlash of the gears should be sufficient to open and close contacts. This can be checked by watching the dash ammeter while rocking the distributor shaft backward and forward. The ammeter should fluctuate between '0' and discharge.

Valve Timing:—INLET VALVES:—Tappet clearance should be .004-.006 inch. Inlet valves open 3° after top dead center and close 46° after lower dead center. EXHAUST VALVES:—Tappet clearance should be .004-.006 inch. Exhaust valves open 42° before lower dead center and close 1° after top dead center. Valve stem guides are removable. Oversize valve stems are made. The top dead center position on the flywheel is marked by 'DC/1+4'.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

STARTER:—Model SB Type 6404. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 3 pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
4 lb. ft	1200	5.2	190
5.5 "	900	4.8	250
7.6 "	600	4.5	320
10.3 "	300	4.0	420
13.6 "	Lock	3.3	532

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing by standard S.A.E. No. 1 flange mounting. To remove starter, disconnect starter cable and remove three flange mounting bolts. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side.

DODGE

NEW FOUR. SERIES 128 (1927)
NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM
NORTH EAST IGNITION

Continued from preceding page.

GENERATOR:—Model LB Type 6384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator charging rate, loosen the lock screw on the commutator endplate and turn the adjusting screw to shift the third brush. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the lock screw after making the adjustment. The maximum charging rate of 15 amperes (hot) is reached at 1400 R.P.M.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
8.25.....	800	6.....	800
15.25.....	1000	11.....	1000
17.5.....	1200-1400	13.25.....	1200
16.75.....	1600	14.....	1400
15.5.....	1800	13.5.....	1600
14.5.....	2000	12.....	2000

Generator brush spring tension is 12-16 ounces.

Mounting:—Generator is flange mounted on right of engine at rear of timing chain case. The tension of the timing chain is adjusted by loosening the flange mounting cap screws and moving the generator around the lower cap screw as a pivot. Do not set timing chain too tight. There should be sufficient looseness for the chain to run quietly. To remove generator, disconnect the generator wire and remove three flange mounting cap screws. Then pull generator to the rear and lift from place. With the generator out do not crank engine or disturb position of generator drive sprocket as this will affect valve timing.

Oiling:—Put a few drops of medium machine oil in each of the generator bearing oilers every 2000 miles.

RELAY:—Type 15850. Relay is mounted on the generator. Relay closes at 750 R.P.M. when the generator voltage reaches 6.75 volts and opens when the voltage drops to 5.75-6.0 volts with a discharge current of 1-2 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .020-.025 inch. Air gap between relay armature and coil core stop pin is .015 inch with contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 6 cp. S.C. Side, dash and tail lamps are each 6-8 volt, 3 cp. S.C.

Switches:—Lighting switch is mounted on the side of the steering column. The ignition switch is incorporated in the ignition coil.

FUSES:—Generator field fuse is 6 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

DODGE SENIOR LINE—SIX CYLINDER MODEL (1927) NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH EAST IGNITION

BATTERY:—Willard, Type FJRR-5, 6 volt. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Type 19232. Distributor Type 10836. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 20°. Automatic advance begins at 400 R.P.M. Maximum automatic advance is 20° at 2200 R.P.M.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on the cylinder head between cylinders 3 and 4. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with high tension cables intact. Then remove set screw on side of distributor mounting and lift distributor from place.

Oiling:—Put a few drops of medium machine oil in the oiler on the side of the breaker housing every 2000 miles. At the same time remove the rotor button and put 2 or 3 drops of oil on the felt wick in the center of the shaft. Once each season put a small amount of heavy grease on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position before top dead center when the flywheel mark 'IGN' is opposite the notch in the flywheel housing peephole. This is 10° before top dead center. The manual advance lever must be in the fully advanced position. To check timing, crank engine until piston No. 1 enters compression stroke (the up-stroke with both valves closed). Fully advance manual spark control lever and continue to crank engine until the flywheel mark 'IGN' is opposite the notch in the peephole on the left side of the engine. The breaker contacts should just separate. If they do not, loosen clamp screw in manual advance arm and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. If setting is correctly made the back lash of the gears will be sufficient to open and close contacts. This can be checked by watching dash ammeter while rocking distributor.

Valve Timing:—INLET VALVES open at top dead center and close 48° after lower dead center.

EXHAUST VALVES open at 50° before lower dead center and close 6° after top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

STARTER:—Model SB Type 6400. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 3 pounds. Starter switch is Model 15380.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1700	5.6	120

ELCAR MODEL 4-55 (1926-27) REMY GENERATING, STARTING AND LIGHTING SYSTEM REMY IGNITION

BATTERY:—U.S.L. Type XY-13-X, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17.4 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 284-L. Distributor Model 366-U. Breaker contacts separate .025 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Distributor is of manual type. Manual advance is 40°. Breaker arm spring tension is 13-16 ounces.

Mounting:—Distributor is mounted at right of engine. To remove distributor, disconnect manual advance rod and breaker lead. Remove distributor head with high tension cables intact. Then remove locknut and set screw in side of distributor mounting and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every two weeks or each 500 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Then fully retard spark control lever and continue to crank engine until piston reaches top dead center. The breaker contacts should begin to separate at this point. If they do not, loosen lock nut on top of cam and pry cam upward. Rotate cam until contacts begin to separate. Tighten the lock nut making certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

STARTER:—Model 714-A. Starter is connected to the engine through an outboard Bendix drive Type R-11-X. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces. Starter cranks the engine drawing 175 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is mounted by S.A.E. No. 1 flange mounting at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter bearing oilers every month or each 1000 miles.

GENERATOR:—Model 941-Q. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum charging rate of 17 amperes (cold) is reached at 1400 R.P.M.

Generator Data

Cold Test		R.P.M.	Hot Test		R.P.M.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED 1927

BATTERY:—U.S.L. Type XY-13-X. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 174 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 284-P. Distributor Model 636-H. Breaker contacts separate .024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of the semi-automatic type. Manual advance is 25°. Automatic advance is 30°. Breaker arm spring tension is 15-20 ounces. Ignition switch is Remy Model 440-A.

Mounting:—Distributor is mounted on top of the cylinder head. To remove distributor, disconnect primary lead and manual advance rod. Then remove distributor head with high tension cables intact. Remove the set screw in side of mounting and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every month.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To check timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully retard spark control lever and continue to crank engine until piston No. 1 reaches top dead center. At this point the flywheel mark 'UDC-1 6' will be opposite the indicator on the flywheel housing. If breaker contacts are not beginning to separate, loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—**INLET VALVES**—Head diameter, 1 5/8 inches, stem diameter, 3/425-3/41 inch, stem length, 5 19/32 inches (over head), spring pressure, 34-38 pounds (valve closed), valve lift, 5/16 inch, tappet clearance, .006 inch (hot). Inlet valves open on top dead center and close 35° after lower dead center.

EXHAUST VALVES—Head diameter, 1 15/32 inches, stem diameter, 3/425-3/41 inch, stem length, 5 9/16 inches (over head), valve lift, 5/16 inch, spring pressure, 34-38 pounds (valve closed), tappet clearance, .008 inch (hot). Exhaust valves open 42° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Oversize valve stems are made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 SAE Standard 'Short'. Gaps are .027 inch.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces.

Starter Data			
Torque	RPM	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR:—Model 941-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the commutator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 21 amperes (cold) reached at 1450 RPM.

MODEL 8-81 AND MODEL 8-81 TAXICAB (1926-1927)
REMY GENERATING, STARTING AND LIGHTING SYSTEM
REMY IGNITION

BATTERY:—U.S.L. Type XY-15-X, 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 284-L. Distributor Model 648-A. Breaker contacts separate .020-.028 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20° (engine). Automatic advance begins at 400 R.P.M. (engine) and reaches a maximum of 17° at 1800 R.P.M. Breaker arm spring tension is 17-21 ounces. Breaker uses two sets of contacts opening together. For correct ignition the contact must be synchronized. See Timing. Ignition switch is Remy Model 440-A.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor disconnect primary lead and remove distributor head with high tension cables intact. Then remove set screw on side of distributor mounting and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small bit of vaseline on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To check timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Make certain that spark control lever is fully retarded and continue to crank engine until piston No. 1 reaches top dead center. Both sets of contacts should begin to separate at this point. Set contacts on stationary plate by loosening locknut on top of breaker cam and rotating cam until contacts begin to separate. Then reset the cam and tighten locknut. Set the other set of contacts on movable plate by loosening three lock screws and shifting breaker assembly until contacts begin to separate. Tighten the lock screws. A very accurate check of the contacts can be made by connecting a test lamp across each set of contacts. When the contacts separate the lamps will light. They should both light at the same instant.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, .3425-.341 inch; stem length, 5 19/32 inches (over head); valve lift, 5/16 inch; spring pressure, 34-38 pounds (valve closed); tappet clearance, .006 inch (hot). Inlet valves open on top dead center and close 35° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/32 inches; stem diameter, .3425-.341 inch; stem length, 5 9/16 inches (over head); valve lift, 5/16 inch; spring pressure, 34-38 pounds (valve closed); tappet clearance, .008 inch (hot). Exhaust valves open 42° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Oversize valve stems are made.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces.

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR:—Model 941-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165° cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 21 amperes (cold) reached at 1450 R.P.M.

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 22-28 ounces.

Mounting:—Generator is flange mounted at right of engine at rear of timing gear case. To remove generator, disconnect generator lead and remove three flange mounting cap screws. Then slide generator to the rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 675 R.P.M. when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-3 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Remy Switch Model 420-F. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side lamps (or cowl lamps) are 6-8 volt, 4 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp and corner lamps are each 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuses mounted under switch cover are 10 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

ELCAR

MODEL 6-70 (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—U. S. L. Type XY-13X, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. Battery is mounted under the right front seat.

IGNITION:—Coil Model 525-C. Distributor Model 636-S. Breaker contacts separate .020-.028 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25°. Maximum automatic advance is 30°. Breaker arm spring tension should be 17.5-20.5 ounces.

Mounting:—Distributor is mounted on top of engine block. To remove distributor, disconnect manual advance rod and coil lead and remove high tension cables or remove distributor head. Then loosen distributor clamp screw at base of distributor cup and lift from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the up stroke with both valves closed). At this point the flywheel mark '1' and '6' will be opposite the indicator on the flywheel case. Make certain that the spark control lever is fully retarded. Loosen clamp screw under distributor cup and rotate distributor until contacts begin to separate. Tighten the clamp screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 17/32 inches; stem diameter, .3425-.341 inch; stem length, 5 5/16 inches over head; tappet clearance, .006-.008 inch (hot); spring pressure, 36 pounds; valve lift, 11/32 inch. Inlet opens at top dead center and closes 45° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, .3425-.341 inch; stem length, 5 5/16 inches over head; tappet clearance, .008 inch (hot); spring pressure, 36 pounds; valve lift, 11/32 inch. Exhaust opens 50° before lower dead center and closes 10° after top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. Standard 'Short.' Gaps are .027 inch.

STARTER:—Model 716-A. Starter is connected to engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter brush tension is 24-28 ounces. Starting switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is mounted at front of flywheel housing on right of engine. To remove starter, disconnect starter cable and remove three flange mounting screws. Then slide starter forward from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 949-C. The direction of rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system combined with a thermostat. Thermostat contacts open at 150°F cutting a resistance into the shunt field circuit and reducing output approximately 40%. Thermostat does not require adjustment or attention. To adjust generator output, remove commutator cover band and loosen small round headed screw on generator end plate. Then shift third brush in a counter-clockwise direction to increase charging rate and in a clockwise direction to decrease charging rate. Tighten the screw after making the adjustment.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Shunt field current is 4 amperes at 6 volts. Generator brush spring tension is 24-28 ounces each. Generator motoring draws 5 amperes at 6 volts.

Mounting:—Generator is mounted at forward end of engine on right side by special swing mounting and is belt driven. Care must be taken not to get the belt too tight or excessive wear of the generator bearings will result. To remove generator, remove two screws on swinging base bracket. Slip driving belt from pulley and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 675 R.P.M. of the generator when the voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed. Set contact opening by bending brass stop over relay armature. Set air gap by loosening two screws at base of relay armature and inserting feeler gauge between armature and coil core. Then close relay contacts by hand and tighten the two base screws.

LIGHTING:—Delco-Remy Switch Model 1303. Head lamps are 6-8 volt, 21 cp. double filament using Tilt-ray principle for dimming. Auxiliary head lamps are 6-8 volt, 3 cp. S.C. Side lamps are 6-8 volt, 4 cp. S.C. Stop lamp is 6-8 volt, 12 cp. S.C. Dome lamp is 6-8 volt, 6 cp. D.C. Dash lamps are 6-8 volt, 3 cp. D.C. Tail lamp is 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuses are 10 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

ELCAR MODEL 8-82 (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-15X, 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The negative (—) terminal is grounded. Battery is mounted under the right front seat.

IGNITION:—Coil Model 525-C. Distributor Model 658-B. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 15°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 17.5° at 2000 R.P.M. Breaker arm spring tension should be 17-21 ounces. Double breaker contacts are used. They operate on a four sided cam and open at intervals of 45° corresponding to 90° of crankshaft rotation. It is very important that the firing interval be correctly set. To check position of second set of breaker contacts (see Timing).

Mounting:—Distributor is mounted on the top of the engine block on the left side. To remove distributor, disconnect breaker leads and remove high tension cables or remove distributor head. Then loosen distributor clamp screw under distributor cup and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove rotor button and saturate wick oiler with light engine oil. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Make certain that the spark control lever is fully retarded. Loosen distributor clamp screw and rotate distributor until stationary contacts begin to separate. Tighten the clamp screw. To check second set of contact on movable plate, use special tool issued by Delco-Remy Corporation. Contacts can be checked without tool by cranking engine over 90° after setting timing in cylinder No. 1. Piston No. 6 will then be on top dead center entering power stroke. The contacts on movable plate should open at this point.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/32 inches; stem diameter, .3425-.341 inch; stem length, 5 5/16 inches over head; tappet clearance, .006-.008 inch (hot); spring pressure, 36 pounds; valve lift, 11/32 inch. Inlet opens at top dead center and closes 45° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, .3425-.341 inch; stem length, 5 5/16 inches over head; tappet clearance, .008 inch (hot); spring pressure, 36 pounds; valve lift, 11/32 inch. Exhaust opens 50° before lower dead center and closes 10° after top dead center. No valve stem guides are used. Oversize valves are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. 'Short.' Gaps are .027 inch.

STARTER:—Model 716-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter brush tension is 24-28 ounces. Starting switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5.0	70
15 "	Lock	3.7	450

Mounting:—Starter is flange mounted on forward side of flywheel housing at right of engine. To remove starter, disconnect starter cable, remove three flange mounting cap screws and slide starter forward from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

ELCAR MODEL 8-90 (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L. Type XY-17X, 6 volt. Starting capacity is 136 amperes for 20 minutes. Lighting capacity is 5 amperes for 24 hours. The negative (—) terminal is grounded. Battery is mounted under the right front seat.

IGNITION:—Coil Model 525-C. Distributor Model 658-A. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Double breaker contacts are used. They operate on a four sided cam and open alternately at intervals of 45° corresponding to 90° of crankshaft rotation. It is very important that the firing interval be correctly set. To set position of second set of breaker contacts see (Timing). Distributor is semi-automatic. Manual advance is 15°. Automatic advance begins at 300 R.P.M. Maximum automatic advance is 17° reached at 1800 R.P.M. (engine). Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on top of engine block at center. To remove distributor, disconnect breaker leads and remove high tension cables or remove distributor head. Then loosen distributor clamp screw under distributor cup and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor button and saturate the wick oiler with light engine oil. Put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Make certain that the spark control lever is in the fully retarded position. Loosen distributor clamp screw and rotate distributor cup until stationary contacts begin to separate. Tighten the clamp screw. To check second set of contacts (on movable plate), use special adjustment cam issued by Delco-Remy Corporation. Remove cam and place special adjustment cam on shaft. Loosen screws holding second set of contacts on breaker plate and shift until fiber bumper of contact arm rests in notch on cam. Tighten the screws. Setting of contacts can be checked without adjusting tool by cranking engine over 90° after setting timing in cylinder No. 1. Piston No. 6 will then be on top dead center entering power stroke. The breaker contacts should separate at this point.

Valve Timing:—INLET VALVES—Head diameter, 1 5/8 inches, stem diameter, .3425-.341 inch, stem length, 5 19/32 inches over head; tappet clearance, .066 inch (hot); spring pressure, 34-38 pounds (valve closed); valve lift, 5/16 inch; inlet opens on upper dead center and closes 35° after lower dead center.

EXHAUST VALVES—Head diameter, 1 15/32 inches; stem diameter, .3425-.341 inch; stem length, 5 9/16 inches (over head); tappet clearance, .008 inch (hot); spring pressure, 34-38 pounds (valve closed); valve lift, 5/16 inch; exhaust opens 42° before lower dead center and closes 5° after top dead center. Valve stem guides are removable. Oversize valve stems are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. Standard 'Short'. Gaps are .027 inch.

STARTER:—Model 720-O. Starter is connected to engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at commutator end. Starter brush tension is 24-28 ounces. Starter switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted on forward side of flywheel housing on right side of engine. To remove starter, disconnect starter cable, remove three flange mounting cap screws and slide starter forward from place.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type CRR-13, 6 volt, 90 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The positive (+) terminal is grounded. Battery is mounted in special battery box on right hand running board.

IGNITION:—Coil Model 525-A. Distributor Model 637-Y. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Stationary contact is mounted on special crescent shaped arm which moves in same arc as movable contact. To set contact opening loosen screw on contact arm and turn eccentric adjusting screw until proper gap is secured. Then tighten lock screw. The parallel surface of the contacts will not be disturbed. Distributor is semi-automatic. Manual advance is 15°. Maximum automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 23° (engine) at 2800 R.P.M. Breaker arm spring tension should be 15-20 ounces.

Mounting:—Distributing is mounted on rear of generator at right of engine by S.A.E. standard 'A' mounting. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then disconnect manual advance rod and remove lock screw in side of distributor shaft housing. Then lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever one-half advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the up-stroke with both valves closed). Place spark control lever midway between the fully retarded and fully advanced positions. Continue to crank engine until piston No. 1 reaches top dead center. If breaker contacts do not separate at this point, loosen distributor clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

Valve Timing:—INLET VALVES:—Head diameter, 1 3/8 inches; stem diameter, 5/16 inch; tappet clearance, .006 inch (hot). Inlet opens at top dead center and closes 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 5/16 inch; tappet clearance, .006 inch (hot). Exhaust opens at 40° before lower dead center and closes 7° after top dead center. Valve stem guides are removable. Over-size valve stems are not made.

STARTER:—Model 712-G. Starter is connected to the engine through a Bendix out-board drive Type R-11-X. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine taking 175 amperes at 4.5 volts. Starter brush tension is 28-31 ounces. Starting switch is Model 405-C.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	70
11 "	Lock	3.6	450

Mounting:—Starter is mounted on right of engine by modified flange mounting. To remove starter, disconnect starter cable. Then remove three flange mounting screws and slide starter forward from place.

Oiling:—Put 8 or 10 drops of light engine oil in the commutator end bearing of the starter every month or each 1000 miles. The drive end bearing is oilless and requires no attention.

Continued on reverse side.

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 942-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and loosen small round headed screw on generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 16 amperes (cold) at 8.5 volts reached at 1600 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
16	8.5	1600	11-13	7.5	1850

Generator brush tension is 16-18 ounces each. Running as a motor, generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts.

Mounting:—Generator is mounted at right of engine by special flange mounting. To remove generator, remove distributor or disconnect all distributor lines. Then loosen chain adjustment set screw and remove two flange mounting screws. Slide generator to rear, being careful not to let timing chain slip off drive sprocket, as this will disturb valve timing.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 6.75-7.5 volts with a maximum charging current of 3 amperes and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed. Set contact opening by bending brass stop over relay armature. To set air gap, loosen two screws at base of relay armature and insert feeler gauge between core and armature to secure proper gap. Then close contacts by hand and tighten the two screws.

LIGHTING:—Briggs & Stratton Lighting Switch. Head lamps are 6-8 volt, 21 cp. double filament using Tilt-ray system for dimming. Side lamps are 6-8 volt, 3 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on switch is 20 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

ESSEX SUPER SIX (LATE 1927) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Prest-O-Lite, Type 6-13-JFK, 6 volt. Starting capacity is 102 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model CE-4001. Distributor Model IBA-4001. Breaker contacts separate .018-.022 inch. They are made of tungsten. Resurface contacts with a fine flat jeweler's file or on a medium hard oilstone. Distributor is of the full automatic type. No manual advance is provided. Automatic advance begins at 400 R.P.M. (engine). Advance at 2800 R.P.M. (engine) is 10° (engine) increasing to 12° at 4000 R.P.M. Breaker arm spring tension is 24 ounces.

Oiling:—Put 6 or 8 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Put one drop of light engine oil on the breaker arm pivot pin every week or each 250 miles and place a small bit of vaseline on the face of the breaker cam under the fiber bumper every 5000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center. To set timing, crank engine until piston No. 1 reaches this position. The D.C. mark on the flywheel will be opposite the lower edge of the motor support.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Metric Standard. Gaps are .025 inch.

STARTER:—Model MZ-4005. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2½-3 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	
1.5 "	1800	5.2	150
2.5 "	1325	5.0	200
5.0 "	740	4.5	300
7.6 "	220	4.0	400
12.2 "	Lock	4.0	550

Mounting:—Starter is mounted by special flange at left of engine on forward side of flywheel case. To remove starter, disconnect starter cable, horn wire and wire to junction block. Then remove three flange mounting screws and pull starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAA-4005. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust the charging rate, remove the commutator cover band and shift the third brush by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting bracket is held in any position by friction between the mounting lug and the endplate. The maximum charging rate is 12 amperes (cold) at 8 volts which is reached at 1450 R.P.M.

Generator Data

Cold Test (68°F.)			Hot Test (203°F.)		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	675	2	7.0	680
6	7.3	815	6	7.4	880

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

Continued from preceding page.

Mounting:—Generator is cradle mounted at right of engine. To remove generator, disconnect generator wire and loosen mounting strap. Then disconnect flexible coupling and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model CB-4015. Relay is mounted on a special bracket riveted to the generator endplate. Relay closes at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch Model 10643. Auto-Lite No. XA-319. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side, dash and tail lamps are each 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C.

FUSES:—Lighting fuse on switch is 20 amperes. Two spare fuses are provided. Generator field fuse mounted on frame is 5 amperes.

Super Six (Late 1927)

Auto-Lite System

Plate 1267A

FALCON KNIGHT

MODEL 10 (1927) SERIAL NUMBERS 1000 UP AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-7X, 6 volt. Starting capacity is 148.5 amperes for 20 minutes. Lighting capacity is 5 amperes for 28.4 hours. The negative (—) terminal is grounded. Battery is mounted under the front floor board on the left side.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4107-B, superseded by IGA-4021. Breaker contacts separate .020-.024 inch. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Manual advance is 20° (engine). Automatic advance begins at 800 R.P.M. (engine). Maximum advance is 20° (engine) reached at 2400 R.P.M. Ignition current is 1-3 amperes with engine running and 4-5 amperes with engine stopped.

Mounting:—Coil is mounted on the right side of the engine block at rear of distributor. Coil is grounded through case and all paint and grease must be kept from inside the strap mounting. Distributor is mounted on right side of engine block at forward end of engine. To remove distributor, disconnect manual advance rod and all distributor wires or remove distributor head. Then remove two mounting cap screws and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing with pure vaseline and turn down one turn each week or every 250 miles. Every 5000 miles remove the rotor button and saturate the wick oiler with light engine oil. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .023 inch before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke. This may be determined by removing all spark plugs except No. 1 and cranking engine until compression is felt. Continue to crank engine until piston is .023 inch before top dead center. This may be checked by removing clutch inspection plate. The flywheel mark 'IGN' should be opposite the pointer on the flywheel case. This mark is 8° or 51/64 inch before top dead center. To set timing, loosen distributor clamp screw under distributor cup and rotate distributor cup until the contacts begin to separate. Tighten the clamp screw.

Valve Timing:—The Falcon Knight engine is of the sleeve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold opposite No. 6 cylinder and scrape carbon from edges of sleeve ports so that the closing of ports can be checked. Then remove clutch inspection plate and crank engine until mark 'EC' on the flywheel is opposite the pointer on the flywheel case. Place electric lamp over spark plug port in cylinder No. 6 and rotate eccentric shaft in a clockwise direction until the upper edge of the port in the outside sleeve passes the lower edge of the port in the cylinder block on the downward stroke. At this point the ray of light from the lamp will be cut off. Then assemble chain on crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in chain and change mesh of sprocket in chain until the five cap screws can be inserted without changing the positions of the eccentric shaft or crankshaft. Then tighten the five cap screws thus mounting the eccentric shaft sprocket on the eccentric shaft. To set tension of timing chain, turn idler eccentric bushing spring until all slackness is removed from chain. Then give spring one complete turn and insert end in slot of idler stud.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model ML-4106, superseded by Model MAB-4002. Starter is connected to the engine through a Bendix outboard drive. The direction of rotation is clockwise on Model ML-4106, looking at the commutator end. On Model MAB-4002 the direction of rotation of armature shaft is counter-clockwise. Starter cranks the engine at 140 R.P.M. drawing 180 amperes at 5.2 volts. Starter switch is Model SW-4001. Starter brush tension 2-3 pounds each on Model ML-4106 and 1 3/4-2 1/4 pounds each on Model MAB-4002.

13.....	7.8.....	1950			

Motoring freely at 355-390 R.P.M. generator draws 4.7-5.2 amperes at 6 volts. Shunt field current is 6.1-6.8 amperes at 6 volts. Tested separately each coil draws 24.4-27.2 amperes at 6 volts. Generator brush tension should be 1.0-1.5 pounds.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model CB-4014. Relay is mounted on the generator. Relay contacts close at 545-625 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current must not exceed 5 amperes at closing of contacts. Contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch Model 10643. Auto-Lite No. XA-319. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. instead of dimming. Stop lamp is 6-8 volt, 21 cp. S.C. Side, dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 7.5 amperes. Lighting fuse on switch is 20 amperes.

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—Willard, Type CRR-15, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the front seat.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4117-A. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30° (crankshaft). Automatic advance begins at 1500 R.P.M. and reaches a maximum of 19-21° at 3600 R.P.M. Breaker arm spring tension is 18-20 ounces.

Mounting:—Ignition coil is mounted on the engine side of the dash. Distributor is mounted on the left side of the engine. To remove distributor, disconnect primary lead and manual advance control rod. Then remove distributor head with high tension cables intact and remove set screw on side of distributor mounting. Then lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles. Put a small amount of vaseline on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever one half advanced. To check timing, crank engine until piston No. 1 begins compression stroke (the upstroke with both valves closed). Then advance spark control lever one half placing it midway between the fully advanced and fully retarded positions. Continue to crank engine until piston No. 1 reaches top dead center when the dead center mark for cylinders 1 and 6 will be opposite the indicator on the flywheel case. If breaker contacts do not separate at this point, loosen distributor clamp screw and rotate distributor housing until breaker contacts begin to separate. Tighten the clamp and make certain that the rotor is under the segment connected to spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Model MN-4109. Starter is connected to the engine through a Bendix inboard drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model SW-4002. Brush spring tension is 1 1/4-1 1/2 pounds. Starter cranks the engine at 160 R.P.M. drawing 130 amperes at 4.8 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.0	45 (Without Bendix)
0 "	Free	5.0	50 (With Bendix)
.5 "	2800	5.5	100
2.4 "	1450	5.0	200
4.8 "	950	4.5	300
7.2 "	650	4.0	400
13.6 "	Lock	3.0	620

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 5 to 10 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles.

GENERATOR:—Model GJ-4201. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by tapping on third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction between the third brush mounting stud and the generator endplate. The maximum charging rate is 16 amperes reached at 1600 R.P.M.

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

Generator Data

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
0	6.5	600	0	6.5	600
2	6.6	675	2	7.2	750
5	7.0	780	5	7.4	900
10	7.3	940	10	7.7	1200
14	7.7	1300	12.5	8.0	1600
16	8.0	1600	11.5		2400
15		2400			

Generator motoring draws 5 amperes at 6 volts. Shunt field test current is 2 amperes at 6 volts directly across field terminals. Each coil tested separately draws 8.8 amperes at 6 volts. Brush spring tension is 1¼-1½ pounds each.

Mounting:—Generator is flange mounted at right of engine on rear side of timing chain case. To remove generator, disconnect generator lead and loosen timing chain adjustment set screw. Then remove three flange mounting cap screws and slide generator to the rear, being careful not to disturb timing chain adjustment. Generator is driven by timing chain. The chain may be adjusted by loosening three flange cap screws on generator and shifting generator around lower mounting screw as a pivot. A set screw is provided in the upper mounting slot to secure adjustment. Tighten the mounting cap screws after making the adjustment. Be careful not to get the chain too tight. A chain that operates noiselessly has the proper tension.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model CB-4009. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. of the generator when the voltage reaches 6.5-7 volts and open with a discharge current of 5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Clum Switch Model 10626. Lighting switch is mounted on base of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Dash, tail and dome lamps are each 6-8 volt, 3 cp. S.C. Parking lamps in head lamps are 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuses in junction block are 15 amperes.

Plate 1274

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHT 1927

BATTERY:—Willard, Type SJRR-6, 6 volt. Starting capacity is 160 amperes for 20 minutes. Lighting capacity is 5 amperes for 30 hours. The positive (+) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model 2195. Distributor Model 4027. Breaker contacts separate 0.225-0.275 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (crankshaft). Automatic advance begins at 1000 RPM and reaches a maximum of 21-25° at 3600 RPM. Breaker arm spring tension is 16-20 ounces. Distributor uses two sets of breaker contacts operating on a four sided cam and opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This firing interval must be accurately set for correct ignition (see Timing).

Mounting:—Ignition coil is mounted on the engine side of the dash. The distributor is mounted at the right of the engine. To remove distributor, disconnect primary lead at ignition switch and remove manual advance control rod and stop screw. Then lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Put a small bit of vaseline on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches position 15° before top dead center with spark lever fully advanced. To check timing, crank engine until piston No 1 enters compression stroke (the up stroke with both valves closed). Then advance manual spark control lever and continue to crank engine until piston No 1 reaches firing position when the mark on the flywheel will be opposite the indicator on the flywheel case. The set of breaker contacts mounted on the stationary plate should begin to separate at this point. If they do not, loosen the lock screw in the center of the breaker cam and rotate the cam until contacts begin to separate. Tighten the lock screw. The second set of contacts should separate 45° after this point when piston No 4 entering power stroke reaches firing position. Check firing interval with synchronizing tool which is Delco-Remy Part No 822572. Remove regular firing cam and replace with tool placing tool on shaft so that fiber bumper of contact arm mounted on stationary plate rests in notch. If fiber bumper of second contact arm does not rest in the other notch, loosen the lock screws and turn the eccentric adjusting screw until the fiber bumper is in the notch. Then tighten the lock screws.

Valve Timing:—INLET VALVES open 4° past top dead center and close 51° past lower dead center. EXHAUST VALVES open 47° before lower dead center and close at top dead center.

Firing Order:—The firing order is 1-4-7-3-8-5-2-6.

Spark Plugs:—Spark plugs are 7/8-18 SAE. Gaps are 0.025-0.028 inch.

STARTER:—Model MR-4101. Starter is connected to the engine through an out-board Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model SW-4001. Brush spring tension is 1 1/4-1 1/2 pounds each. Starter cranks the engine at 140 RPM drawing 100 amperes at 6 volts.

Starter Data			
Torque	RPM	Volts	Amperes
0 lb. ft.	Free	5.9	60 (Without Bendix)
0 "	Free	5.8	70 (With Bendix)

HUPMOBILE **SERIES E-3 (1927)** **AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO-REMY IGNITION**

Continued from preceding page.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GXB-4201. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen commutator cover band and shift third brush by tapping on third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any desired position by friction between the mounting stud and the generator endplate. Maximum charging rate is 18 amperes (cold) at 8 volts reached at 1200 R.P.M. or 21.2 M.P.H.

Generator Data (Car Setting)

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	550	2	7.2	620
5	7.0	650	5	7.4	700
10	7.3	780	10	7.7	900
16-18	7.7	1200	14	8.2	1600

Generator motoring draws 5.3 amperes at 6 volts. Shunt field draws 2.5 amperes at 6.2 volts directly across field terminals. Each coil draws 10 amperes at 6.2 volts when tested separately. Brush spring tension is 1¼-1½ pounds each.

Mounting:—Generator is flange mounted at right of engine on rear side of timing chain case. Generator drive is from timing chain which is adjusted by shifting generator in mounting slots. To adjust chain loosen the three flange mounting cap screws and shift generator around screw nearest engine block as a pivot until proper adjustment is secured. A set screw is provided to hold adjustment. The timing chain must not be too tight. To remove generator, disconnect generator lead and water pump coupling. Then loosen timing chain adjustment set screw and remove three flange mounting cap screws. Slide generator to rear and lift from place.

RELAY:—Model CB-4009. Relay is mounted on the generator. Relay closes at 550 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Clum Switch Model 10612. Switch is mounted at base of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Side lamps are 6-8 volt, 3 cp. S.C. Dash, tail, dome and corner lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

JORDAN MODEL R 'LITTLE CUSTOM SIX' (1927) SERIES DE000S AND SD000S AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Willard, Type WR-13, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model IG-4065. Distributor Model IGA-4013. Breaker contacts separate .018 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 15°. Automatic advance begins at 300 R.P.M. and reaches a maximum of 15° at 2800 R.P.M. Breaker arm spring tension is 18-20 ounces. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on top of the cylinder block and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then remove screw from manual advance arm and lift distributor from place.

Oiling:—Put 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles. At the same time put 5 drops of oil in the oiler on the end of the breaker cam shaft in the distributor head. Every 3000 miles put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $1\frac{3}{8}$ inches before top dead center (on the flywheel) with the spark control lever in the fully advanced position. To set timing crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Make certain that the manual advance lever is in the fully advanced position. Then remove the clutch inspection plate and continue to crank engine until the mark 'IGN' on the flywheel is under the pointer stud in the flywheel case. This mark is $1\frac{3}{8}$ inches before the top dead center mark. The breaker contacts should begin to separate at this point. Loosen the manual advance arm clamp screw and rotate the distributor cup until the contacts begin to separate. Tighten the clamp screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, $1\frac{9}{16}$ inches; stem diameter, .34025-.33925 inch; valve length, $5\frac{11}{32}$ inches (from top of seat to end); valve lift, $5/16$ inch; spring pressure, 103 pounds; tappet clearance, .004-.006 inch (hot); inlet valves open 5° after top dead center and close 45° after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{7}{16}$ inches; stem diameter, .34025-.33925 inch; valve length, $5\frac{11}{32}$ inches (from top of seat to end); valve lift, $5/16$ inch; spring pressure, 103 pounds. Exhaust opens 40° before lower dead center and closes 5° after top dead center. This point is marked on the flywheel '1-EX-CL'. Valve stem guides are removable. Oversize valve stems are made on order.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Champion No. 4. Gaps are .030 inch.

STARTER:—Model MN-4124. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is $1\frac{1}{4}$ - $1\frac{1}{2}$ pounds each. Starter switch is Model SW-4002.

16	79	1200	14	1600
19	80	1300		

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 3.8 amperes at 62 volts. Brush spring tension is $1\frac{1}{4}$ - $1\frac{1}{2}$ pounds each.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and loosen chain adjustment jamb nut and adjusting screw on side of generator flange. Then remove two flange mounting cap screws and slide generator to the rear.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles.

RELAY:—Model CB-4011. Relay is mounted on top of the generator. Relay closes at 620-690 R.P.M. when the generator voltage reaches 7-7.5 volts, and open with a discharge current of $\frac{1}{2}$ - $2\frac{1}{2}$ amperes each. Charging current is 2 amperes at closing of contacts. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Kellogg Switch Model 409. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Auxiliary head lamps are 6-8 volt, 3 cp. S.C. Dome lamp is 6-8 volt, 6 cp. S.C. Instrument board lamps and tail lamp are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the dash. It protects the lighting circuits.

JORDAN

MODEL AA (1927)

AMERICAN BOSCH GENERATING, STARTING AND LIGHTING SYSTEM AMERICAN BOSCH IGNITION

BATTERY:—Willard, CRR-17, 6 volt. Starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 23 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model TC-30. Distributor Model T-8202. Breaker contacts separate .014-.016 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Ignition current is 1.3 amperes with engine running and 3-4.5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 15°. Automatic advance begins at 200 R.P.M. and reaches a maximum of 15° at 2800 R.P.M. Breaker arm spring tension is 18-20 ounces.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on top of the engine block and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then remove screw from manual advance arm and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every month or each 1000 miles. Put one drop of oil on the breaker arm pivot pin and place a small bit of heavy grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 1½ inches (on the flywheel) before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever and continue to crank engine until the mark 'IGN' on the flywheel is opposite the pointer in the flywheel case. This mark is 1½ inches before the top dead center mark 'DC'. If breaker contacts do not separate at this point, loosen advance lever clamp screw and rotate distributor housing until contacts begin to separate. This can be checked by connecting a six volt lamp in ignition circuit or by watching dash ammeter. Tighten the clamp screw after making the adjustment and see that the rotor is opposite the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1⅝ inches; stem diameter, .3715-.3705 inch; valve length, 6 1/32 inches (from top of seat to end); valve lift, 5/16 inch; spring pressure, 60 pounds on the outer spring and 20 pounds on the inner or a total of 80 pounds; tappet clearance, .006-.004 inch (hot); inlet valves open 12° past top dead center and close 40° after lower dead center. EXHAUST VALVES:—Head diameter, 1½ inches; stem diameter, .3715-.3705 inch; valve length, 6 1/32 inches (from top of seat to end); valve lift, 5/16 inch; spring pressure, 60 pounds on the outer spring and 20 pounds on the inner or a total of 80 pounds; tappet clearance, .006-.004 inch (hot); exhaust valves open 40° before lower dead center and close 8° after top dead center. This point is marked on the flywheel by the mark '#1-EX.CL.' Valve stem guides are removable. Oversize valve stems are made on order.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 inch. Gaps are .025 inch.

STARTER:—Model 937. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model S-203. Brush spring tension is 1½ pounds each. Starter cranks the engine at 93 R.P.M.

Starter Data			
Torque	R.P.M.	Volts	Amperes

9.5	7.6	2800	9	7.0	2800

Motoring freely, generator draws 6 amperes at 6 volts. Shunt field current is 6.1-6.8 amperes at 6 volts. Brush spring tension is 1½ pounds.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Relay is mounted on top of the generator. Relay closes at 500-600 R.P.M. when the generator voltage reaches 6.5-7.5 volts and opens with a discharge current of 0.3 amperes at 400-500 R.P.M. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Kellogg Switch Model 404. Head and stop lamps are each 6-8 volt, 21 cp. S.C. Auxiliary head lamps are 6-8 volt, 6 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch. It protects the lighting and horn circuits. Ignition current does not pass through the circuit breaker.

FUSES:—Generator field fuse is 7.5 amperes.

JORDAN

American Bosch System

Plate 1276A

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

JORDAN MODEL J (1927) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Willard, Type CWR-15, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model CE-4003. Distributor Model IB-4004A. Breaker contacts separate .018-.022 inch. They are made of tungsten. Resurface contacts with a fine flat jeweler's file or on a medium hard oilstone. Ignition current is 1.3 amperes with engine running and 3-4.5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 14°. Automatic advance begins at 200 R.P.M. and reaches a maximum of 14° at 2800 R.P.M.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on top of the engine block and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then remove screw from manual advance arm and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every month or each 1000 miles. At the same time put one drop of oil on the breaker arm pivot pin and put a small bit of heavy grease on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 1½ inches (on the flywheel) before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever and continue to crank engine until the mark 'IGN' on the flywheel is opposite the pointer in the flywheel case. This mark is 1½ inches before the top dead center mark 'D.C.'. If breaker contacts do not separate at this point, loosen advance lever clamp screw and rotate distributor housing until contacts begin to separate. This can be checked by connecting a six volt lamp in ignition circuit or by watching dash ammeter. Tighten the clamp screw after making the adjustment and see that the rotor is opposite the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1½ inches; stem diameter, .3095-.3085 inch; valve length, 5 61/64 inches (from top of seat to end); valve lift, 5/16 inch; spring pressure, 61 pounds on the outer spring and 26 pounds on the inner or a total of 87 pounds; tappet clearance, .006-.004 inch (hot); inlet valves open 8° past top dead center and close 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1⅜ inches; stem diameter, .3095-.3085 inch; valve length, 5 61/64 inches (from top of seat to end); valve lift 5/16 inch; spring pressure, 61 pounds on the outer spring and 26 pounds on the inner or a total of 87 pounds; tappet clearance, .006-.004 inch (hot); exhaust valves open 40° before lower dead center and close 8° after top dead center. This point is marked on the flywheel by the mark '±1-EX.CL'. Valve stem guides are removable. Oversize valve stems are made on order.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are Champion No. 4. Gaps are .030-.025 inch.

STARTER:—Model MUA-4003. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter switch is Model SW-3646. Brush spring tension is 1½ pounds each.

Torque		Starter Data		Volts		Amperes	
0 lb. ft.		2000		6		60	
22		Lock		3.5		500	

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting bolts. Then slide starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side

JORDAN

MODEL J (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

Continued from preceding page.

GENERATOR:—Model GAB-4002. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Maximum charging rate is 17.5 amperes reached at 1300 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.

14.....	7.8.....	950	13.....	8.0.....	1400
17.....	8.0.....	1300	11.....	7.8.....	2000
13.....	7.8.....	1950			

Generator motoring draws 6 amperes at 6 volts. Shunt field current is 6.6 amperes at 6 volts. Brush spring tension is $1\frac{1}{2}$ - $1\frac{3}{4}$ pounds each.

Mounting:—Generator is flange mounted on right of engine on rear face of timing chain case. To remove generator, disconnect generator lead and remove three nuts from flange mounting screws. Then slide generator to the rear. This does not change timing chain adjustment.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model CB-4012. Relay is mounted on top of the generator. Relay closes at 600-650 R.P.M. when voltage of the generator reaches 6.5-7.5 volts, and opens with a discharge current of 1-3 amperes. Charging current at closing of contacts must not be over 2 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Kellogg Switch Model 404. Head and stop lamps are each 6-8 volt, 21 cp. S.C. Auxiliary head lamps are 6-8 volt, 6 cp. S.C. Dome lamp is 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker protects the lighting circuits. The ignition current does not pass through the circuit breaker.

FUSES:—Generator field fuse is 7.5 amperes.

JORDAN
Model J. (1927)
Auto-Lite System

Plate 1277A

FORD
MODEL A (1928)
FORD GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE COIL, AMERICAN BOSCH DISTRIBUTOR

BATTERY:—Ford, 6 volt, 80 ampere hour. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16 hours. The positive (+) terminal is grounded. Battery is mounted on left frame member under the floor boards of the front compartment. The terminal assembly is opposite to that of the battery used on the Model T and for this reason the two batteries are not interchangeable.

IGNITION:—Breaker contacts separate .018-.022 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of the manual type. Maximum manual advance is 20°. Breaker arm spring tension is 14-20 ounces. Ignition current is 6 amperes at 7 volts with engine running and 4.2 amperes at 6 volts with engine stopped.

Oiling:—There is an oiler on the side of the distributor housing. Put a few drops of light engine oil in this oiler every 1000 miles. At the same time wipe the face of the breaker cam with medium heavy cup grease.

Mounting:—Ignition coil is mounted on the engine side of the dash. Distributor is mounted on top of the engine between cylinders 2 and 3. Breaker mounting plate can be removed by removing distributor cap and removing lock screw in center of breaker cam and the breaker cam. Turn plate until groove and projection on housing line up. Then lift breaker plate from place. The ignition circuit is theft-proof with the breaker lead run from the switch to the breaker in an armored cable. It will not be necessary to remove the distributor housing from the cylinder head but this can be done by disconnecting the advance rod and all connections and removing the stud and locknut on the side of the engine block. The ignition switch and distributor housing must be removed as a unit.

Timing:—Breaker contacts separate when the piston entering power stroke reaches top dead center. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. This is the upstroke with both valves closed. Then loosen screw in center of breaker cam and rotate cam until contacts begin to separate. Tighten the screw.

Firing Order:—The firing order is 1-2-4-3.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 2 pounds.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2700	6	50
14 "	Lock	3.75	560

Oiling:—Starter bearings are oilless. They require no attention.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel case. To remove starter, disconnect starting pedal and cable from starter switch. Then remove three flange mounting screws and pull starter forward. When clear of housing lift starter from place.

GENERATOR:—The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover cap and loosen the small screw holding the third brush on the fiber mounting ring. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Generator brush spring tension should be 12-16 ounces each.

Generator Data		
Amperes	Volts	R.P.M.
12	7	1500

Generator motoring draws 2.5-3 amperes at 6 volts. Shunt field current is 2 amperes at 6 volts. Generator stalled draws 22 amperes at 6 volts.

Continued on reverse side

FORD
MODEL A (1928)
FORD GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE COIL, AMERICAN BOSCH DISTRIBUTOR

Continued from preceding page.

Oiling:—Generator is equipped with ball bearings packed with cup grease. The grease compartment forms a hollow hub inside the armature and holds sufficient grease so that replenishing is necessary only infrequently. To repack grease compartment it is necessary to remove drive pulley and end cap.

Mounting:—Generator is mounted on left of engine at forward end of engine by special swinging bracket and is belt driven from the crankshaft by the fan belt. To remove generator, disconnect lead and loosen bolts on adjustment bracket and mounting lug under generator. Then swing generator toward engine and slip off drive belt. Remove mounting bolts and lift generator from place. The tension of the drive belt is adjusted by swinging generator on the lower mounting lug. To adjust belt, loosen lower mounting bolt and the bolt on the adjustment bracket extending from the generator to the crankcase. Then swing the generator on the lower bolt as a pivot until the proper tension of the belt is secured and tighten the bolts. The belt must not be too tight or it will crowd the generator bearings.

RELAY:—The relay is mounted on top of the generator.

LIGHTING:—Headlights are standard Ford 6-8 volt, 21 and 2 cp. double filament bulbs using 2 cp. filaments for dimming. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C.

LA SALLE

SERIES 303 (1927) SERIAL NOS. 2-00001 to 2-12000 DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-XC-15-I-G, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 minutes. The positive (+) terminal is grounded. Battery is mounted under the front seat on the right hand side.

IGNITION:—Coil Model 2195. Distributor Model 4023. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance starts at 600 R.P.M. (engine). Maximum automatic advance is 20° (engine) at 2800 R.P.M. Breaker arm spring tension is 16-20 ounces. There are two breakers on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation which is the correct firing interval for this engine. The firing interval must be accurately set. (See Timing.)

Mounting:—Ignition coil is mounted on side of distributor support. Distributor is mounted at front of engine between the cylinder banks. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables attached. Then remove hold-down screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Synchronizing of breaker contacts to secure firing interval must be done before ignition timing is set. To set firing interval, use Delco-Remy Part No. 72. Loosen taper screw in center of breaker cam and remove regular firing cam. Place synchronizing tool on shaft so that fiber bumper of contact arm mounted on stationary plate rests in notch of tool. If the fiber bumper of the other contact arm does not rest in the other notch, loosen the two lock screws on the mounting plate and turn the eccentric adjusting screw until the proper adjustment is reached. Tighten the lock screws and replace the regular firing cam. To set timing, crank engine until piston No. 1 entering power stroke reaches a position 7/8 inch (on the flywheel) before top dead center. At this point the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. The manual spark control lever must be in the fully advanced position.

NOTE:—A few of the first La Salle engines had the ignition mark 'IG/A-1-5' placed 1 3/16 inches before top dead center. On these engines the mark should be disregarded and the breaker contacts timed to separate 7/8 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 6 17/64 inches; valve lift, 25/64 inch; tappet clearance, .004 inch (cold); spring pressure, 133 pounds (compressed to 2 9/64 inches). Inlet valves open 11° 2' before top dead center and close 58° 38' after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 6 1/4 inches (over all); valve lift, 25/64 inch; tappet clearance, .006 inch (cold); spring pressure, 133 pounds (compressed to 2 9/64 inches). Exhaust valves open 38° 12' before lower dead center and close 7° 38' after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. No. 1 cylinder is nearest the radiator. Right hand block is right viewed from driver's seat.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .032 inch.

STARTER:—Model 725-B. Starter is connected to the engine through a mechanical gear shift connected to the starter pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is mounted on rear of flywheel housing on right side. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting cap screws. Then slide starter to rear and lift from place.

Oiling:—Starter is equipped with oilless bearings. They require no attention.

GENERATOR:—Model 3/0. The direction of rotation is counter-clockwise, looking at the commutator end. Generator is of split field type. A straight shunt field is wound on one pole piece with a thermostat in circuit. Thermostat contacts open at 175°F. opening the field circuit and rendering this field inoperative. A third brush shunt field is wound on the other pole. Generator output is adjusted by shifting the third brush. To adjust generator output, loosen the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by spring washers. The maximum charging rate of 18-22 amperes is reached at 1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-22	8.6	1600	12	7.4	1200

Third brush shunt field draws 4.25 amperes at 6 volts. Straight shunt field draws .75 amperes at 6 volts. Brush spring tension is 16-20 ounces.

Mounting:—Generator is mounted at right of engine and is driven in tandem with the water pump. To remove generator, disconnect battery wire and remove three mounting nuts. Then pull generator to rear.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at approximately 8 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0.25 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. double filament using lower 21 cp. filament instead of dimming system. Stop lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail and dome lamps are each 6-8 volt, 3 cp. S.C.

Switches:—Delco-Remy Lighting Switch Model 1313 is mounted at the foot of the steering column. Ignition switch is Model 1285.

CIRCUIT BREAKER:—Model 5759. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. It begins to operate with a current of 25-30 amperes and limits the current flow to 10-15 amperes. The lockout circuit breaker protects the horn, cigar lighter, stop light and body light circuits. It opens the circuit when the current reaches 25-30 amperes.

BATTERY:—Exide, Type 3-XC-15-I-G, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the front seat on the right side.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° at 2800 R.P.M. Breaker arm spring tension is 16-20 ounces. There are two breakers on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation which is the correct firing interval for the La Salle engine. The firing interval must be accurately set (see Timing).

Mounting:—The ignition system is equipped with an Electrolock switch. This must be removed from the car with the distributor when the distributor is to be taken from its mounting. To remove distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold-down screw and lift unit from place. The distributor is mounted at the front of the engine between the cylinder banks. The coil is mounted on the side of the distributor support.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—The breaker contacts must be synchronized to secure correct firing interval before the ignition timing is set. To set firing interval use Delco-Remy Part No. 822572. Loosen taper screw in center of breaker cam and remove regular firing cam. Place synchronizing tool on shaft so that fiber bumper of contact arm mounted on stationary plate rests in notch on tool. If the fiber bumper of the second contact arm does not rest in the other notch, loosen the two lock screws on the mounting plate and turn the eccentric adjusting screw until the proper adjustment is reached. Tighten the lock screws and replace the regular firing cam. To set timing, crank engine until piston No. 1 entering power stroke reaches a position 7/8 inch (on the flywheel) before top dead center. The flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel housing. Breaker contacts separate at this point. The manual spark control lever must be in the fully advanced position.

Valve Timing:—INLET VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 6 17/64 inches; valve lift, 25/64 inch; tappet clearance, .004 inch (cold); spring pressure, 133 pounds compressed to 2 9/64 inches. Inlet valves open 11° 2' before upper dead center and close 58° 38' after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/2 inches; stem diameter, 3/8 inch; stem length, 6 1/4 inches (over all); valve lift, 25/64 inch; tappet clearance, .006 inch (cold); spring pressure, 133 pounds compressed to 2 9/64 inches. Exhaust valves open 38° 12' before lower dead center and close 7° 38' after upper dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is IL-4R-4L-2L-3R-2R-1R. No. 1 cylinder is nearest the radiator. Right hand block is right viewed from driver's seat.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .032 inch.

TWIN VALVE SIX MODEL (1925-26-27)
DE JON GENERATING, STARTING AND LIGHTING SYSTEM
DE JON IGNITION

BATTERY:—Willard, Type SJRR-6, 6 volt. Starting capacity is 166 amperes for 20 minutes. Lighting capacity is 5 amperes for 31 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model CA-4011. Distributor Model IA-4011. Breaker contacts separate .018-.022 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of the manual type. Condenser is mounted in the distributor head and is of .20-.25 microfarads capacity. Ignition current is 6.3-6.5 amperes at 6 volts with resistance cold, decreasing to 3.5-3.6 amperes at 6 volts with ballast register hot. On bench test with De Jon distributor, maximum spark is .394 inch between needle points with breaker running at 1000 R.P.M. Distributor is of manual type. Maximum manual advance is 25°. Breaker arm spring tension is 20 ounces.

Note:—Distributor has been furnished with two types of breaker arms. First type breaker arm was not insulated at hinge stud and was grounded to breaker plate through copper pig tail. Later type distributor arm is insulated at hinge stud and is grounded through copper ground strip fastened by clamp and screw. The two types are not interchangeable.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor head every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 3-3.5° (on the flywheel) past top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. Fully retard spark control lever. Then loosen timing adjustment screw in center of breaker cam and rotate cam until breaker contacts begin to separate. Tighten the screw. Make certain that the rotor button is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—The McFarlan engine has two inlet and two exhaust valves in each cylinder. **INLET VALVES:**—Head diameter, 1 1/2 inches; stem diameter, .3715 inch; stem length, 8 13/64 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .007 inch (hot). Inlet valves open 3° 35' after top dead center and close 29° 40' before lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/8 inches; stem diameter, .3715 inch; stem length, 8 13/64 inches; valve lift, 5/16 inch; spring pressure, 60 pounds; tappet clearance, .012 inch (hot). Exhaust valves open 48° 6' after lower dead center and close 11° 41' before top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model SC-4001. Starter is connected to the engine through a Bendix drive, Type L-13-M-X. The direction of rotation is counter-clockwise, looking at the commutator end.

Starter Data			
Torque	R P M.	Volts	Amperes
0 lb. ft.	Free	5.0	50
1.8 "	1275	5.5	100
5.5 "	850	5.0	200
9.9 "	590	4.5	300
15.0 "	450	4.0	1400
44.0 "	Lock	4.0	1000
31.25 "	Lock	3.0	700

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

Continued on reverse side.

McFARLAN
TWIN VALVE SIX MODEL (1925-26-27)
DE JON GENERATING, STARTING AND LIGHTING SYSTEM
DE JON IGNITION

Continued from preceding page.

GENERATOR:—Model DE-4001. The direction of rotation is clockwise, looking at the commutator end. Generator current is by third brush shunt field. To adjust generator output, insert a screwdriver in the slotted third brush shifting shaft extending through to the outside of the generator endplate and shift the third brush by turning the shaft. Turning the shaft to the left or in a counter-clockwise direction increases the charging rate and in a clockwise direction decreases the charging rate. With maximum setting, generator output is 17-18 amperes at 8 volts reached at 1500-1600 R.P.M.

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
6.....	500	4.....	500
10.....	600	7.....	600
12.....	800	9.....	800
15.....	1000	12.5.....	1000
16.....	1200	12.5.....	1200
14.....	1600	11.....	1600
10.....	2800	8.....	2800

Shunt field current is 2.5 amperes at 6 volts. Brush spring tension is $1\frac{1}{2}$ -2 pounds. A five ampere fuse mounted on the generator endplate protects the field circuit. No other size fuse should be used to replace it.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Model RA-4001-A. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts at 625 R.P.M. and open with a discharge current of .5-2.5 amperes. Maximum charging current at closing of contacts is 5 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Clum Switch Model 10471. Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps are 6-8 volt, 14 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Corner lamps and dome lamp are each 6-8 volt, 4 cp. D.C. Step lamp is 6-8 volt, 4 cp. D.C. Side lamps are 6-8 volt, 4 cp. S.C. Dash, tonneau and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 30 amperes.

 De Jon System

SERVICE ENGINEERING COMPANY SAN FRANCISCO—CALIF. U. S. A. 1927

MCFARLAN EIGHT IN LINE MODEL (1925-1926) DELCO GENERATING, STARTING AND LIGHTING SYSTEM DELCO IGNITION

BATTERY:—Willard, Type SJRR-4, 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Co.1 Model 2178. Distributor Model 5286. Breaker contacts separate .020-.25 inch. They are made of tungsten. Resurface contacts on a medium hard oilstone or with a fine flat contact file. Distributor is of the semi-automatic type. Manual advance is 40° (engine). Automatic advance begins at 600 R.P.M. and reaches a maximum of 18-24° at 2000 R.P.M. Breaker arm spring tension is 16-20 ounces.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever and breaker assembly in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center entering power stroke. Fully retard spark control lever. Loosen timing screw in center of breaker cam and rotate cam until breaker contacts begin to separate. Tighten the screw. Make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1. This system uses two sets of contacts with a four sided cam, contacts opening alternately at intervals of 45° (distributor) corresponding to 90° of crankshaft rotation. Contact opening must be accurately set. Check timing of second set of contacts by special synchronizing tool which is Delco-Remy Part No. 822572. Loosen screw in center of breaker cam and remove regular firing cam. Place synchronizing tool on shaft so that fiber bumper of contact arm mounted on stationary plate rests in notch in plate. Then loosen lock screws and turn eccentric adjusting screw until fiber bumper of second contact arm rests in the other notch of the tool. Tighten the lock screw and replace the firing cam.

Valve Timing:—INLET VALVES:—Head diameter, 1 9/32 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch; spring pressure, 62 pounds; tappet clearance, .006-.008 inch (hot). Inlet valves open at top dead center and close 35° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch; spring pressure, 62 pounds; tappet clearance, .006-.008 inch (hot). Exhaust valves open 42° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Overize valve stems are not made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 313. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4.0	60
2 "	1750	5.5	175
13 "	Lock	3.0	450

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 256. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush mounting plate by means of the handle on the plate. Shift the third brush in a clockwise direction to increase charging rate and in the opposite direction to decrease the charging rate. The brush and mounting plate are held in any position by friction washers. Generator brush tension is 1 1/4-1 3/4 pounds each.

DELCO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO IGNITION

Continued from preceding page.

Generator Data

Amperes	RPM
4	800
15-17	1600

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks.

RELAY:—Relay is mounted on the generator. Relay closes when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0.3 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING:—**Switch Model 1246.** Head lamps are 6-8 volt, 21 cp double filament using second 21 cp. filament for dimming. Stop lamp is 6-8 volt, 15 cp S.C. Corner lamps and dome lamp are each 6-8 volt, 4 cp. D.C. Side lamps are each 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp S.C. Tonneau lamp is 6-8 volt, 3 cp. D.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this device to operate limiting the current to 10-15 amperes.

FUSES:—Fuses in body light circuits are 10 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

McFARLAN **EIGHT IN LINE MODEL (1927)** **DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO-REMY IGNITION**

BATTERY:—Willard, Type SJRR-4, 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 525-A. Distributor Model 658-A. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 15° (engine). Automatic advance begins at 300 R.P.M. of engine. Maximum automatic advance is 15° (engine) reached at 1800 R.P.M. Breaker arm spring tension is 15-20 ounces. Breaker has two sets of contacts on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This firing interval must be accurately set (see Timing).

Oiling:—Fill the grease cup on the side of the distributor housing with medium cup grease and turn down two turns every month or each 1000 miles. Remove the rotor and saturate the wick in the oiler in the shaft with light engine oil every 1000 miles. At the same time put a small bit of vaseline on the face of the breaker cam.

Timing:—Before setting timing, check timing for correct firing interval of contacts. Use special synchronizing tool which is Delco-Remy Part No. 820738. Set contact opening at .022 inch and place tool on shaft locking it in position by pushing the slide in until the arrow on the slide points in the direction of rotation. Then rotate the distributor shaft until contacts mounted on stationary plate begin to separate. Note scale reading on leading scale opposite edge of terminal block on housing and turn shaft until same reading on second scale is opposite the same point on the housing. If second set of contacts do not separate at this point loosen lock screws and turn eccentric adjusting screw until contacts begin to separate. Tighten the lock screws.

Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with all valves closed). Then fully retard spark control lever. If contacts are not separating, loosen advance arm clamp screw and rotate distributor until one set of contacts begin to open. Tighten the clamp screw and make certain that the segment opposite the rotor button is connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1 9/32 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch; spring pressure, 36 pounds; tappet clearance, .006-.008 inch (hot). Inlet valves open at top dead center and close 35° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch; spring pressure, 36 pounds; tappet clearance, .006-.008 inch (hot). Exhaust valves open 42° before lower dead center and close 5° after top dead center.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 720-YX. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Oiling:—Put 4 or 5 drops of light engine oil in the starter bearing oiler every month or each 1000 miles.

EIGHT IN LINE MODEL (1927)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 941-S. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 160°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the endplate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 20 amperes at 8.3 volts reached at 1450 R.P.M.

Generator Data

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
0	6.5	575			
2	7.25	675	12	7.5	2000
7	7-7.3	750			
21	8.3-8.5	1450			

Motoring generator draws 5-5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces each.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2 amperes. Contacts separate .015-.025 inch. Air gap is .018-.022 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1246. Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dash, tail, corner and auxiliary head lamps are each 6-8 volt, 3 cp. S.C. Dome lamp is 6-8 volt, 3 cp. D.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch to protect the lighting circuits. A current of 25-35 amperes will cause this device to operate. While vibrating the current is 10-15 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

NASH ADVANCED SIX SERIES 360 (1927-28) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard Type SJWR-4, 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. The positive (+) terminal is grounded. Battery is mounted on right frame member under the front floor boards.

IGNITION:—Coil Model 525-C. Distributor Model 636-M. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Manual advance is 33° (flywheel). Automatic advance begins at 500 R.P.M. and reaches a maximum of 22° (flywheel) at 1600 R.P.M. of the engine. Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted at left of engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables attached. Then remove set screw on distributor shaft housing and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small bit of grease on the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. With No. 1 piston in firing position the 'V' notch in the flywheel will be opposite the indicator in the flywheel case. To set timing, crank engine until piston No. 1 reaches this position. Make certain that the spark lever is fully retarded. Then loosen the advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 19/32 inches; stem diameter, .3725 inch; stem length, 4 3/8 inches; valve lift, .348 inch; tappet clearance, .010 inch (hot); spring pressure, 55 pounds main spring, 15 pounds auxiliary spring—total 70 pounds (valve open). Inlet valves open 15° after top dead center and close 38° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, .3725 inch; stem length, 4 3/8 inches; valve lift, .348 inch; tappet clearance, .010 inch; spring pressure, 55 pounds main spring, 15 pounds auxiliary spring—total 70 pounds (valve open). Exhaust valves open 45° before lower dead center and close 10° after top dead center. Valve stem guides are removable. Oversize valve stems are not made. Top dead center for pistons Nos. 1 and 6 is marked on the flywheel by 'V' notch.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025-.030 inch.

STARTER:—Model 726-B. Starter is connected to the engine through a mechanical pinion shift connected to the starting switch. A disc clutch is provided to prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces. Starter cranks the engine at 160 R.P.M. drawing 215 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect pedal rod and pedal return spring and remove pilot mounting screw directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side.

ADVANCED SIX SERIES 360 (1927-28)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 373. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by special straight shunt field and thermostat combined with third brush shunt field. The thermostat contacts open at 180-190°F. opening the straight shunt field circuit and allowing the generator to operate with the third brush shunt field only. Each field is wound on one field pole. To adjust generator output, remove commutator cover band and shift third brush. Shift the third brush in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in any position by friction washers. The maximum charging rate is 22 amperes (cold) at 8.5 volts reached at 1500 R.P.M. or approximately 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
22	8.5	1500	17-19	7.6	2100

Generator motoring draws 8 amperes at 6 volts. Third brush shunt field current is 2.75-3 amperes at 6 volts. Straight shunt field current is .5 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is mounted at front of engine. To remove generator, remove two flange mounting screws and lower generator until belt can be removed.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—No relay is used. The generator is connected to the battery through the ignition switch. When the ignition is cut off, the generator is disconnected, preventing the battery discharging through the generator windings.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Side lamps are 6-8 volt, 3 cp. S.C. Dash, dome, tonneau and tail lamps are each 6-8 volt, 3 cp. S.C.

Switches:—Delco-Remy Lighting Switch Model 1300 is mounted at the base of the steering column. Ignition Switch Model 1299 is mounted on the dash.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the ignition switch. Circuit breaker cuts in at 25-30 amperes limiting the current flow to 10-15 amperes. The generator current and ignition current do not go through the circuit breaker.

PAIGE MODEL 8-85 (1927) SERIAL NOS. 500,001 UP DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Westinghouse, Type 6-0B-15, 6 volt, 135 ampere hour. Starting capacity is 133 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The positive (+) terminal is grounded. Battery is mounted under the right front seat.

IGNITION:—Coil Model 525-A. Distributor Model 658-A. Breaker contacts separate 018-024 inch. Resurface contacts whenever necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 15° (engine). Automatic advance begins at 300 RPM (engine). Maximum automatic advance is 17° (engine) reached at 2000 RPM. Breaker arm spring tension is 17-21 ounces. Ignition current is 1.3 amperes with engine running and 3.4-5 amperes with engine stopped. Two sets of breaker contacts are used. They operate on a four sided cam and open alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This firing interval must be accurately set for correct ignition. (See Timing)

Mounting:—Ignition coil is mounted on the generator. Distributor is mounted on cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables attached. Then loosen distributor clamp screw and lift unit from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor button and saturate the wick oiler with light engine oil. Put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 11° 28' after top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Make certain that the spark control lever is in the fully retarded position. Then crank engine over 11° 28'. The stationary set of breaker contacts should separate at this point. To set contacts, loosen distributor clamp screw and rotate distributor cup until contacts begin to separate. Tighten the clamp screw. To check contacts for correct firing interval use Delco-Remy Part No. 820738. Place the synchronizing tool on the shaft locking it in place with the slide pushed in so that the arrow visible on the slide points in the direction of rotation. Then turn shaft until contacts mounted on stationary plate begin to separate. Note reading on leading scale opposite the edge of the primary terminal on the edge of the distributor cup. Continue to turn shaft until same reading on second scale is opposite the same point on the cup. If second set of contacts are not separating, loosen lock screws on mounting plate and turn eccentric adjusting screw until contacts separate. Tighten the lock screws and check the contact opening. If it is not within limits of 018-024 inch with contact arm on lobe of cam, the gap must be set at .022 inch and the operation repeated.

Valve Timing:—INLET VALVES —Head diameter, 1 7/16 inches, stem diameter, 11/32 inch, stem length, 47/8 inches, tappet clearance, .010 inch (hot), spring pressure, 58-62 pounds, valve lift, 5/16 inch. Inlet opens on top dead center and closes 35° after lower dead center.

EXHAUST VALVES —Head diameter, 1 5/16 inches, stem diameter, 11/32 inch, stem length, 47/8 inches, tappet clearance, .010 inch (hot), spring pressure, 58-62 pounds, valve lift, 5/16 inch. Exhaust opens 42° before lower dead center and closes 5° after top dead center. Valve stem guides are removable. Oversize valve stems are made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 SAE Regular. Gaps are .025 inch.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 140 RPM, taking 200 amperes at 5 volts. Starter brush tension is 24-28 ounces. Starter switch is Model 404-U.

PAIGE

MODEL 8-85 (1927) SERIAL NOS. 500,001 UP

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted on right side of engine on forward side of fly-wheel housing. To remove starter, disconnect cable and remove three flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

GENERATOR:—Model 945-F. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system combined with a thermostat. Thermostat contacts open at 165°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the generator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate is 18-20 amperes reached at 1800 R.P.M. or 40 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	7.0	700			
12	7.8	1000	11	7.7	1500
18-20	8.0	1300			

Shunt field current is 5 amperes at 6 volts. Running as a motor, generator draws 5-5.5 amperes at 6 volts. Brush spring tension is 22-28 ounces each.

Mounting:—Generator is mounted on right side of engine by special mounting.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles if the car is driven more than 1000 miles in a month.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 600-650 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens with a discharge current of 0.2-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.020 inch, contacts closed.

LIGHTING:—Remy Lighting Switch Model 420-F. Switch is mounted on the base of the steering column. Head lamps are each 6-8 volt, 21 cp. S.C. Side lamps are 6-8 volt, 3 cp. S.C. Dash lamp is 6-8 volt, 2 cp. D.C. Tail lamp is 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes.

Auto-Lite System

Plate 1287

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED 1927

PEERLESS MODEL 6-60 (1927) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-5X. Starting capacity is 106 amperes for 20 minutes. Lighting capacity is 5 amperes for 184 hours. The positive (+) terminal is grounded. Battery is mounted on the left frame member under the floor boards of the front compartment.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4012. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30° (engine). Automatic advance begins at 400 RPM (engine). Maximum automatic advance is 25° (engine) reached at 3100 RPM. Breaker arm spring tension is 16 ounces. Ignition current is 1-3 amperes at 6.5-6.8 volts with engine running and 4-5 amperes at 6.2 volts with engine stopped.

Mounting:—Distributor is mounted on the cylinder head and is driven by extension of oil pump shaft. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables attached. Then remove hold down screw in advance arm and lift distributor from place.

Oiling:—Put 8 to 10 drops of light engine oil in the oiler on the side of the distributor shaft every two weeks or each 500 miles. Every 1000 miles put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position before top dead center when the flywheel mark 'IGN' is opposite the indicator with manual advance lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Make certain that manual advance lever is fully advanced and remove flywheel housing hand hole cover. Then continue to crank engine until 'IGN' mark on flywheel is under the pointer. If breaker contacts do not separate at this point, loosen advance arm clamp screw and rotate distributor in a clockwise direction until contacts begin to separate. Tighten the clamp screw.

Valve Timing:—INLET VALVES open 5° past top dead center and close 45° past lower dead center. Tappet clearance is .004 inch (hot).

EXHAUST VALVES open 40° before lower dead center and close 5° past top dead center. Tappet clearance is .006 inch (hot).

To set camshaft, crank engine until piston No. 1 is on top dead center with flywheel mark 'No. 1 DC' opposite pointer under flywheel housing hand hole cover. Turn camshaft until there are exactly eleven links (on timing chain) between timing mark on crankshaft sprocket and camshaft sprocket and assemble chain in place.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 SAE Standard. Gaps are .025 inch.

STARTER:—Model MN-4128. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 RPM drawing 120 amperes at 5.5 volts. Brush spring tension is 1 1/4-1 1/2 pounds. Starter switch is Model SW-4105.

Starter Data			
Torque	RPM	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)
0 "	Free	5.5	50 (With Bendix)
6 "	2700	5.5	100
25 "	1500	5.0	200
5 "	850	4.5	300
7.5 "	650	4.0	400
135 "	Lock	3.0	540

Mounting:—Starter is mounted by SAE No. 1 flange mounting at left of engine on forward side of flywheel housing. To remove, disconnect cable and remove three flange mounting capscrews. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side

MODEL 6-60 (1927)

AUTO-LITE IGNITION

GENERATOR:—Model GYA-4207. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush mounting bracket by tapping on the third brush stud with a screwdriver. Shifting the third brush in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. The mounting bracket is held in any desired position by friction between the mounting stud and the endplate. The maximum charging rate is 17-19 amperes (cold) at 8 volts reached at 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	620	2	6.6	700
5	7.0	700	5	7.0	840
10	7.3	860	10	7.3	1100
14	7.7	1050	14	7.7	1600
16	7.9	1200			

Generator motoring draws 5.32-5.88 amperes at 6.2 volts. Shunt field current is 1.9-2.1 amperes at 6.2 volts. Brush spring tension is 1½-2 pounds each. A five ampere field fuse is mounted on the generator endplate.

Mounting:—Generator is mounted at right of engine on rear of timing chain case by special flange mounting. To remove generator, disconnect lead and remove generator sprocket cover on front of chain case. Then remove cotter and nut from generator shaft. Loosen the chain adjustment set screw and remove two flange mounting cap screws. Pull the generator to the rear leaving the sprocket in the chain case. Do not crank engine while the generator is out or the valve timing will be disturbed.

Timing chain is adjusted by shifting generator. To adjust chain tension, loosen two flange mounting capscrews and shift generator position by turning up the set screw. Do not set chain too tight. Make adjustment with engine running, turning up set screw until chain begins to hum. Then back set screw off slightly until humming stops and tighten capscrews.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler on the commutator end of the generator every two weeks or each 500 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model CB-4011. Relay is mounted on the generator. Relay contacts close at 875 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Contacts separate .025-.035 inch. Air gap* is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch Model 10592. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side lamps are 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Dash, dome and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

BATTERY:—Exide, Type 3-XC-15-1, or Willard, Type XR-15, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted on the frame at the right of the car.

IGNITION:—Coil Model 2178. Distributor Model 5267. Breaker contacts separate .020-.0275 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance begins at 500 R.P.M. and reaches a maximum of 19-23° at 2000 R.P.M. Total manual and automatic advance is 53°. Breaker arm spring tension is 13-16 ounces.

Mounting:—Distributor is mounted at left of engine. To remove distributor, disconnect primary lead and manual advance control rod and remove distributor head with high tension cables intact. Remove advance lever stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease or vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15° before top dead center (measured on the flywheel) with the manual advance rod in the fully advanced position. To set timing, fully advance spark control lever and crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until the piston reaches a position 15° before top dead center. At this point the mark on the flywheel will be opposite the indicator on the flywheel case. Then loosen the advance lever clamp screw and rotate distributor housing until breaker contacts begin to separate. Then tighten the clamp screw. Make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/16 inches; stem diameter, .370 inch; valve length, 6 1/4 inches; valve lift, 11/32 inch; tappet clearance, .0075 inch; spring pressure, 110-120 pounds. Inlet valves open at top dead center and close 50° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/16 inches; stem diameter, .370 inch; valve length, 6 1/4 inches; valve lift, 11/32 inch; tappet clearance, .0075 inch; spring pressure, 110-120 pounds. Exhaust valves open 50° before lower dead center and close at top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 282. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 2 1/4-2 1/2 pounds each. Starter switch is Model 1953.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
11 "	Lock	2.8	570

Mounting:—Starter is barrel mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove large pilot mounting screw. Then slide starter forward from place.

Oiling:—Oilless bearings are used. They require no attention.

GENERATOR:—Model 284. The direction of rotation is counter-clockwise, looking at the commutator end. To adjust the charging rate, remove the commutator band and shift the third brush by means of the handle on the third brush mounting plate. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any desired position by friction washers. Maximum charging rate of 18 amperes is reached at 1600 R.P.M. or 28 M.P.H.

Continued from preceding page.

Generator Data		
Amperes		R.P.M.
0		700
17-20		1600

Generator motoring draws 6 amperes at 6 volts. Shunt field current is 3.3 amperes at 6 volts. Generator brush spring tension is $1\frac{3}{4}$ pounds.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove three flange mounting cap screws. The lower screw may be removed through a hole in the pan provided for this purpose. Then slide the generator to the rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 5754. Relay is mounted on top of the generator. Relay closes at 8 M.P.H. when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .030 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING:—Delco Switch Model 1260. Head lamps are 6-8 volt, 21 cp. S.C. Dimming is by resistance on switch. Side lamps are 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this to operate. While vibrating, the current is 10-15 amperes.

AUTO-LITE IGNITION

BATTERY:—U.S.L. Type XY-15X-6, 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The positive (+) terminal is grounded. Battery is mounted on the frame at right of the car.

IGNITION:—Coil Model IG-4065. Distributor Model IG-4118. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1.5 amperes with engine running and 4.5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 20°. Maximum automatic advance is 20°.

Mounting:—Distributor is mounted on the right side of the engine forward of the generator. To remove distributor, loosen lock nut and remove set screw on side of distributor mounting bracket. Then lift distributor from place.

Oiling:—Refill the grease cup on the side of the distributor housing with medium cup grease and turn down two turns every two weeks or each 500 miles. Every 1000 miles put one drop of light engine oil on the breaker arm pivot pin. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position two teeth on the flywheel before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (this is the upstroke with both valves closed). Remove the clutch inspection plate and continue to crank engine until the second tooth on the flywheel before the top dead center mark is opposite the indicator on the flywheel case. Make certain the manual spark control lever is in the fully advanced position. Then loosen the clamp screw on the advance arm and rotate the distributor cup until the contacts begin to separate. Tighten the clamp screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1 $\frac{5}{8}$ inches; stem diameter, .370-.371 inch; valve length, 5 $\frac{45}{64}$ inches; valve lift, 5/16 inch; spring pressure, 75-80 pounds; tappet clearance, .006 inch. Inlet valves open 4° after top dead center and close 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 $\frac{5}{8}$ inches; stem diameter, .370-.371 inch; valve length, 5 $\frac{45}{64}$ inches; valve lift, 5/16 inch; spring pressure, 75-80 pounds; tappet clearance, .006 inch. Exhaust opens 41° before lower dead center and closes 1° after top dead center. Valve stem guides are removable.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MN-4114. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 130 amperes at 5.2 volts. Starter switch is Model SW-4001. Brush spring tension is 1 $\frac{1}{4}$ -1 $\frac{1}{2}$ pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (Without Bendix)

PEERLESS

MODEL 6-80 (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

Continued from preceding page.

GENERATOR:—Model GYA-4203. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove the commutator cover band and shift the third brush mounting bracket by prying on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush mounting bracket is held in any desired position by friction between the mounting stud and the generator end plate. Maximum charging rate is 19 amperes (cold) reached at 1300 R.P.M. or 28 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	620	2	6.2	700
5	7.0	700	5	6.5	840
10	7.3	860	10	6.8	1100
14	7.7	1050	14	7.2	1600
16	7.9	1200			
19	8.0	1300			

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 3.8 amperes at 6.2 volts. Generator brush spring tension is 1¼-1½ pounds.

Mounting:—Generator is mounted on rear of timing chain case at right of engine. To remove generator, disconnect lead and remove two mounting studs extending through flange of timing chain case. Pull generator to rear and lift from place. The timing chain is adjusted by loosening the top generator mounting stud and taking up on the adjustment nut. The chain must be loose enough to run quietly. If the chain hums the adjustment nut must be backed off until the noise stops.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model CB-4007. Relay is mounted on top of the generator. Relay closes at 8 M.P.H. or 620 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens at 7 M.P.H. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING:—Clum Switch Model 10592. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side lamps are 6-8 volt, 3 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

MODEL 6-90 (1927)
AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION

BATTERY:—U.S.L. Type XY-15-X, 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 208 hours. The positive (+) terminal is grounded. Battery is mounted on the frame on the right side of the car.

IGNITION:—Coil Model IG-4035. Distributor Model IG-4137. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 12 amperes with engine running and 4.5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 20°. Maximum automatic advance is 10°. Breaker arm spring tension is 18-20 ounces.

Mounting:—Ignition coil is mounted on the generator at right of engine. Distributor is mounted on right side of engine. To remove distributor, disconnect breaker lead at coil and remove distributor head with high tension cables attached. Then loosen hold-down stud in advance arm and lift distributor from place.

Oiling:—Put 5 to 8 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Put one drop of oil on the breaker arm pivot pin. Every 5000 miles put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the flywheel mark 'IGN' is under the pointer in the flywheel housing hand hole with piston No. 1 entering power stroke and the spark control lever fully advanced. To set timing, fully advance spark control lever. Then crank engine until piston No. 1 enters power stroke. This is the upstroke with both valves closed. Continue to crank engine until the flywheel mark is under the pointer. If the breaker contacts are not separating, loosen the advance arm clamp screw and rotate the distributor housing until contacts begin to separate. Tighten the clamp screw.

Valve Timing:—INLET VALVES:—Head diameter, 1 13/16 inches; stem diameter, .370 inch; valve length, 6 1/4 inches, valve lift, 1 1/32 inch; spring pressure, 110-120 pounds; tappet clearance, .004 inch (hot). Inlet valves open at top dead center and close 50° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/16 inches; stem diameter, .370 inch; valve length, 6 1/4 inches, valve lift, 1 1/32 inch; spring pressure, 110-120 pounds; tappet clearance, .006 inch (hot). Exhaust valves open 50° before lower dead center and close at top dead center. Valve stem guides are removable. Over-size valve stems are not made. In setting camshaft, first set tappet clearance at .0075 inch.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MW-4101. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2-3 pounds each. Starter switch is Model SW-4105. Starter cranks the engine at 150 R.P.M. taking 140 amperes at 5.0 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.		5.5	
1.75 "	1690	5.25	150
3.2 "	1240	5.0	200
6.1 "	770	4.5	300
9.3 "	440	4.0	400
12.6 "	200	3.5	500
15.6 "	Lock	3.0	470

Mounting:—Starter is mounted at right of engine on forward side of flywheel housing by sleeve mounting. To remove starter, disconnect starter cable and remove pilot screw and mounting stud. Then slide starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side.

PEERLESS

MODEL 6-90 (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM
AUTO-LITE IGNITION

Continued from preceding page.

GENERATOR:—Model GRE-4201-6. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust charging rate, remove commutator cover band and shift third brush mounting bracket by prying on third brush mounting stud with a screw driver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any desired position by friction between the mounting stud and the generator end plate. Maximum charging rate is 18.5 amperes at 8 volts, reached at 1200 R.P.M. or 26 M.P.H., car speed in high gear.

Generator Data

18.....	7.85.....	1240	14.....	8.0.....	1360

Generator motoring draws 5.5 amperes at 6 volts. Shunt field current is 4-4.5 amperes at 6 volts. Brush spring tension is 1¼-1½ pounds each.

Mounting:—Generator is flange mounted at right of engine on special bracket at rear of timing chain case. To remove generator, disconnect lead and remove three generator flange mounting capscrews. Slide the generator to the rear. Drive is through a slotted steel coupling. Timing chain is adjusted by loosening generator bracket mounting screw and shifting the bracket. Loosen the mounting screws and pry the bracket away from the engine at the top where the mounting holes are slotted to provide for movement until the chain begins to hum. Then back up the bracket until the noise stops and tighten the screws. The chain must always be loose enough to run quietly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles. Ball bearings are used on each end of the generator.

RELAY:—Model CB-4007. Relay is mounted on top of the generator. Relay closes at 450-500 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens at 400 R.P.M. or 6 M.P.H. with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING:—Clum Switch Model 10592. Auto-Lite No. XA-315. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side lamps are 6-8 volt, 3 cp. S.C. Dash and tail lamps are each 6-8 volt, 21 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

PEERLESS
Model 8-69 (1927)
Delco-Remy System

Plate 1291

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

PEERLESS MODEL 8-69 (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-XX-19-1. Willard, Type XR-19, 6 volt. Starting capacity is 146 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The positive (+) terminal is grounded. Battery is mounted on the car frame at the right.

IGNITION:—Coil Model 2178. Distributor Model 5297. Breaker contacts separate .0225-.0275 inch. They are made of tungsten. Resurface contacts with a fine flat jewelers file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20°. Automatic advance begins at 600 R.P.M. and reaches a maximum of 23-27° at 2800 R.P.M. Breaker arm spring tension is 16-20 ounces. Breaker has two sets of contacts operating on a four-sided cam and opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation. The firing interval must be correctly set (see Timing).

Mounting:—Distributor is mounted at forward end of engine between the cylinder banks. To remove distributor, disconnect primary leads and remove distributor head with high tension cables intact. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 15° before top dead center (measured on the flywheel) with the spark control lever in the fully advanced position. To set timing, fully advance spark control lever. Crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until the mark on the flywheel is opposite the indicator on the flywheel case. This is 15° or approximately 5½ teeth on the flywheel before top dead center mark. The breaker contacts mounted on the stationary plate should begin to separate at this point. To set contacts, loosen the screw in the center of the breaker cam and rotate the cam until contacts begin to separate. Then tighten the screw. The second set of contacts mounted on the movable plate separate 45° after this point. They may be checked by special adjusting cam put out by distributor manufacturer. Remove regular cam and replace with adjustment cam. The fiber bumper of the breaker arm should rest in the notch on the cam. To adjust, loosen the lock screws in the mounting plate and turn eccentric adjusting screw until this position is reached. Then tighten the lock screws. With correct adjustment, the second set of breaker contacts begin to separate 10 13/16 teeth past the top dead center mark on the flywheel.

Valve Timing:—INLET VALVES:—Head diameter, 1¾ inches; stem diameter, .370-.372 inch; valve length, 6¾ inches; valve lift, ¾ inch; spring pressure, 125 pounds; tappet clearance, .0075 inch. Inlet valves open on top dead center and close 47° after lower dead center.

EXHAUST VALVES:—Head diameter, 1¾ inches; stem diameter, .370-.372 inch; valve length, 6¾ inches; valve lift, ¾ inch; spring pressure, 125 pounds; tappet clearance, .0075 inch. Exhaust opens 47° before lower dead center and closes at top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1R-1L-4R-4L-2L-3R-3L-2R.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 277. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2¼-2¾ pounds each. Starter switch is Model 1953.

Starter Data

Torque	R.P.M.	Volts	Amperes

PEERLESS
MODEL 8-69 (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is base mounted at right of engine. To remove starter, disconnect starter cable and remove four hold down screws in motor base. Then lift starter from place.

Oiling:—Starter uses three oilless bearings. They require no attention.

GENERATOR:—Model 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust charging rate, remove commutator cover band and shift third brush mounting plate by means of the handle provided. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any desired position by friction between the plate and the generator end plate. Maximum charging rate is 17 amperes (hot) reached at 1600 R.P.M. or 25 M.P.H.

Generator Data (Hot)

Amperes	R.P.M.
8	800
17	1600

Operating as a motor, generator draws 5 amperes at 6 volts. Shunt field current is 2.75 amperes at 6 volts. Generator brush spring tension is $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Mounting:—Generator is base mounted at front of engine on left side and is driven through a coupling from the cross shaft at the forward end of the engine. To remove generator, disconnect drive coupling and generator lead. Then remove hold down screws in generator base and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay is mounted on the generator. Relay closes when the voltage reaches 6.75-7.5 volts and opens with a discharge current of 0.3 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.020 inch. Air gap between relay armature and coil core is .025-.035 inch, contacts closed.

LIGHTING:—Delco Switch Model 1293. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Side lamps are 6-8 volt, 3 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch. A current of 25-30 amperes causes this to operate. While vibrating the current is 10-15 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

REO FLYING CLOUD MODEL A (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type SJRR-4, 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 636-K. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Manual advance is 25° (engine). Automatic advance begins at 1000 R.P.M. and reaches a maximum of 21° at 2800 R.P.M. of the engine. The ignition switch is Model 440-B.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on cylinder head and is driven by spiral gears from the camshaft. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with high tension cables intact. Then loosen distributor clamp screw and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one inch after top dead center (on the flywheel) with the spark lever and breaker assembly fully retarded. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Then remove inspection hole cover in top of flywheel case. The flywheel marking 'UDC' will be opposite the indicator line in the edge of the opening. Fully retard spark lever and crank engine over one inch when flywheel mark will be one inch past the indicator. Breaker contacts should separate at this point. If they do not, loosen advance clamp screw and rotate until contacts begin to separate. Tighten the clamp screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 724-E. Starter is connected to the engine through a mechanical pinion shift and an overrunning clutch. The direction of rotation of the armature shaft is clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is mounted at left of engine on rear of flywheel case by modified S.A.E. No. 1 flange mounting. To remove starter, remove floor boards of front compartment and disconnect starter cable. Then remove flange mounting cap screws and slide starter to rear.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Every six months or each 5000 miles, remove the grease plug in the gear case and repack the reduction gears with medium cup grease.

GENERATOR:—Model 949-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 160°F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator endplate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. The maximum charging rate is 21 amperes (cold) at 8.5 volts, reached at 1450 R.P.M.

21	8.5	1450	9-12	7.5	2000

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts, directly across field terminals. Brush spring tension is 24-28 ounces each.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove flange mounting cap screws. Then slide generator to the rear. Generator drive is by slotted tongue from chain sprocket. Adjustment of timing chain is provided by loosening the generator mounting screws and moving the generator sideways. The chain should be loose enough to run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Side lamps are 6-8 volt, 3 cp. S.C. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 3 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on block mounted on the dash is 20 amperes.

REO WOLVERINE SIX (1927) NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH EAST IGNITION

BATTERY:—Willard, Type RR-13, 6 volt, 90 ampere hour. Battery has 13 plates.

The negative (—) terminal is grounded.

IGNITION:—Coil Type 17232. Distributor Type 10820. Breaker contacts separate .020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20°. Automatic advance begins at 400 R.P.M. and reaches a maximum of 22½° at 2000 R.P.M. of the engine.

Mounting:—Distributor is mounted on top of the engine block and is driven by spiral gears and extension shaft from the camshaft. To remove distributor, remove manual advance rod and disconnect primary lead and distributor head with high tension cables intact. Then remove set screw in side of distributor mounting bracket and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles. At the same time remove the distributor rotor and saturate the felt oiler in the oil cup in the distributor shaft. Put a small amount of grease on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Then fully retard manual spark advance lever and remove cover from timing inspection hole on the top of the flywheel housing. Continue to crank engine until piston No. 1 reaches top dead center. At this point the flywheel mark 'UDC' will be opposite the mark on the flywheel housing. Breaker contacts should begin to separate. If they do not, loosen clamp screw in manual advance arm and rotate distributor in a clockwise direction until contacts begin to separate. Tighten the clamp screw. Check timing by rocking the distributor back and forth. The backlash of the gears should be sufficient to open and close contacts.

Valve Timing:—To check valve timing, set tappet clearance of inlet valve in cylinder No. 6 at .008 inch with pushrod on heel of cam. Then crank engine until piston in cylinder No. 6 is .0125 inch past upper dead center. The intake valve in cylinder No. 6 should open at this point. There is a plug in the cylinder head directly over No. 6 piston to aid in setting this position. After checking valve timing set all tappet clearances at .005 inch.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Type 6304. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Type 15380. Brush spring tension is 3 pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1600	5.3	160

17	8.0	1400	14.5	8	1600
16	8.0	1600	13.5	8	1800
13.3	8.0	2000	12.5	8	2000
11	8.0	2400	10.5	8	2400

Generator motoring draws 4 amperes at 6 volts. Shunt field current is 3.2 amperes at 6 volts. Brush spring tension is 12-16 ounces.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove two flange mounting cap screws. Then slide generator to the rear. Generator drive is by slotted tongue from chain sprocket. Adjustment of timing chain tension is made by loosening generator mounting screws and rotating generator outward around lower stud. The chain should be loose enough to insure quiet running.

Oiling:—Put 2 or 3 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Type 15850. Relay is mounted on top of the generator. Relay closes at 600 R.P.M. when the voltage of the generator reaches 6.75 volts and opens with a discharge current of 0.2 amperes. Charging current at closing of contacts is 1-2 amperes. Relay contacts separate .020-.025 inch. Air gap between relay armature and coil core is .030 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp double filament using second 21 cp filament instead of dimming. Side lamps are 6-8 volt, 3 cp SC. Dome lamp is 6-8 volt, 3 cp. SC. Stop lamp is 6-8 volt, 15 cp SC. Dash and tail lamps are each 6-8 volt, 3 cp SC.

FUSES:—Generator field fuse is 6 amperes. Lighting fuse on block is 20 amperes.

STANLEY STEAMER MODELS 252 (1925) 262 (1926-27) AMERICAN BOSCH GENERATING AND LIGHTING SYSTEM

BATTERY:—(1925) Prest-O-Lite, Type 611-SHK, 6 volt. (1926-27) Exide, Type 3-XC-13-1, 6 volt. The negative (—) terminal is grounded. Battery is mounted under the rear seat.

GENERATOR:—Model 1272. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, on early generators loosen the nut on generator end plate holding third brush mounting plate and shift third brush. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment. On later model generators shift the third brush by inserting a special Bosch key in the hole provided on the end plate and turning the key. The third brush may be shifted by hand if the key is not available by first removing the commutator band. The third brush mounting plate is held in any desired position by friction clamp washers. The maximum charging rate is 17-19 amperes reached at 1100-1300 R.P.M. or 30 M.P.H.

Generator Data

Cold Test			Hot Test

17	8.0	1200	13	8.0	1350
13	8.0	1950	11	7.8	2000

Running as a motor, generator draws 6 amperes at 6 volts. Shunt field current is 6.6 amperes at 6 volts. Generator brush spring tension is 1½-1¾ pounds each.

Mounting:—Generator is mounted in pump pit. To remove generator, disconnect lead and loosen mounting strap. Then lift generator from place. The relay is mounted on the dash.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay closes at 550-600 R.P.M. or 6-8 M.P.H. when the voltage of the generator reaches 6.5-7.5 volts and opens at 450-500 R.P.M. with a discharge current of 1-3 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.030 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Clum Switch Model 10073. Head lamps are 6-8 volt, 21 cp. S.C. Dimmer lamps are 6-8 volt, 4 cp. S.C. Dash and tail lamps are each 6-8 volt, 4 cp. Dome and stop lamps are each 6-8 volt, 4 cp.

FUSES:—Generator field fuse is 7.5 amperes. Lighting fuse on switch is 10 amperes.

STEARNS KNIGHT

MODEL F-6-85 (1927) AFTER DECEMBER 16, 1926 DE JON GENERATING, STARTING AND LIGHTING SYSTEM DE JON IGNITION

BATTERY:—U.S.L. Type 6-HVX-5X, 12 volt. Starting capacity is 96 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted in special compartment in splasher assembly on right side.

IGNITION:—Coil Model CA-4003. Distributor Model IA-4004. Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of the manual type. Breaker arm spring tension is 20 ounces. Ignition current is 4.75-5 amperes at 12 volts with ballast resistor cold decreasing to 2-2.1 amperes within 30 seconds.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on the left side of the engine. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head and rotor. Then remove set screw in base mounting flange and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Every month put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one inch after top dead center (measured on the flywheel) with the spark control lever in the fully retarded position. To check timing, crank engine until piston No. 1 reaches top dead center entering power stroke. Fully retard spark control lever and continue to crank engine over one inch measuring distance on flywheel by removing inspection hole cover. If breaker contacts do not separate at this point, loosen taper screw in center of breaker cam and rotate cam until contacts begin to separate. Tighten the screw. The cam is reversible and care must be taken to see that the arrow on top of the cam points in the direction of rotation (counter-clockwise).

Valve Timing:—Crank engine until piston No. 1 reaches top dead center. Then turn eccentric shaft until exhaust port in outer sleeve of cylinder No. 1 has just closed when the upper edge of the port will pass the lower edge of the cylinder port with the outer sleeve moving downward. Assemble the timing chain, being careful not to disturb the relative position of the crankshaft and eccentric shaft.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 S.A.E. Standard. Gaps are .028 inch.

STARTER:—Model SB-4003. Starter is connected to the engine through an inboard Bendix drive Type L-13-MX. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model SW-4001. Starter cranks the engine at 150 R.P.M. drawing 30 amperes at 12 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5	40
1 "	3400	11	100
3.6 "	2250	10	200
6.6 "	1700	9	300
10.2 "	1250	8	400
29.0 "	Lock	4	880

Mounting:—Starter is mounted at right of engine on forward side of the flywheel case. To remove starter, disconnect cable and remove three mounting bolts. Pull starter forward approximately 1/2 inch. Then pull starter toward car frame and forward until it is clear of flywheel housing.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model DC-4001. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust charging rate, insert a screwdriver in the slotted head of the third brush shifting shaft located on the generator endplate just above the bearing retainer and turn the shaft in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The maximum charging rate of 11 amperes (hot) is reached at 1600 R.P.M. or approximately 25 M.P.H.

Generator Data			
Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	500	0	600
4	600	5	800
8	800	8	1000
11	1000	11	1600
14	1600	9	2000
12	2000	7	2800

Generator motoring draws 4.5 amperes at 12 volts. Shunt field draws 1.6-1.8 amperes at 12 volts. Brush spring tension is $1\frac{1}{4}$ - $1\frac{1}{2}$ pounds each.

Mounting:—Generator is base mounted on right of engine. To remove generator, disconnect lead and remove two bolts from drive coupling. Then remove four base mounting screws and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model RA-4002. Relay is mounted on the generator. Relay closes at 500-575 R.P.M. when the generator voltage reaches 7-8 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts must not exceed 5 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. double filament using the second 21 cp. filament insted of dimming. A resistance is mounted inside the head lights to allow these lamps to be used on the 12 volt line. Auxiliary head lamps are 12-14 volt, 4 cp. S.C. Stop and backing lamps are 12-14 volt, 4 cp. S.C. Tail lamp is 12-14 volt, 4 cp. S.C. Dash, tonneau, dome and corner lamps are each 12-14 volt, 2 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes.

DE JON IGNITION

BATTERY:—U.S.L. Type 3-CVX-10X, 6 volt Starting capacity is 190 amperes for 20 minutes Lighting capacity is 5 amperes for 38 4 hours The positive (+) terminal is grounded Battery is mounted in a special compartment in right splasher assembly

IGNITION:—Coil Model CA-4023. Distributor Model IAA-4003. Breaker contacts separate 018-020 inch They are made of tungsten Resurface contacts with a fine flat contact file or on a medium hard oilstone Distributor is semi-automatic Manual advance is 20° (engine) Automatic advance begins at 400 RPM (engine) and reaches a maximum of 30° (engine) at 2800 RPM Total advance is 50° (engine) or 25° on distributor Breaker arm spring tension is 20 ounces Ignition current is 65 amperes at 6 volts with ballast resistor cold decreasing to 4-45 amperes as resistor becomes heated On bench test the maximum spark gap between needle points is 400 inch with primary voltage of 6 volts and distributor RPM between 600 and 1600 RPM

Mounting:—Ignition coil is mounted on the dash Distributor is mounted on left side of engine by standard SAE Type 'B' mounting To remove distributor, disconnect primary lead and manual advance rod and remove distributor head and rotor Then remove short bolt and nut in distributor arm and lift distributor from place

Oiling:—Put 4 or 5 drops of light engine oil on the side of the distributor housing every two weeks or each 500 miles Every month put a small amount of vaseline on the face of the breaker cam

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with spark control lever in the fully retarded position To set timing, crank engine until No 1 piston enters compression stroke This can be checked by removing spark plugs in other cylinders and cranking engine until compression is felt Fully retard spark control lever and continue to crank engine until piston reaches top dead center when the dead center mark on the flywheel will be opposite the indicator in the clutch inspection hole If breaker contacts are not separating loosen taper screw in center of cam and rotate cam until contacts begin to separate Tighten the screw

Valve Timing:—Crank engine until piston No 1 reaches top dead center Then turn eccentric shaft until exhaust port in cylinder No 1 has just closed when the upper edge of the port in the outer sleeve will just pass the lower edge of the cylinder port with the outer sleeve moving downward Then assemble timing chain, being careful not to disturb the relative position of the eccentric shaft and crankshaft

Firing Order:—The firing order is 1-5-3-6-2-4

Spark Plugs:—Spark plugs are 7/8 SAE Standard Gaps are 028 inch

STARTER:—Model SD-4101. Starter is connected to the engine through an inboard Bendix drive The direction of rotation is counter-clockwise, looking at the commutator end Starter switch is Model SW-4001 Brush spring tension is 2-3 pounds

Starter Data

Torque	RPM	Volts	Amperes
0 lb ft	Free	6	75
242 "	Lock	3	620

Mounting:—Stater is mounted at right of engine on forward side of flywheel case To remove starter, disconnect cable and remove three mounting bolts Then pull starter forward approximately 1/2 inch Pull starter toward car frame and forward until Bendix drive clears flywheel case and lift starter from place

Oiling:—Starter bearings are oilless They require no attention

GENERATOR:—Model DA-4016. The direction of rotation is counter-clockwise, looking at the commutator end Generator current regulation is by third brush shunt field To adjust charging rate, insert a screwdriver in the slotted end of the third brush shifting shaft on the commutator endplate and turn the shaft in a counter-clockwise direction to increase charging rate and in the opposite direction to decrease the charging rate With maximum setting generator output is 16 amperes at 6 volts On the car the maximum charging rate of 11 amperes (hot) is reached at 1200 RPM or approximately 25 MPH

DE JON GENERATING, STARTING AND LIGHTING SYSTEM
DE JON IGNITION

Continued from preceding page.

Generator Data			
Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
0	480	0	500
1	500	2	600
5.5	600	7	800
11	800	10	1000
15	1200	11	1200
12	2400	9	2400
10	3200	7	3200

Generator motoring draws 4.5 amperes at 6 volts. Shunt field current is 2.5 amperes at 6 volts. Brush spring tension is $1\frac{1}{2}$ -2 pounds. A five ampere field fuse is mounted on the endplate.

Mounting:—Generator is base mounted at right of engine. To remove generator, disconnect lead and remove two bolts from drive coupling. Then remove four base mounting screws and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oilers every two weeks or each 500 miles.

RELAY:—Model RA-4001-A. Relay is mounted on the generator. Relay closes at 480-500 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current must not exceed 2 amperes at closing of contacts. Relay contacts separate .025-.035 inch. Air gap is .010 inch, contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Auxiliary head lamps are 6-8 volt, 3 cp. S.C. Backing and stop lamps are 6-8 volt, 15 cp. S.C. Dash, tail, dome and corner lamps are each 6-8 volt, 3 cp. S.C.

Switches:—Lighting switch is mounted at base of steering column and is controlled by lever on steering wheel. A dimmer switch is located on the side of the steering column.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes.

Plate 1297

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

STEARNS KNIGHT MODEL G-8-85 (1927). EIGHT CYLINDER MODEL DE JON GENERATING, STARTING AND LIGHTING SYSTEM DE JON IGNITION

BATTERY:—U.S.L. Type 3-CVX-10X, 6 volt. Starting capacity is 192 amperes for 20 minutes. Lighting capacity is 5 amperes for 38.4 hours. The negative (—) terminal is grounded. Battery is mounted in a special compartment in right splasher assembly.

IGNITION:—Coil Model CA-4023. Distributor Model IAA-4002. Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30° (engine). Automatic advance begins at 400 R.P.M. Total advance is 50° (engine) or 25° on distributor. Breaker arm spring tension is 20 ounces. Ignition current is 6.5 amperes at 6 volts with ballast resistor cold decreasing to 4.45 amperes as resistor becomes heated. On bench test the maximum spark gap between needle points is .400 inch with primary voltage of 6 volts and distributor running between 600 and 1600 R.P.M.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on left side of engine by standard S.A.E. Type 'B' mounting. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head and rotor. Then remove short bolt and nut in distributor arm and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Every month put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with spark control lever in the fully retarded position. To set timing, crank engine until No. 1 piston enters compression stroke. This can be checked by removing spark plugs in other cylinders and cranking engine until compression is felt. Fully retard spark control lever and continue to crank engine until piston reaches top dead center when the dead center mark on the flywheel will be opposite the indicator in the clutch inspection hole. If breaker contacts are not separating, loosen taper screw in center of cam and rotate cam until contacts begin to separate. Tighten the screw.

Valve Timing:—Crank engine until piston No. 1 reaches top dead center. Then turn eccentric shaft until exhaust port in cylinder No. 1 has just closed when the top of the port in the outer sleeve has closed over lower edge of cylinder port. Then assemble the front timing chain (the short one). With chain in place crank engine over until crankshaft reaches a position $4\frac{3}{4}$ inches past lower dead center (measured on the outside diameter of the flywheel). Then set inner sleeve so that lower edge of exhaust port has just closed on junk rings.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ S.A.E. Standard. Gaps are .028 inch.

STARTER:—Model SD-4102. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Switch is Model 4001. Brush spring tension is 2-3 pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	75
24.4 "	Lock	3	620

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel case. To remove starter, first remove toeboard and remove black enameled cap at rear of flywheel housing in transmission case flange. This exposes Bendix drive. Remove Bendix drive. Then remove set screw in flywheel case directly above starter sleeve and disconnect starter cable. Pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

De Jon System

Plate 1297A

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

STUTZ MODEL AA (1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 617-SHK, 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The negative (—) terminal is grounded. Battery is mounted under the left front seat.

IGNITION:—Coil Model 2195. Distributor Model 4022. Breaker contacts separate .015-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance begins at 450 R.P.M. of the crankshaft. Maximum automatic advance is 20° at 2400 R.P.M. of the crankshaft. Breaker arm spring tension is 16-20 ounces. Breaker has two sets of contacts. They must be synchronized for correct ignition (see Timing).

Mounting:—Ignition coil is mounted on hood ledge at right of engine. Distributor is mounted on right of engine at forward end. To remove distributor, disconnect manual advance rod and breaker lead. Remove distributor head with high tension cables intact. Then remove two cap screws in distributor base mounting and lift distributor from place.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the side of the distributor housing every 750 miles. Put a small bit of vaseline on the face of the breaker cam every month.

Timing:—Check synchronization of contacts before setting timing. Breaker has two sets of contacts on an eight sided cam. Both sets of contacts must open at the same instant. Crank engine over slowly and watch dash ammeter. Ammeter should indicate 4 amperes discharge with contacts closed decreasing to '0' as contacts open. If ammeter drops to '0' in two stages indicating 2 amperes discharge after dropping from 4 amperes and then indicating '0' the contacts must be synchronized. Use special dial which is Stutz part No. 21309 or connect six volt lamp in each primary line. Set contact opening at .017 inch with contact arm on lobe of cam. This is important. Then loosen four screws on breaker mounting plate. Shift the plate backward to make the front contacts (nearest engine) open earlier and forward toward front of car to make rear contacts (furthest from engine) open earlier. Tighten the four screws. With correct setting the two lamps in primary circuit will go out at the same instant.

Breaker contacts separate when the piston entering power stroke reaches top dead center with the manual spark lever advanced approximately 7/10 or between the 'eight' and 'nine o'clock' positions on the steering wheel. To check timing, crank engine until piston No. 1 reaches top dead center on compression stroke. At this point the flywheel mark 'Top C1 & 8' will be opposite the indicator in the inspection hole on the top of the flywheel case. Then advance spark control lever 7/10 of timing range. If the breaker contacts do not separate at this point, remove rotor and loosen screw in center of breaker cam. Rotate cam until contacts begin to separate. Tighten the screw and check the synchronization of contacts by watching dash ammeter as contacts open.

Valve Timing:—INLET VALVES:—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; stem length, 6 11/32 inches (over all); valve lift, 11/32 inch; spring pressure, 40 pounds valve closed and 90 pounds valve open; tappet clearance, .028 inch. Inlet valves open 10° or 1 7/64 inches on flywheel past top dead center and close 50° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; stem length, 6 11/32 inches (over all); valve lift, 11/32 inch; spring pressure, 40 pounds valve closed and 90 pounds valve open; tappet clearance, .028 inch. Exhaust valves open 46° before lower dead center and close 10° past top dead center. Valve stem guides are removable. Oversize valve stems are not made. Inlet opening and exhaust closing of cylinder No. 1 is marked on flywheel by mark 'IN OPEN'. This is 10° or 1 7/64 inches on the flywheel past the top dead center mark for cylinder No. 1 which is 'Top C1 & 8'.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side

STUTZ
MODEL AA (1927)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 363. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the screw on the generator end plate and shift the third brush by sliding the screw in the slot. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the nut after making the adjustment. The maximum charging rate of 16-18 amperes is reached at 1600 R.P.M. or 25 M.P.H.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.
7	1050		
16-18	1600	12	1500

Mounting:—Generator is mounted by special flange on right of engine at rear of timing chain case. To remove generator, disconnect water pump drive coupling and remove three flange mounting cap screws. Then slide generator to rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every 750 miles

RELAY:—Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2 amperes. Relay contacts separate .025 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Delco Switch Model 1283. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Auxiliary head lamps are 6-8 volt, 4 cp. S.C. Stop, backing and inspection lamps are each 6-8 volt, 21 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C. Quarter lamps are 6-8 volt, 21 cp. D.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the switch. It begins to operate when the current reaches 25-30 amperes and continues with 10-15 amperes.

To set valve timing crank engine until flywheel mark 'Top C 1 & 8' is opposite indicator in inspection hole on flywheel case. Then turn camshaft until heel of cam is over No. 2 valve (the inlet valve of cylinder No. 1). Set valve with clearance of .032 inch. This is very important. Then insert .004 feeler between cam and valve cap and turn camshaft in a clockwise direction (viewed from front) until feeler is just gripped by cam. This is proper position for camshaft. Then mesh camshaft sprocket in chain and turn until all play is taken up on right or carburetor side of chain. Then slip chain on transfer sprocket one tooth at a time until holes in camshaft sprocket and camshaft line up. Put in four capscrews mounting sprocket on camshaft. The spring tension of the automatic adjusting sprocket must then be set. Mesh adjusting sprocket in chain and insert eccentric hub. Turn hub clockwise until all slack is taken up in chain. Then wind spiral spring one and one-half turns and insert end in nearest slot of stationary stud. Reassemble plain washer and insert cotter. The clearance between the cam and valve cap of all the valves should be set at .028 inch.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. metric. Gaps are .025 inch.

STARTER:—Model 334. Starter is connected to the engine through an overrunning clutch and a manual pinion shift interconnected with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 2¼-2½ pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	4	60
11.5 "	Lock	2.75	500

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starting pedal rod and pedal return spring. Then remove three flange mounting cap screws and slide starter forward. Lift starter from place.

STUTZ

Model AA (1927)

Delco-Remy System

Plate 1298A

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

STUTZ MODEL AA (LATE 1927) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 617-SHK. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The negative (—) terminal is grounded. Battery is mounted under the left front seat.

IGNITION:—Coil Model 525-C (Two). Distributor Model 402-B. Breaker contacts separate .015-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance begins at 450 R.P.M. of the crankshaft. Maximum automatic advance is 20° at 2400 R.P.M. of the crankshaft. Breaker arm spring tension is 16-20 ounces. Breaker uses two sets of contacts on an eight sided cam. They must be synchronized for proper ignition (see Timing).

Mounting:—Ignition coils are mounted on hood ledge at right of engine. Distributor is mounted on right of engine at forward end. To remove distributor, disconnect primary leads and manual advance rod. Remove distributor head with high tension cables intact. Then remove two cap screws in distributor base mounting and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every 750 miles. Put a small bit of vaseline on the face of the breaker cam every month.

Timing:—Check synchronization of contacts before setting timing. Breaker has two sets of contacts on an eight sided cam. Both sets of contacts must open at the same instant. Crank engine over slowly and watch dash ammeter. Ammeter should indicate 4 amperes discharge with contacts closed, decreasing to '0' as the contacts open. If the ammeter needle drops in two stages indicating 2 amperes discharge and then '0' the contacts are not opening together and must be synchronized. Use special dial which is Stutz part No. 21309 or connect six volt lamp in each primary line. Set contact opening at .017 inch with contact arm on lobe of cam. This is very important. Then loosen four mounting screws on mounting plate and shift plate toward front of car to make front contacts (nearest engine) open earlier and toward rear of car to make rear contacts (furthest from engine) open earlier. Tighten the four screws. With correct synchronization the two lamps will go out at the same instant as the contacts open.

Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever advanced approximately 7/10 or in a position between the 'eight' and the 'nine o'clock' position on the steering wheel. To check timing, crank engine until piston No. 1 reaches top dead center on compression stroke. At this point the flywheel mark 'Top C 1 & 8' will be opposite the indicator in the inspection hole in the flywheel case. Then advance spark control lever 7/10 of timing range. If breaker contacts do not separate at this point, remove rotor and loosen screw in center of breaker cam. Rotate cam until contacts begin to separate. Tighten the screw and check synchronization of contacts by watching dash ammeter as contacts open.

Valve Timing:—INLET VALVES:—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; stem length, 6 11/32 inches (over all); valve lift, 11/32 inch; spring pressure, 56 pounds valve closed and 102 pounds valve opened; tappet clearance, .028 inch. Inlet valves open 10° or 1 7/64 inches after top dead center and close 50° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; stem length, 6 11/32 inches (over all); valve lift, 11/32 inch; spring pressure, 56 pounds valve closed and 102 pounds valve open; tappet clearance, .028 inch. Exhaust valves open 46° before lower dead center and close 10° after top dead center. Valve stem guides are removable. Oversize valve stems are not made. Inlet opening and exhaust closing of cylinder No. 1 is marked on flywheel by mark 'IN OPEN'. This is 10° or 1 7/64 inches past the top dead center mark 'Top C 1 & 8'.

To set timing, crank engine until flywheel mark 'Top C 1 & 8' is opposite indicator in inspection hole in flywheel case. Then turn camshaft until heel of cam is over No. 2 valve which is the inlet valve of cylinder No. 1. Set backlash or clearance at .032 inch. This is very important. Then insert .004 feeler between cam and valve cap and turn camshaft in a clockwise direction (viewed from the

Continued on reverse side

STUTZ **MODEL AA (LATE 1927)** **DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM** **DELCO-REMY IGNITION**

Continued from preceding page.

front) until all play is taken up and the cam just grips the feeler. This is the proper position for the camshaft. Then mesh camshaft sprocket in chain and turn until all play is taken up in right or carburetor side of chain. Then slip chain on transfer sprocket one tooth at a time until camshaft sprocket holes line up with holes in camshaft flange so that capscrews can be inserted without disturbing relative positions of camshaft and crankshaft. Put in the four capscrews mounting sprocket on camshaft. The automatic adjusting sprocket must then be assembled. Mesh adjusting sprocket in chain and insert eccentric hub. Turn hub clockwise until all play is taken up in chain. Then wind spiral spring up one and one half turns and insert end in nearest slot of stationary hub. Put on plain washer and insert cotter. The clearance between the cam and the valve cap on all valves should be set at .028 inch with the camshaft turned so that the heel of the cam is over the valve cap.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. metric. Gaps are .025 inch.

STARTER:—Model 726-C. Starter is connected to the engine through a disc clutch and a manually operated pinion shift interconnected with the starting switch. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted on left of engine at forward side of flywheel housing. To remove starter, disconnect starter pedal rod and starter cable. Then remove three flange mounting cap screws and slide starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 949-H. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator endplate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the nut after making the adjustment. The maximum charging rate is 21 amperes (cold) reached at 1450 R.P.M.

Generator Data

Cold Test		Hot Test	
Amperes	Volts	Amperes	Volts
21	8.5	9-12	7.6
	1450		2000

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted by special flange on right of engine at rear of timing chain case. To remove generator, disconnect water pump drive coupling and three flange mounting cap screws. Then slide generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every 750 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1308. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Auxiliary head lamps are 6-8 volt, 4 cp. S.C. Stop, backing and inspection lamps are each 6-8 volt, 21 cp. S.C. Dash and tail lamps are each 6-8 volt, 2 cp. S.C. Quarter lamps are 6-8 volt, 21 cp. D.C. Front compartment lamps are 6-8 volt, 3 cp. D.C.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the ignition switch. A current of 25-30 amperes causes this device to operate limiting the current to 10-15 amperes.

STUTZ

Model AA (Late 1927)

Delco-Remy System

Plate 1299A

WILLS SAINTE CLAIRE
MODEL W-6 (1926) T-6 (1927)
DELCO-REMY GENERATING AND LIGHTING SYSTEM
AMERICAN BOSCH STARTER
DELCO-REMY IGNITION

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

BATTERY:—Willard, Type SJR-5, 6 volt. The starting capacity is 145 amperes for 20 minutes. The lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model No. 2177. Distributor Model No. 5280. Breaker contacts separate .020 to .025 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. No manual advance is provided. Automatic advance begins at 250 R.P.M. and reaches a maximum of 53°-57° at 900 R.P.M. The tension of the breaker arm spring should be 16-20 ounces.

Mounting:—Distributor is mounted at right of engine. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles if the car is driven more than 500 miles in two weeks. Place a small bit of medium heavy grease or vaseline on the face of the breaker cam and on the rotor track in the distributor head every 1000 miles. Polish the distributor head and remove all excess grease with a soft clean cloth.

Timing:—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position of 7° before top dead center (measured on the flywheel). In this position the mark 'T/SP' on the flywheel will be opposite the mark on the the flywheel housing. To set timing, loosen screw in center of breaker cam and rotate cam until the contacts begin to separate. Then tighten the screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are metric standard. Gaps are .025 inch.

STARTER:—A.B. Model No. 974. Starter is connected to the engine through a manually operated pinion shift. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2-2 1/4 pounds each.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2000	6	60
22 "	Lock	3.5	500

Mounting:—Starter is mounted at left of engine by special sleeve mounting. To remove starter, disconnect cable and remove pilot mounting screw from the starter sleeve. Then slide starter from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 335 (1926) Model 357 (1927). The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. The Model 357 generator is of split field type with third brush shunt field wound on one field pole. A straight shunt field is wound on the other field pole. This has a thermostat in series. Thermostat contacts open at 175°F. opening the field circuit and allowing the generator to operate as a third brush machine with reduced output. To adjust charging rate, remove commutator cover band and shift third brush. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Third brush is held in position by friction clamp washers. On the Model 357 it will be necessary to loosen the clamp bolt nut before the third brush can be shifted.

WILLS SAINTE CLAIRE
MODEL W-6 (1926) T-6 (1927)
DELCO-REMY GENERATING AND LIGHTING SYSTEM
AMERICAN BOSCH STARTER
DELCO-REMY IGNITION

Continued from preceding page.

Straight shunt field current on Model 357 generator is .6 amperes at 6 volts. Third brush shunt field current is 3.25 amperes at 6 volts. Brush spring tension is $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Mounting:—Generator Model 357 is flange mounted at rear of engine and is driven through transmission gears. To remove generator, first remove floor boards and disconnect generator lead. Then remove two mounting screws and lift generator from place. Generator Model 335 is cradle mounted.

Oiling:—Put 8 or 10 drops of light engine oil in the generator every two weeks or each 500 miles.

RELAY:—Model 5766. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010 inch with contacts closed.

LIGHTING:—Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Dash, tail, dome and quarter lamps are each 6-8 volt, 3 cp. S.C.

Switches:—Lighting switch is Model 1297. Dimmer switch is Model 1286. The dimmer switch is mounted on the steering column.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the lighting switch. This operates when the current reaches 25-30 amperes limiting the current to 10-15 amperes.

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

WILLYS KNIGHT MODEL 70-A (1927) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-7X, 6 volt. Starting capacity is 148.5 amperes for 20 minutes. Lighting capacity is 5 amperes for 28.4 hours. The negative (—) terminal is grounded. Battery is mounted on frame under front floor board on left hand side.

IGNITION:—Coil Model IG-4065. Distributor Model IGA-4021. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20° (engine). Automatic advance begins at 800 R.P.M. (engine). Maximum automatic advance is 20° (engine) reached at 2400 R.P.M. Breaker arm spring tension is 20 ounces. Ignition current is 1-3 amperes with engine running and 4-5 amperes with engine stopped.

Mounting:—Distributor is mounted on the right of the engine near the forward end. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables attached. Then remove two mounting screws and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn each week or each 250 miles. Every 5000 miles remove the rotor button and saturate the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .026 inch before top dead center with the manual advance lever in the fully advanced position. To check timing, crank engine until piston No. 1 enters compression stroke. This may be checked by removing spark plugs in the other cylinders and cranking engine until compression is felt. Then fully advance manual spark lever and continue to crank engine until ignition mark on the flywheel is opposite the indicator in the clutch inspection hole. This mark is 8° or 51/64 inch before top dead center. At this point the piston will be .026 inch before top dead center and the contacts should separate. To set timing, loosen the clamp screw under the distributor cup and rotate the distributor until contacts begin to separate. Tighten the clamp screw. A variation of 1° or 1/8 inch is allowable in setting the ignition.

Valve Timing:—The Willys Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold opposite No. 6 cylinder and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Then remove clutch inspection plate and crank engine until flywheel mark 'EC' is opposite the pointer on the flywheel case. Place electric lamp over spark plug port in cylinder No. 6 and rotate eccentric shaft in a clockwise direction until the upper edge of the port in the outside port passes the lower edge of the port in the cylinder block on the downward stroke. At this point the ray of lamp from the lamp will be cut off. Then assemble chain on crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in chain and change mesh of sprocket in chain one tooth at a time until the five cap screws can be inserted without changing the position of the eccentric shaft or crankshaft. Then tighten the five cap screws holding the sprocket rigidly on the shaft. To set tension of timing chain, turn idler eccentric bushing spring until all slackness is removed from chain. Then give spring one complete turn and insert end in slot of idler stud.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

STARTER:—Model MAB-4002. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 250 amperes at 5 volts. Starter switch is Model SW-4001. Brush spring tension is 13/4-2 1/4 pounds each.

WILLYS KNIGHT

MODEL 70-A (1927)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM

AUTO-LITE IGNITION

Continued from preceding page.

Starter Data			
Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24 "	Lock	4	725

Mounting:—Starter is barrel mounted at the right of the transmission case on the rear of the flywheel housing. To remove, disconnect cable and remove pilot mounting screw directly above starter sleeve. Then slide starter to rear and lift from place.

Oiling:—Put 7 or 8 drops of light engine oil in the oiler on the drive end of the starter every two weeks or each 500 miles.

GENERATOR:—Model GYA-4202A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush mounting bracket is held in any desired position by friction between the mounting stud and the end plate. Charging rate with maximum setting of third brush is 19 amperes at 8 volts.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	620	2	7.0	700
5	7	700	5	7.5	840
10	7.3	860	10	8.0	1100
14	7.7	1050	14	8.5	1600
16	7.9	1200			

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 3.8 amperes at 6.2 volts. Brush spring tension is 1 1/4-2 pounds.

Mounting:—Generator is cradle mounted on the right side of the engine. To remove generator, disconnect lead and loosen two nuts on mounting strap. Then disengage coupling and lift generator from place.

Oiling:—Put 7 or 8 drops of light engine oil in each of the generator oilers every week or each 250 miles.

RELAY:—Model CB-4007. Relay is mounted on the generator. Relay contacts close at approximately 620 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts must not exceed 2 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Briggs & Stratton 70-A. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 21 cp. S.C. Dash, tail and side lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

MODEL 8-70 (1927-28)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L. Type 3-HVX-7X, 6 volt. Starting capacity is 148 amperes for 20 minutes. Lighting capacity is 5 amperes for 28 hours. The negative (—) terminal is grounded. Battery is mounted on the left side of the car at the rear.

IGNITION:—Coil Model 525-C. Distributor Model 658-F. Breaker contacts separate .018-.024 inch. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 15° (engine). Maximum automatic advance is 18°. Breaker arm spring tension is 17-20 ounces. Breaker has two sets of contacts on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This is the correct firing interval for the Locomobile engine and must be accurately set (see Timing). Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped.

Mounting:—Distributor is mounted on the rear of the generator. To remove distributor, disconnect manual advance rod and breaker lead and remove head with cables attached. Then remove distributor clamp screw and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Every 5000 miles remove the rotor and saturate the wick oiler in the center of the shaft with light engine oil. Put a small bit of heavy grease on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts separate when the piston entering power stroke reaches top dead center with the manual spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Make certain that the spark lever is in the fully retarded position. Loosen the advance arm clamp screw and rotate the distributor housing until the contacts mounted on stationary plate begin to separate. Tighten the clamp screw. The other set of breaker contacts separate 45° after this point. To check firing interval, use Delco-Remy Part No. 820738. Place synchronizing tool on shaft after rotor has been removed. Clamp in place with slide pushed in so that visible arrow points in direction of rotation. Note scale reading on leading scale when first set of contacts separate. Then turn distributor shaft until same figure on second scale is opposite the same point on the distributor housing. If the second set of breaker contacts are not separating, loosen the lock screws on mounting plate and turn eccentric adjusting screw until contacts open. Check contact opening with contact arm on lobe of cam. If it is not within limits of .018-.024 inch, the contact gap must be reset and the synchronizing operation repeated.

Valve Timing:—INLET VALVES:—Head diameter, 1 1/2 inches; stem diameter, .309 inch; stem length, 6 1/32 inches; valve lift, 5/16 inch; spring pressure, 87 pounds; tappet clearance, .004 inch. Inlet valves open 8° past top dead center and close 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/8 inches; stem diameter, .309 inch; stem length, 6 1/32 inches; valve lift, 5/16 inch; spring pressure, 87 pounds; tappet clearance, .006 inch. Exhaust valves open 40° before lower dead center and close 8° past top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .026 inch.

STARTER:—Mode 716-B. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces each. Starter cranks the engine at 192 R.P.M. taking 128 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes

MODEL 8-70 (1927-28)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is mounted on left of engine. To remove starter, disconnect cable and remove three mounting bolts. Then lift starter from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter oiler every month or each 1000 miles.

GENERATOR:—Model 944-E. The direction of rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush system combined with a thermostat. Thermostat contacts open at 165°F. cutting a resistance in the shunt field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator endplate and remove the commutator cover band. Then move the third brush by hand in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 19 amperes (cold) reached at 1300 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19	8.5	1300	9-12	7.35-7.65	1300

Shunt field current is 5 amperes with 6 volts directly across field terminals. Motoring freely generator draws 5 amperes at 6 volts. Brush spring tension is 14-18 ounces each.

Mounting:—Generator is mounted at right of engine. To remove generator, disconnect generator lead and remove three flange mounting bolts. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Contacts separate .015-.025 inch. Air gap is .014-.018 inch, contacts closed.

LIGHTING:—Clum Lighting Switch. Head lamps are 6-8 volt, 21 cp. S.C. Stop lamp is 6-8 volt, 21 cp. S.C. Auxiliary head lamps are 6-8 volt, 2 cp. S.C. Dash, tail and dome lamps are each 6-8 volt, 2 cp. S.C.

FUSES:—Lighting fuses are 20 amperes.

LOCOMOBILE **MODEL 8-80 (1927) SERIAL NOS. 101 UP** **DE JON GENERATING, STARTING AND LIGHTING SYSTEM** **DE JON IGNITION**

SERVICE ENGINEERING COMPANY, SAN FRANCISCO—COPYRIGHTED, 1927

BATTERY:—U.S.L. Type 3-HVX-7X, 6 volt. Starting capacity is 148 amperes for 20 minutes. Lighting capacity is 5 amperes for 28 hours. The negative (—) terminal is grounded. Battery is mounted on the right side of the car amidships.

IGNITION:—Coil Model CA-4021. Distributor Model 1AA-4001. Breaker contacts gap should be set at .018-.020 inch. Resurface contacts when necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 20° (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 16° at 2300 R.P.M. Breaker arm spring tension is 20 ounces. Ignition current is 6.3-6.5 amperes at 6 volts when ignition is turned on, reducing to 3.5-3.6 amperes with ballast resistance heated. Condenser capacity is .20-.25 microfarads. On bench test maximum spark between needle points at atmospheric pressure is .394 inch with breaker R.P.M. of 1000.

Mounting:—Distributor is mounted on top of the cylinder block. To remove, disconnect manual advance rod and primary lead and remove head with cables attached. Then remove set screw on side of shaft housing and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every week or each 250 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark control lever in a fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Make certain that the spark lever is in the fully retarded position. Then loosen taper screw in center of the breaker cam and rotate cam until contacts begin to separate. Tighten the screw. Make certain that the arrow on the cam points in the direction of rotation.

Valve Timing:—INLET VALVES:—Head diameter, 1 25/32 inches; stem diameter, .3425 inch; stem length, 5 1/2 inches; valve lift, .356 inch; spring pressure, 91-95 pounds; tappet clearance, .010 inch. Inlet valves open at top dead center and close 45° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 25/32 inches; stem diameter, .3425 inch; stem length, 5 1/2 inches; valve lift, .356 inch; spring pressure, 91-95 pounds; tappet clearance, .010 inch. Exhaust valves open 50° before lower dead center and close 10° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .015-.018 inch.

STARTER:—Model SA-4013. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model SW-4001. Brush spring tension is 2-3 pounds each. Starter cranks the engine at 138 R.P.M. taking 175 amperes at 5.05 volts.

Starter Data

DE JON GENERATING, STARTING AND LIGHTING SYSTEM

DE JON IGNITION

Continued from preceding page.

GENERATOR:—Model DAA-4002. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust the generator output, turn the slotted head of the third brush shifting shaft which extends through the commutator endplate. Turning the shaft in a counter-clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Maximum charging rate is 15 amperes reached at 1200 R.P.M.

Generator Data		
Amperes	Volts	R.P.M.
2	6.4	625
10.9	6.7	800
14	7.0	1000
15	7.0	1200
14.9	7.0	1400
13.2	6.9	2000

Running freely as a motor generator draws 4 amperes at 6 volts. Shunt field current is 2.5 amperes at 6 volts. Brush spring tension is 1½-2 pounds each.

Mounting:—Generator is mounted on right of engine. To remove generator, disconnect lead and remove four mounting bolts. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model RA-4001-A. Relay is mounted on the generator. Relay contacts close when the voltage of the generator reaches 7-7.5- volts at approximately 600 R.P.M. and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 2 amperes. Contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Switch Model 10653. Head lamps are 6-8 volt, 21 cp S.C. Auxiliary head lamps are 6-8 volt, 3 cp. S.C. Stop and backing lamps are 6-8 volt, 21 cp S.C. Side, dash, tail and dome lamps are each 6-8 volt, 3 cp S.C.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

BATTERY:—Prest-O-Lite, Type A-617-SH, 6 volt. Starting capacity is 170 amperes for 20 minutes. Lighting capacity is 5 amperes for 32 hours. The positive (+) terminal is grounded. Battery is mounted in special compartment built in right front fender.

IGNITION:—Coil Model 552-A. Distributor Model 4030. Breaker contacts separate 0.0225-0.0275 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 40° (flywheel). Automatic advance begins at 700 R.P.M. (engine) and reaches a maximum of 20° (flywheel) at 2200 R.P.M. of the crankshaft. The breaker has two sets of contacts mounted at an angle of 45° operating on a four sided cam and opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This firing interval must be accurately set (see Timing). Breaker arm spring tension is 16-20 ounces.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance control rod. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oilers on the side of the distributor housing every two weeks or each 500 miles. Place a small bit of heavy grease on the face of the breaker cam every month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $1\frac{5}{8}$ inches (on the flywheel) before top dead center with the spark control lever in the fully advanced position. With piston No. 1 in this position the flywheel mark 'UDC- Cyl. 1 & 8' will be $1\frac{5}{8}$ inches before the indicator on the flywheel housing. To set timing, crank engine until piston No. 1 reaches firing position. Make certain that the spark control lever is fully advanced. If breaker contacts are not beginning to separate, loosen manual advance arm clamp screw and rotate distributor until contacts mounted on stationary plate begin to separate. Tighten the clamp screw. Check the second set of contacts with Delco-Remy Part No. 822572. This is a special gauge which fits on the shaft in place of the regular firing cam. Turn gauge so that bumper of stationary set of contacts fits in notch. If bumper of second set of contacts does not rest in notch, loosen two lockscrews on mounting plate and shift plate until proper setting is reached. Tighten the lockscrews.

Firing Order:—The firing order is 1-3-2-5-8-6-7-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are $\frac{1}{32}$ inch.

STARTER:—Model DM. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is a six pole two brush machine with one field coil which is so constructed that it winds around three sides of each pole alternately so each pole is surrounded by a 'U' shaped section of the coil.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb ft	5000	6	50
35 "	Lock	3.5	650

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing by sleeve mounting. To remove starter, disconnect starter cable and remove large pilot mounting screw. Then slide starter forward and lift from place.

Oiling:—Starter bearings are fitted with oilless bushings. They require no attention.

GENERATOR:—Model CG-678. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field with special compensating field. The generator has two shunt fields. A light shunt field is connected between the negative main brush and the third brush across which the battery is connected. The heavy shunt field is connected between the third brush and the positive main brush. The maximum charging rate is 16 amperes reached at 800-900 R.P.M.

Continued on reverse side

PACKARD

MODELS 3-36, 3-43 (1927-28)

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Generator Data		
Amperes	Volts	R.P.M.
0	6.2	385-400
9	6.8	550-600
16	7.4	800-900
8	7.0	2500

The light shunt field draws 2 amperes at 6 volts. The heavy shunt field draws 75 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. To adjust generator output, loosen the screw in the center of the knurled nut on the generator endplate and turn the nut in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run in this condition. Two brushes must be raised. If it is necessary to run the car with the battery disconnected, remove the relay cover and bridge the two screws which hold the relay to the generator frame with a short wire. If the generator cuts in late and does not generate more than 7 amperes at peak, the armature is shorted or the light shunt field is open. If the generator cuts in late and the output continues to increase at speeds over 2000 R.P.M. the heavy shunt field is open. If the output exceeds 11 amperes at 3000 R.P.M. but does not exceed the peak output, the heavy shunt field is shorted. The drive end bearing is in the engine and the generator must not be run on the test bench until a special bearing is bolted on. This is Owen-Dyneto Part No. 22196.

Mounting:—Generator is flange mounted at the right of the engine on the rear of the timing chain case. To remove generator, remove three flange mounting screws and pry generator to the rear, using a screwdriver to separate generator from bronze plate. The bronze plate must be left in the engine or the timing chain will be disturbed, making it necessary to retune the valves.

Oiling:—The drive end bearing is oiled by splash from the chain case. Put 4 or 5 drops of light engine oil in the commutator end oiler every month or each 1000 miles.

RELAY:—Relay is mounted on top of the generator. Relay closes at 385-400 R.P.M. when the generator voltage reaches 6.2 volts and opens with a discharge current of 0-2 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1317. Lighting switch is mounted at base of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Auxiliary lamps (in head lamps) are 6-8 volt, 3 cp. D.C. Dome lamp is 6-8 volt, 3 cp. S.C. Dash, tail and tonneau lamps are each 6-8 volt, 3 cp. S.C. Stop and backing lamps are each 6-8 volt, 21 cp. S.C.

CIRCUIT BREAKER:—Model 5773. A vibrating circuit breaker is mounted on the dash. It cuts in at 20-30 amperes and operates with 12-15 amperes flow across a dead short circuit. Circuit breaker contacts separate .010-.030 inch.

BATTERY:—Prest-O-Lite, Type A-613-SH. Starting capacity is 130 amperes for 20 minutes. Lighting capacity is 5 amperes for 22.5 hours. The positive (+) terminal is grounded. Battery is mounted in special compartment built in right front fender.

IGNITION:—Coil Model 552-A. Distributor Model 656-J. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 40° (engine). Automatic advance starts at 600 R.P.M. and reaches a maximum of 20° (engine) at 2200 R.P.M. of the crankshaft. Breaker has two sets of contacts operating on a three sided cam opening alternately at intervals of 60° corresponding to 120° of crankshaft rotation. This firing interval must be accurately set (see Timing). Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod. Then remove advance stop screw and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head and turn down two turns every two weeks or each 500 miles. Place a small bit of vaseline on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 2 inches before top dead center (on the flywheel) with the spark control lever in the fully advanced position. With piston No. 1 in this position the flywheel mark 'UDC Cyl. 1 & 6' will be 2 inches before the indicator on the flywheel housing. To set timing, crank engine until piston No. 1 reaches the firing position. Make certain that manual spark control lever is in the fully advanced position. If breaker contacts are not beginning to separate, loosen advance arm clamp screw and rotate distributor until contacts on stationary breaker begin to separate. Tighten the clamp screw. Use special Delco-Remy Part No. 820751 to check second set of breaker contacts mounted on movable plate. Place the synchronizing gauge on the cam placing the clamp on the flat side of the cam with slot in shaft toward left side of gauge. Turn shaft in clockwise direction until graduations on left scale are near slot in distributor housing. Continue to turn shaft and note reading on scale opposite the edge of the slot when stationary set of contacts separate. Continue to rotate shaft until same reading on the other scale is opposite the slot in the distributor. If second set of contacts are not separating, loosen two lock screws on mounting plate and turn eccentric adjusting screw until contacts separate. Tighten the two lock screws. Use a test lamp or the dash ammeter to note instant the contacts separate. The contact gap must be kept within the limit of .020-.024 inch. This must be checked after setting timing.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are 1/32 inch.

STARTER:—Model DH-695. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The starter is a six pole, two brush machine having one field coil which is so constructed that it winds around three sides of each pole alternating from one to the next so that each pole is surrounded by a 'U' shaped section of the coil.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	6	60
25 "	Lock	3.5	650

Mounting:—Starter is mounted at left of engine by a standard sleeve mounting. To remove starter, disconnect starter cable and remove large pilot mounting screw. Slide starter forward and lift from place.

Oiling:—Starter bearings have oilless bearings. They require no attention.

OWEN-DYNETO GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model CG-678. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field in conjunction with special compensating field. The generator has two shunt fields each wound on two field poles. The light shunt field is connected between one main brush and the third brush and regulates the output. The heavy shunt field is connected between the third brush and the other main brush. The battery is connected between the same brushes as the light shunt field. Maximum charging rate of 16 amperes is reached at 800-900 RPM.

Generator Data		
Amperes	Volts	RPM
0	62	385-400
9	68	550-600
16	74	800-900
8	70	3500

The light shunt field draws 2 amperes at 6 volts. Heavy shunt field draws 75 amperes at 6 volts. Generator motoring draws 55 amperes at 6 volts. To adjust generator output, loosen the screw in the center of the knurled nut on the generator endplate, and turn the nut to the right to increase the charging rate and to the left to decrease the charging rate. Tighten the screw after making the adjustment. Raising the third brush does not render the generator inoperative and it should never be run this way. Two brushes must be raised. If the generator is to be run with the battery disconnected, remove the relay cover and connect the two screws holding the relay to the generator frame. If the generator cuts in late and does not produce over 7 amperes at peak, a short exists in the armature or the light shunt field is open. If the generator cuts in late and the output continues to increase at speeds over 2000 RPM the heavy shunt field is open. If the output exceeds 11 amperes at 3000 RPM but does not exceed the peak the heavy shunt field is shorted. The drive end bearing for the generator is in the engine and the machine must not be run on the bench until a special bearing is bolted on. This is Owen-Dyneto Part No. 22196.

Mounting:—Generator is flange mounted at right of engine. To remove generator, remove three flange mounting screws and pry the generator to the rear, using a screwdriver to separate the generator from the bronze plate which must be left in the engine. Be careful not to disturb the plate or the timing chain will be disturbed, making it necessary to set valve timing of the engine.

Oiling:—Drive end bearing of the generator is oiled by splash from the chain case. Put 4 or 5 drops of light engine oil in the commutator end bearing every month or each 1000 miles.

RELAY:—Relay is mounted on top of the generator. Relay closes at 385-400 RPM when the voltage of the generator reaches 62 volts and opens with a discharge current of 0.2 amperes. Relay contacts separate .015 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1317. Lighting switch is mounted at base of steering column. Head lamps are 6-8 volt, 21 cp double filament using second 21 cp filament instead of dimming. Auxiliary head lamps (in head lamps) are 6-8 volt, 3 cp DC. Dome lamp is 6-8 volt 3 cp SC. Dash, tail and tonneau lamps are 6-8 volt, 3 cp SC. Stop and backing lamps are each 6-8 volt, 21 cp SC.

CIRCUIT BREAKER:—Model 5773. A vibrating circuit breaker is mounted on the dash. It begins to operate at 20-30 amperes limiting the current to 12-15 amperes. Circuit breaker contacts separate .012-.030 inch.

MODEL 76 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L., Type XY-13X-6, 6 volts, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 90 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on right frame member under front seat.

IGNITION:—Coil Model 525-C. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Coil is mounted on the dash.

Distributor Model 641-A. Breaker contacts separate .020 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 22 degrees reached at 2600 R.P.M. Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables intact. Then use a pry under extension on distributor sleeve; prying lightly and tapping opposite side of sleeve will pull the distributor out of motor head. Electrolock Type 5A is used. See Page S-13.

Oiling:—Turn grease cup one complete turn every 1000 miles. Refill with good grade of medium cup grease.

Timing:—To replace distributor after removing, take out large pipe plug in flywheel housing at starter flange; turn motor over until No. 1 piston is coming up on the compression stroke, turn over slowly and watch flywheel markings through plug hole, stop turning when mark '1-6 D.C.' lines up in hole; adjust distributor so as to be ready to break on No. 1; press distributor sleeve into place with extension straight out at right angle to motor; rock distributor shaft slightly so as to engage shaft coupling without damage.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 3/8 inches; stem diameter, 11/32 inch; stem length, 5 25/32 inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds. Tappet clearance, .006-.008 inch. Inlet valves open at top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 11/32 inch; stem length, 5 25/32 inches. Valve lift, 11/32 inch. Spring pressure, 36 pounds. Tappet clearance, .006-.008 inch. Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 716-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
15 "	Lock	3.7	450

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, remove cable, take out fulcrum pin in switch lever, take out the 3 cap screws on flange and lift out starter.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless.

Continued on reverse side.

AUBURN

MODEL 76 (1928)

DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 949-C. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. putting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 21 amperes (cold) or 12 amperes (hot) reached at 1450 R.P.M.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, loosen mounting bracket screws; push generator and water pump towards crank case, pry off belt. Remove water and oil connections to pump; take out generator mounting screws, lift out generator and pump assembly. Radiator must be drained before the pump can be removed.

Oiling:—Put 4 or 5 drops of light oil in the generator oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 575 R.P.M. of armature or 12 M.P.H. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current is approximately 2 amperes at closing of contacts. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Soreng-Manigold Switch, Model 360-A. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21 and 3 cp. (special double filament bulbs using 3 cp. filament for dimming). Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse is 20 amperes.

AUBURN
Model 88 (1928)
Delco-Remy System
Plate No. 1307

AUBURN

MODEL 88 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L., Type XY-13X-6, 6 volt, 13 plates. The starting capacity (20 minutes rate) is 90 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted on right frame member under front seat. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-C. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Ignition coil is mounted on the dash.

Distributor Model 657-E. Breaker contacts separate .022 inch with breaker arm on lobe of cam. Adjust contact opening by loosening lock screw on stationary contact plate and turning eccentric adjusting screw to secure proper opening. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. There are two sets of contacts on a four sided cam opening alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This firing interval must be correctly set. See Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 15-17½ degrees reached at 2000 R.P.M.

Mounting:—Distributor is mounted on cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables intact. Then use a pry under extension on distributor sleeve. Prying lightly and tapping opposite side of sleeve will pull the distributor out of the motor head. Electrolock Type 5A is used. See Page S-13.

Oiling:—Turn grease cup one complete turn every 1000 miles. Refill with good grade medium cup grease.

Timing:—Synchronization of Contacts. To synchronize contacts, use Delco-Remy Tool, Part No. 820738, and follow directions on Page S-2. Contacts can be synchronized without tool after distributor is correctly timed to engine by cranking engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach top dead center entering power stroke. The second set of contacts should separate at this point. If they do not, loosen lock screws on breaker plate and turn eccentric adjusting screw until contacts begin to separate. Check contact opening with breaker arm on lobe of cam. If it is not within limits of .018-.024 inch, reset contact opening at .022 inch and repeat synchronization.

To Time Distributor to Engine:—Remove large pipe plug in flywheel housing at starter flange; turn motor over until No. 1 piston is coming up on the compression stroke, turn over slowly and watch flywheel markings through plug hole, stop turning when mark '1-8 D.C.' lines up in hole; adjust distributor so as to be ready to break on No. 1; press distributor sleeve into place with extension straight out at right angles to motor, rock distributor shaft slightly so as to engage shaft coupling without damage.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 13/8 inches; stem diameter, 11/32 inch; stem length, 5 25/32 inches. Valve lift, 11/32 inch. Spring pressure, 47 pounds. Tappet clearance, .006-.008 inch. Inlet valves open at top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 11/32 inch; stem length, 5 25/32 inches. Valve lift, 11/32 inch. Spring pressure, 36 pounds. Tappet clearance, .006-.008 inch. Exhaust valves open 50 degrees before lower dead center and close 10 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

MODEL 115 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L., Type XY-15X-6, 6 volt, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted on right frame member under front floor boards.

IGNITION:—Coil Model 525-A. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Coil is mounted on the engine side of the dash.

Distributor Model 657-D. Breaker contacts separate .022 inch. To adjust contact opening, loosen lock screw on stationary contact plate and turn eccentric adjusting screw until proper contact opening is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. There are two sets of contacts on a single cam opening alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This firing interval is very important and must be correctly set. See 'Synchronization of Contacts' under Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 17 degrees reached at 3600 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables intact. Then use a pry under extension on distributor sleeve; prying lightly and tapping opposite side of sleeve. This will pull distributor out of motor head. Electrolock Type 5A is used. See Page S-13.

Oiling:—Turn grease cup one complete turn every 1000 miles. Refill with good grade of medium cup grease.

Timing:—**Synchronization of Contacts:**—To synchroize contacts use Delco-Remy Tool, Part No. 820738, and follow directions given on Page S-2. The contacts can be synchronized without the use of this tool after the distributor has been timed to the engine. Crank the engine over 90 degrees from the firing position of cylinder No. 1 when piston No. 6 will reach top dead center entering power stroke. The second set of breaker contacts should separate at this point. If they do not, loosen the lock screws on the breaker plate and turn the eccentric adjusting screw until contacts begin to open. Then tighten the lock screws and check contact opening with breaker arm on lobe of cam. If contact opening is not within limits of .018-.024 inch, reset at .022 and repeat synchronization.

Timing of Distributor to Engine:—Remove the plate on top of the flywheel housing. Turn the motor over until No. 1 piston is coming up on the compression stroke, turn over slowly and watch flywheel markings through hole in flywheel housing; stop turning when mark '1-8 D.C.' lines up in hole; adjust distributor so as to be ready to break on No. 1; press distributor sleeve into place with sleeve extension pointing to the right across motor; rock distributor shaft slightly so as to engage shaft coupling without damage.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—**Specifications:**—Head diameter, 1 15/32 inches; stem diameter, 11/32 inch; stem length, 5 7/16 inches. Valve lift, 5/16 inch. Spring pressure, closed, 37 pounds. Tappet clearance, .006 inch (hot). Valve stem guides are removable. Oversize valve stems are not made.

Timing:—Inlet valves open at top dead center and close 45 degrees past lower dead center. Exhaust valves open 50 degrees before lower dead center and close 10 degrees past top dead center.

STARTER:—Model 718-A. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through a Bendix drive.

Continued on reverse side.

AUBURN

MODEL 115 (1928)

DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable, take out fulcrum pin in switch lever, take out the cap screws in the flange and lift out starter.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless.

GENERATOR:—**Model 949-A.** The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165 degrees F. putting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 21 amperes (cold) or 12 amperes (hot) reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Generator brush spring tension is 24-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, take off hose connections at water pump, loosen plate on front of chain case and swing out of the way. Loosen generator flange nuts, push generator towards motor, lift off chain from sprocket; keep chain from dropping down in chain case by fastening up with wire. Radiator must be drained before generator is removed.

Oiling:—Put 4 or 5 drops of light oil in the generator oilers every 1000 miles.

RELAY:—**Model 265-B.** Relay is mounted on the generator. Relay closes at 575 R.P.M. of armature or 12 M.P.H. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed. Charging current at closing of contacts is approximately 2 amperes.

LIGHTING:—**Soreng Manifold Switch Model 360-A.** Switch is mounted on lower end of steering column. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Side lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome and corner lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse is 20 amperes capacity.

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

BATTERY:—(Model 114½) Exide, Type 3-XC-13-IG, 6 volt, 13 plates. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.6 hours.

(Models 120, 128) Exide, Type 3-XC-15-IG, 6 volt, 15 plates. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. The negative (—) terminal is grounded. Battery is mounted under the front floor boards on the right frame member.

IGNITION:—Coil Model 2188. Coil is mounted on the generator at the right of engine. Ignition current is 4 amperes at 6 volts with engine stopped and 2 amperes at 6 volts with engine running. A ballast resistor is connected in series with the primary at one terminal of the coil.

Distributor Model 640-A. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Set contact opening by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 24 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 19 degrees reached at 2400 R.P.M.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Disconnect manual advance rod and remove stop screw in advance arm. Lift distributor from place.

Oiling:—Distributor shaft is oiled from the gear case. Oil gears with Zerk gun through connection on side of gear compartment every 500 miles. Remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the shaft and put a small amount of vaseline on the face of the breaker cam every 2000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 17 degrees before top dead center (on the flywheel) with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Remove cover over peephole in crankcase over flywheel on right of engine and continue to crank engine until the flywheel mark 'ADV 17°' is directly opposite the line on the edge of the hole. The rotor must be opposite the segment connected to the spark plug in cylinder No. 1 (see diagram). If it is not, remove manual advance stop screw and lift distributor to disengage gears. Then rotate rotor and shaft until rotor is directly opposite proper segment, remesh gears and replace stop screw. Then loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Connect the segment opposite the rotor to spark plug in cylinder No. 1 and connect remaining plugs in order 4-2-6-3-5 clockwise around the distributor head.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are ⅞-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—(Series 114½). **Specifications:**—Head diameter, 1 7/16 inches; stem diameter, ⅜ inch; valve lift, 21/64 inch; spring pressure, 53 pounds (valve closed). Tappet clearance, .008 inch (hot).

Timing:—Inlet valves open at top dead center and close 54 degrees after lower dead center. Exhaust valves open 62 degrees before lower dead center and close 25 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

(Series 120 and 128). **INLET VALVES:**—Head diameter, 1 7/8 inches; stem diameter, ⅜ inch; valve lift, 21/64 inch. Spring pressure, 55 pounds (valves closed). Tappet clearance, .008 inch (hot). Inlet valves open at top dead center and close 54 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, ⅜ inch; valve lift, 21/64 inch. Spring pressure, 55 pounds (valve closed). Tappet clear-

Continued on reverse side.

BUICK

DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

ance, .008 inch (hot). Exhaust valves open 62 degrees before lower dead center and close 25 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 725-A. Starter is connected to the engine through a manually operated pinion shift interconnected with the starting switch and a Delco clutch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15.5 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect pedal rod and cable and remove 3 flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the commutator end oiler every 1000 miles. The drive end bearings are oilless.

GENERATOR:—Model 940-F. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove commutator cover band and loosen the small round headed screw on the end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 18-20 amperes (cold) reached at 1450 R.P.M. or approximately 25 miles per hour.

Generator Data					
Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
18-20	8.5	1450	9-12	7.5	2000

Motoring generator draws 5.5-6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts directly across field terminals. Brush spring tension is 22-26 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing gear case. To remove generator, disconnect all ignition wires and controls or remove distributor. Then disconnect generator lead and water pump coupling. Drain radiator, remove pump mounting studs and remove water pump. Then remove three flange mounting cap screws. Pull generator to rear and lift from place.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the commutator end of the generator every 500 miles. The drive end bearing is oiled by splash from the timing gear case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at approximately 8 M.P.H. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side (parking), tonneau and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash light (direct lighting) is 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash light (indirect lighting) is 6-8 volt, 6 cp. S.C. Mazda No. 81.

Switches:—Lighting switch is Delco-Remy Model 484-A. It is mounted on the lower end of the steering column. Stop and backing light combination switch is Delco-Remy Model 466-B.

CIRCUIT BREAKER:—Delco-Remy Model 410-A. A vibrating circuit breaker is mounted on the back of the dash. It begins to operate with a current of 25-30 amperes and continues to vibrate limiting the current to 10-15 amperes until the short circuit is repaired.

CADILLAC

SERIES 341-A (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

CADILLAC

341-A (1928)
Delco-Remy System

Plate No. 1310

BATTERY:—Exide, Type 3-LXRV-15-2G, 6 volt. Starting capacity is 137 amperes for 20 minutes. Lighting capacity is 5 amperes for 26 hours. The positive (+) terminal is grounded. Battery is mounted on right side of car on right frame member under the dust shield. This battery is not interchangeable with battery used on Series 314 Cadillac because filler plugs are located on opposite side of cap.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts whenever necessary with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 38° (engine) or 20° distributor. Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° (engine) reached at 3000 R.P.M. (engine). Breaker arm spring tension is 16-20 ounces. There are two sets of breaker contacts set at an angle of 135° and operating on a four lobed cam. Contacts open alternately at intervals of 45° corresponding to 90° of crankshaft rotation, which is the correct firing interval for the Cadillac engine. This must be accurately set. (See Timing.)

Mounting:—Ignition coil is mounted on side of distributor mounting. Distributor is mounted at front of engine between the cylinder banks. The ignition system is fitted with an Electrolock switch on the dash which must be removed with the distributor when the distributor is taken off the car. To remove the distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold down screw and lift the distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 822572, and follow directions given on Page S-1. This is important and contacts must be synchronized when distributor timing is checked.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position $\frac{7}{8}$ inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1R in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is $\frac{7}{8}$ inch before top dead center. To set timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Then continue to crank engine until flywheel mark 'IG/A-1-5' is opposite the indicator on the case. If contacts are not beginning to separate, loosen the taper screw in the center of the cam and rotate cam until one set of contacts open. The other set will be open but just closing. Tighten the screw. The second set of contacts open 45 degrees (distributor) after this point with the flywheel mark IG/A-2-6' opposite the indicator. These directions apply only to standard compression engines. For high compression engines see following paragraph.

Special Directions for Timing High Compression Engines:—On Cadillac engine with high compression heads (with letters 'H.C' cast in head) contacts separate with the piston $\frac{1}{2}$ inch (on the flywheel) before top dead center. The engine should be cranked over until a point approximately half way between the 'IG/A-1-5' mark on the flywheel and the top dead center mark is opposite the indicator. Contacts should separate at this point. On engines with high compression heads the spark plug gap must be set at .026 inch.

Valve Timing:—**INLET VALVES:**—Head diameter, $1\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, $6\frac{17}{64}$ inches (over all); valve lift, $\frac{23}{64}$ inch; spring pressure, 133-139 pounds compressed to $2\frac{5}{32}$ inches; tappet clearance, .004 inch (cold). Inlet valves open $11^{\circ} 2'$ before top dead center and close $58^{\circ} 38'$ after lower dead center with cold engine.

EXHAUST VALVES:—Head diameter, $1\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, $6\frac{1}{4}$ inches (over all); valve lift, $\frac{23}{64}$ inch; spring pressure, 133-139 pounds compressed to $2\frac{5}{32}$ inches; tappet clearance, .006 inch (cold). Ex-

Continued on reverse side.

CADILLAC

SERIES 341-A (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

haust valves open $38^{\circ} 12'$ before lower dead center and close $7^{\circ} 38'$ after top dead center with cold engine. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1L-4R-4L-2L-3R-3L-2R-1R. The right hand cylinder bank is right viewed from the driver's seat. Number one cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Spark plug gaps on standard compression engines are .032 inch. Gaps on high compression engines must be set at .026 inch.

STARTER:—Model 382. Starter is connected to the engine through a mechanical pinion shift interconnected with the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
4.5 lb. ft.	750	5	200
19 "	Lock	3	600

Mounting: Starter is mounted at right of engine on rear of flywheel case. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then pull starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 165°F . inserting a resistance in the field circuit and reducing the output approximately 2.5 amperes. Generator output is adjusted by shifting third brush. Remove commutator cover band and shift third brush mounting plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction washers. The maximum charging rate of 18-20 amperes at 8.6 volts is reached at 1400-1600 R.P.M. or 22-25 M.P.H.

22-25 M.I.H.

Generator Data					
Cold Test 75°F.			Hot Test 175°F.		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20.....	8.2-8.62.....	1450	10-12.....	7.3-7.7.....	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Generator brush spring tension is 16-20 ounces.

Mounting:—Generator is mounted at right of engine and is driven by silent chain in tandem with the water pump. To remove generator, disconnect wire and remove three mounting nuts. Then pull generator to rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at 8-10 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch Model 1313 is mounted at lower end of steering column. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Inspection lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail, tonneau, dome, corner and step lamps are each 6-8 volt, 3 cp. S.C.

CIRCUIT BREAKER:—Model 5759. A combination vibrating and lockout circuit breaker is mounted on the dash. The vibrating unit protects the lighting circuits. It begins to operate at 25-30 amperes limiting the current flow to 10-15 amperes. The lockout circuit breaker protects the horn, stop lamp, inspection lamp, cigar lighter and body lamps. It opens the circuit when the current reaches 25-30 amperes and operate with a discharge current of less than 1 ampere.

DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minutes rate) is 102 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the front floor boards on the left side member.

IGNITION:Coil Model 525-C. Ignition coil is mounted on bracket at front of engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 633-B. Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 22 degrees (engine) reached at 2600 R.P.M.

Mounting:—Distributor is mounted on accessory bracket at right front of engine. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then remove set screw on side of distributor shaft and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Every month put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Continue to crank engine until piston No. 1 reaches top dead center when flywheel mark 'DC 1&6' will be opposite indicator mark on flywheel housing. Loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—**Specifications:**—Head diameter, 1 15/32 inches; stem diameter, 5/16 inch; stem length, 5 1/8 inches. Valve lift, 5/16 inch. Tappet clearance, .009 inch. Spring pressure, 70 pounds. Valve stem guides are removable. Over-size valve stems are not made.

Timing:—Inlet valves open 16 degrees before top dead center and close 51 degrees after lower dead center. Exhaust valves open 64 degrees 30 minutes before lower dead center and close 21 degrees after top dead center.

STARTER:—Model 717-A. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	70
11 "	Lock	3.63	450

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Pull starter forward and lift from place.

BATTERY:—Prest-O-Lite, Type 615-JFK, 6 volt, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 525-C. Coil is mounted on horn bracket at right front of engine. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 633-C (Model 35-A). Breaker contacts separate .018-.024 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-20 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees of engine. Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 22 degrees reached at 2600 R.P.M.

Distributor Model 641-C (Model 135). Breaker contacts separate .018-.024 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 22 degrees. Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 30 degrees of engine reached at 3000 R.P.M.

Mounting:—Distributor is mounted on the rear of the generator at the right of the engine. To remove distributor, disconnect primary lead and manual advance lever and remove distributor head with cables intact. Then remove set screw in side of shaft and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down one turn every month. Each month put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Continue to crank engine until piston No. 1 reaches top dead center when the flywheel mark 'DC 1&6' will be directly opposite the pointer on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw. Make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1 and connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 23/32 inches; stem diameter, 3/8 inch; stem length, 6 9/16 inches. Valve lift, 5/16 inch. Tappet clearance, .009 inch (hot). Spring pressure, 70 pounds. Valve stem guides are removable. Over-size valves are not made.

Timing:—Inlet valves open 16 degrees before top dead center and close 51 degrees after lower dead center. Exhaust valves open 64 degrees 30 minutes before lower dead center and close 21 degrees after top dead center.

STARTER:—Model 720-W. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces.

Continued on reverse side.

Continued from preceding page.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing under the crankcase flange. To remove starter, disconnect cable and remove flange mounting cap screws and stud extending through crank case flange. Then pull starter forward and lift from place.

Oiling:—Put 5 or 6 drops of light oil in the oiler on the commutator end of the starter every month or each 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 944-C. The direction of rotation is counter-clockwise, looking at the commutator end of the generator. Current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 19 amperes (cold) reached at 1300 R.P.M. or 22 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1300	9-12	7.6	1400

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 22-28 ounces.

Mounting:—Generator is base mounted on special bracket at right of engine and is driven by extension of water pump shaft. To remove generator, disconnect lead and water pump coupling. Remove distributor. Then remove nuts from two base mounting studs and lift generator from place.

Oiling:—Put 4 or 5 drops of light oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 500 R.P.M. when the generator voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Clum Switch Model 10677. Switch is located at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Side, stop, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Fuses are 20 amperes capacity.

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

CHANDLER
Model 37 and 137 (1928)
Delco-Remy System

Plate No. 1313

BATTERY:—Prest-O-Lite, Type 613-JFK, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 102 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under front floor boards on the right frame member.

IGNITION:—Coil Model 525-C. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Coil is mounted in the right front frame channel.

Distributor Model 658-G (Model 37-A). Breaker contacts separate .022 inch with breaker arm on lobe of cam. Set contact gap by loosening lock screw on stationary contact plate and turning eccentric adjusting screw until proper setting is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Breaker uses two sets of contacts on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Chandler engine and breaker must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 33 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 35 degrees reached at 2400 R.P.M.

Distributor Model 657-A (Model 137). Data identical with Model 658-G.

Mounting:—Distributor is mounted on the front of the generator at the right of the engine. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then loosen distributor clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down one turn every month or each 1000 miles. Every month remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light oil. Put a small bit of vaseline on the breaker cam.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 820738, and follow directions on Page S-2 of Reed Service Manual. Contacts can be synchronized without tool after distributor has been timed to engine by cranking engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach top dead center entering power stroke. The second set of contacts should separate at this point. If they do not, loosen lock screws and turn eccentric adjusting screw on breaker plate until contacts begin to open. Tighten the lock screw and check the contact gap with the breaker arm on the lobe of the cam. If it is not within limits of .018-.024 inch reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever. Continue to crank engine until piston No. 1 reaches top dead center when the flywheel mark 'DC 1&8' will be directly opposite the indicator on the flywheel case. Loosen advance arm clamp screw and turn distributor housing until contacts begin to separate. Tighten the clamp screw. Make certain that the rotor is opposite the segment connected to the spark plug in cylinder No. 1 and connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .020 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 23/32 inches; stem diameter, 3/8 inch; stem length, 6 13/32 inches. Valve lift, 5/16 inch. Tappet clearance, .009 inch. Spring pressure, 95 pounds. Inlet valves open 16 degrees before top dead center and close 51 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; stem length, 6 13/32 inches. Valve lift, 5/16 inch. Tappet clearance, .009 inch.

Continued on reverse side.

Spring pressure, 95 pounds. Exhaust valves open 64 degrees 30 minutes before lower dead center and close 21 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 727-A. Starter is connected to the engine through reduction gears and an outboard Bendix drive. The direction of rotation of the armature shaft is clockwise, looking at the commutator end. Starter switch is Model 405-C. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2500	5	70
28 "	Lock	3	600

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting studs. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light oil in each of the starter bearing oilers every two weeks or each 500 miles. Every six months remove the grease plug in the reduction gear compartment and repack gears with medium cup grease.

GENERATOR:—Model 944-D. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screws after making the adjustment. With standard car setting, maximum charging rate is 19 amperes reached at 1300 R.P.M. or 20 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19	8.5	1300	12	7.65	1500

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect generator lead and remove distributor. Then remove 3 flange mounting cap screws and slide generator to the rear. Make certain that timing chain does not slip off generator drive sprocket as this will throw off valve timing of engine.

Adjustment of Timing Chain:—Timing chain is adjusted by loosening two upper flange mounting screws and moving generator outward. Make adjustment with engine running and move generator until chain hums. Then slack up on chain tension until the noise disappears. Tighten the cap screws. It is very important not to get too much tension on the chain. With correct setting the chain will operate noiselessly.

Oiling:—Put 8 or 10 drops of light oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 500 R.P.M. when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Clum Switch Model 10577. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash, tail, side and corner lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuses are 20 amperes capacity.

NATIONAL MODEL (1928)

DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type XW-13. Exide, Type 3-XC-13-1. U.S.L., Type XY-13, 6 volt, 13 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 284-W. Coil is mounted on right of engine on top of oil filter. Ignition current is 2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 635-B. Breaker contacts separate .018-.024 inch. Set contact opening by loosening lock screw on stationary contact plate and turning eccentric adjusting screw until proper gap is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 14-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25 degrees (engine). Automatic advance begins at 1000 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2400 R.P.M. Distributor rotation is clockwise viewed from the top.

Mounting:—Distributor is mounted on side of engine block at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then back off set screw on side of shaft and lift distributor from place.

Oiling:—Put one drop of light oil on breaker arm pivot pin every 500 miles. Fill the grease cup on the side of the shaft and turn down one half turn every 1000 miles.

Timing:—Breaker contacts separate when the piston entering power stroke reaches top dead center with the manual advance lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Then continue to crank engine until the flywheel mark '25' is opposite the pointer in the peephole in the front of the flywheel housing on the right side. Check distributor to see that rotor is pointed at right angles from the engine block away from the engine. If it is not in this position loosen set screw, pull distributor straight up to disengage gears and turn until rotor reaches proper position. Then remesh gears and tighten set screw. Fully advance spark control lever. Loosen clamp screw and turn distributor housing in a counter-clockwise direction until contacts begin to separate. Tighten the clamp screw and connect outer terminal to spark plug in cylinder No. 1. Connect remaining spark plugs in order 2-4-3 clockwise around the distributor head.

Firing Order:—The firing order is 1-2-4-3.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .020-.030 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 21/32 inches; stem diameter, 5/16 inch; stem length, 4 inches. Valve lift, 9/32 inch. Tappet clearance, .006 (intake) and .008 (exhaust) inch, hot. Valve stem guides are not removable. Oversize valve stems are not made.

Timing:—Inlet valves open 7 degrees before top dead center and close 75 degrees after lower dead center. Exhaust valves open 56 degrees before lower dead center and close 32 degrees after top dead center.

STARTER:—Model 710-D. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces each. Starter switch is Model 405-C. Starter cranks the engine at 140 R.P.M. drawing 100 amperes at 4.8 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every 500 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen small round headed screw on generator end plate and remove commutator cover band. Then shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting maximum charging rate is 18 amperes (cold) reached at 2100 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
14-16	8	1700	12	7.5	1800

Shunt field current is 5 amperes at 6 volts. Brush spring tension is 16-18 ounces.

Mounting:—Generator is mounted at left front of engine by special swing mounting and is driven by the fan belt. To remove generator, disconnect lead, loosen clamp bolt and swing generator toward engine. Slip off drive belt, remove two mounting bolts in swing mounting and lift generator from place.

Belt Tension Adjustment:—Fan belt tension is adjusted by loosening clamp bolt in front flange and pulling generator away from engine block until proper tension is secured. Be careful not to get belt too tight.

Oiling:—Put 4 or 5 drops of light oil in each oiler every 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 8 miles per hour or 750 R.P.M. (armature) when the generator voltage reaches 6.75-7.5 volts and opens at 6 miles per hour or 560 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 476-C. Switch is mounted on instrument panel. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Cowl lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse on switch is 20 amperes capacity.

DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-6, 6 volt, 17 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 166 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30.6 hours. Battery is mounted under front floor boards on left frame member.

IGNITION:—Coil Model 525-E. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Coil is mounted on the dash.

Distributor Model 659-A or 659-B. Breaker contacts separate .022 inch with breaker arm on lobe of cam. To set contact opening, loosen lock screw on stationary contact plate and turn eccentric adjusting screw until proper contact opening is secured. Resurface contacts with a fine flat contact file or on a medium hard oil-stone. Breaker arm spring tension is 17.5-20.5 ounces. The breaker has two sets of breaker contacts on a three sided cam opening alternately at intervals of 60° corresponding to 120° of crankshaft rotation. This firing interval is very important must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 25° (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 22° (engine) reached at 2900 R.P.M. An electrolock is used on the distributor. Whenever the distributor requires service, the entire distributor and electrolock should be removed as a unit and replaced.

Mounting:—Distributor is mounted on top of cylinder block. To remove distributor, disconnect manual advance rod and remove head with cables intact. Remove manual advance stop screw and lift distributor from place. The distributor and electrolock must be removed as a unit.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every 500 miles. Put a small bit of vaseline on the face of the breaker cam every 500 miles.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 829751, and follow directions on Page S-2. Connect a 6 volt lamp in series with primary circuit at coil to accurately determine when contacts open. The lamp will go out at the instant the contacts separate. After synchronizing contacts, check contact opening. If it is not within limits of .018-.024 inch, reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when piston entering power stroke reaches a position .035 inch before top dead center with the manual spark lever fully advanced. A variation of plus or minus .005 inch is allowable with piston position limits of .040-.030 inch before top dead center. To set timing, crank engine until piston No. 1 reaches firing position. Fully advance spark lever and loosen advance arm clamp screw. Rotate distributor until one set of contacts begins to separate. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1. These directions apply only to standard engines with compression ratio of 4.75 to 1. For Red Head engines with 6 to 1 compression see following paragraph.

Special Directions for RED HEAD Engine Timing:—On Red Head engines breaker contacts separate with the piston entering power stroke on top dead center with the manual spark lever fully advanced. The allowable variation is plus or minus .0005 inch with piston position limits .0005 inch before or after top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .027-.030 inch. Special plugs are used in Red Head Engines.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 13/16 inches; stem diameter, 3/8 inch; stem length, 7 inches. Valve lift, 5/16 inch. Spring pressure, 57 pounds closed and 94 pounds open. Tappet clearance, .006 inch. Inlet valves open 6° past top dead center and close 46° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 15/16 inches; stem diameter, 3/8 inch; stem length, 7 inches. Valve lift, 5/16 inch. Spring pressure, 57 pounds

Continued on reverse side.

closed and 94 pounds open. Tappet clearance, .008 inch. Exhaust valves open 46° before lower dead center and close 8° past top dead center. Valve stem guides are removable. Oversize valve stems are not made. Special material valves are used in Red Head engines.

STARTER:—Model 728-A. Starter is connected to the engine through a Bendix drive. The direction of rotation of the armature shaft is clockwise, looking at the commutator end. Starter cranks the engine at 110 R.P.M. drawing 130 amperes at 5.2 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 404-T.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.7	65
1 "	1520	5.5	100
4 "	760	5.0	200
10 "	460	4.5	300
15.5 "	260	4.0	400
19.5 "	120	3.5	500
26 "	Lock	3.0	600

Mounting:—Starter is sleeve mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and shift lever and remove large pilot mounting screw from housing directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the starter bearing oiler every 1000 miles.

GENERATOR:—Model 949-Q. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts into the field circuit and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 19 amperes (cold) reached at 1600 R.P.M. or 27 miles per hour.

Generator Data

Cold Test			Hot Test

19	8.4	1600	10	7.6	2600
10	7.5	3250			

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case by standard S.A.E. No. 4 flange mounting. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then pull generator to the rear being careful not to disturb intermediate flange carrying sprocket and timing chain. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light oil in the generator oilers every 1000 miles.

RELAY:—Relay Model 265-B. Relay is mounted on the generator. Relay contacts close at 600 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Clum Switch Model 10661. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second filament instead of dimming) Mazda No. 1110. Auxiliary head lights (in head lamps) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop, backing, dome, corner and tonneau lights are each 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CHRYSLER

MODEL 52 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type WXR-13, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 16.8 hours. The positive (+) terminal is grounded. Battery is mounted under floor boards of front compartment on left frame member.

IGNITION:—Coil Model 525-E. Distributor Model 630-A. Breaker contacts separate .018-.024 inch. Resurface contacts on a medium hard oilstone or with a fine flat contact file. To adjust contact opening, loosen lock screw located behind stationary contact and turn eccentric adjusting screw on crescent shaped contact mounting arm until desired breaker gap is obtained. Then tighten lock screw to hold adjustment. Distributor is of the semi-automatic type. Manual advance is 22 degrees. Automatic advance begins at 600 R.P.M. Maximum automatic advance is 18 degrees at 2180 R.P.M. Breaker arm spring tension is 17-21 ounces. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Mounting:—Distributor is mounted at front of engine and is accessible from the right side. Drive is by slotted tongue from the forward end of the cam shaft. To remove distributor, disconnect breaker lead and high tension cables or remove distributor head. Then remove two mounting bolts holding distributor bracket and gear case to forward end of engine gear case. Distributor can then be lifted from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every month or each 1000 miles. Keep the oiler on the distributor gear compartment filled with light engine oil.

Timing:—Breaker contacts begin to separate when piston entering power stroke reaches a position .063 inch before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the up stroke with both valves closed). Then continue to crank engine until pistons No. 1 and No. 4 reach a position .063 inch before top dead center. Make certain that the spark control lever is in the fully advanced position. Loosen the clamp screw holding distributor in position on spark control lever and rotate distributor until contacts begin to separate. Tighten the clamp screw and replace the rotor and distributor head. Make certain that the rotor is opposite the segment connected to spark plug in cylinder No. 1. In setting timing, a variation of .011 inch is allowable. Piston limits are .075-.052 inch before top dead center.

'RED HEAD' engines are specially timed. Breaker contacts separate with piston .004 inch before top dead center with spark fully advanced. Allowable variation is .002 inch. Piston limits are .002-.006 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .004 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; intake opens at top dead center and closes at 40° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/16 inches; stem diameter, 3/8 inch; stem length, 5 1/16 inches; tappet clearance, .006 inch (hot); spring pressure, 35-42 pounds; valve lift, 9/32 inch; exhaust opens at 48° before lower dead center and closes 2° past top dead center. Stem guides are removable. No over-size valve stems are made. Valves in 'RED HEAD' engines are of special material.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .030 inch. Special plugs are used in 'Red Head' engines.

STARTER:—Model 712-F. Starter is connected to the engine through an outboard Bendix drive Type R-11-X. The direction of rotation is counter-clockwise, looking

Continued on reverse side.

CHRYSLER

MODEL 52 (1928)

DELCO-REMY IGNITION

Continued from preceding page.

at the commutator end. Starter cranks the engine at 150 R.P.M. taking 150 amperes at 5 volts. Starter switch is Model 404-V. Starter brush tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.6	70
1.6 "	1560	5.2	150
3.0 "	1250	5.0	200
4.2 "	800	4.7	250
6.0 "	550	4.4	300
9.4 "	150	4.0	400
11.0 "	Lock	3.7	450

Mounting:—Starter is flange mounted at left of engine on forward side of bell housing. To remove starter, disconnect starter cable and remove two flange mounting screws. Then slide starter from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 miles. The bearing on the drive end is oilless.

GENERATOR:—Model 947-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust charging rate, remove the commutator cover band and loosen the small round headed screw on the commutator end plate of the generator. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. Maximum output is 17 amperes (cold) reached at 1800 R.P.M. or 20-22 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	775	0	6.4	850
4	6.8	925	4	6.8	1075
8	7.3	1100	6	7.0	1250
12	7.7	1375	10	7.5	1700
15	8.0	1800	11	7.6	2100
13	7.8	2500	10.6	7.5	2500
11	7.6	3000	9.4	7.4	3000

Shunt field current is 5 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is cradle mounted at front end of the engine and is belt driven. The fan is mounted on the forward side of the generator drive belt. To remove generator, disconnect generator lead and loosen the generator cradle stud nut which is the large nut directly under the generator holding the generator cradle bracket in position. Then lower generator and cradle and slip off drive belt. Loosen nut on generator mounting strap and slide generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on each end of the generator every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Briggs and Stratton Switch or Clum Switch Model 10607. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop lamp is 6-8 volt, 15 cp. S.C. Dome lamp is 6-8 volt, 15 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on back of switch is 20 amperes.

CHRYSLER

MODEL 62 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Willard, Type LWR-4, 6 volt. Starting capacity is 107 amperes for 20 minutes. Lighting capacity is 5 amperes for 18.6 hours. The positive (+) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 631A-B. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 25 degrees (engine). Automatic advance begins at 400 R.P.M. Maximum automatic advance is 18 degrees at 2600 R.P.M. Breaker arm spring tension is 15-21 ounces.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles if the car is driven more than 1000 miles a month.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .030 inch before top dead center with the spark control lever in the fully advanced position. A variation of .005 inch is permitted with piston limits at .025 and .035 inch before top dead center.

'RED HEAD' engines must be timed differently. Breaker contacts separate with piston .008 inch before top dead center with spark fully advanced. Allowable variation is .002 inch with piston limits at .004 and .008 inch before top dead center.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .004 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; inlet opens 3° after top dead center and closes 137° after top dead center (or 43° before lower dead center). EXHAUST VALVES:—Head diameter, 1 5/16 inches; stem diameter, 3/8 inch; stem length, 4 21/32 inches; tappet clearance, .006 inch; spring pressure, 72-80 pounds; valve lift, 5/16 inch; exhaust opens 135° after top dead center (or 45° before lower dead center) and closes 5° after top dead center. Valve stem guides are removable. Oversize valve stems are not made. Valves used on 'RED HEAD' engines are of special material.

Mounting:—Distributor is mounted on top of the cylinder head. To remove, disconnect manual advance rod and remove manual advance stop screw. Then lift distributor from place.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 inch. Gaps are .027-.030 inch. Special plugs are used in 'Red Head' engines.

STARTER:—Model 714-D. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 178 R.P.M., taking 164 amperes at 5.1 volts. Starter brush tension is 26 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5.0	65
2 "	1650	5.1	150
6 "	700	4.5	280
12 "	Lock	3.63	475

Switch:—Starting Switch is Model 404-T.

Mounting:—Starter is barrel mounted at left of flywheel housing. To remove starter, remove pilot screw on top of housing and slide starter from position.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every month or each 1000 if the the car is driven more than 1000 miles in a month.

CHRYSLER

MODEL 62 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 949-L. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen the small round headed screw on the generator end plate and shift the third brush. Shifting the brush in a counter-clockwise direction increases the charging rate, and in the opposite direction decreases the charging rate. Tighten the screw after making the adjustment. Maximum charging rate is 14-16 amperes reached at 1500 R.P.M. or 22 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.4	575	0	6.4	700
4	6.8	700	4	6.8	850
8	7.2	850	8	7.2	1050
12	7.8	1050	10.5	7.5	1250
15	8.0	1275	12	7.7	1575
16	8.1	1500	11	7.6	2000
14	7.9	2000	9.5	7.4	2500
11.5	7.6	2500			

Shunt field current is 5 amperes at 6 volts. Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is mounted at right of engine by a No. 3 S.A.E. flange mounting to the timing gear chain case. To remove generator remove cover plate on front of case and remove three nuts holding generator in place. Then slide generator to rear, removing chain, but being careful that chain does not slip over cam shaft sprocket, or engine camshaft timing will be disturbed.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every month or each 1000 miles if the car is driven more than 1000 miles in a month. The drive end bearing is oiled by splash from the gear case.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the generator reaches 600 R.P.M. with a terminal voltage of 7.25 volts and opens at approximately 500 R.P.M. with a discharge current of 0-2.5 amperes. Relay contacts separate .020 inch. Air gap between relay armature and coil core is .016 inch, contacts closed.

LIGHTING:—Clum Switch Model 10629. Head lamps are 6-8 volt, 21 cp. double filament using second 21 cp. filament instead of dimming. Stop and dome lamps are each 6-8 volt, 15 cp. S.C. Dash and tail lamps are each 6-8 volt, 3 cp. S.C. Auxiliary head lamps are 6-8 volt, 3 cp. S.C.

FUSES:—Lighting fuse on back of switch is 20 amperes.

Plate No. 1318

BATTERY:—Willard, Type SJRR-5, 6 volt. Starting capacity is 145 amperes for 20 minutes. Lighting capacity is 5 amperes for 27 hours. The negative (—) terminal is grounded. Battery is mounted on right side of chassis under the front floor board.

IGNITION:—Coil Model 2178. Distributor Model 5299. Breaker contacts separate .015-.020 inch. They are made of tungsten. Resurface contacts with a fine, flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 38° (engine). Automatic advance begins at 800 R.P.M. and reaches a maximum of 15° at 2100 R.P.M. Breaker has two sets of contacts on an eight sided cam. They must be synchronized to open at the same instant. Connect a six volt lamp in each primary circuit and shift breaker plate position until both lamps go out at the same instant. This will mean that contacts are correctly synchronized.

Mounting:—Distributor is mounted at the forward end of the engine between the cylinder banks. To remove distributor, disconnect manual advance rod and breaker lead and remove distributor head or disconnect high tension cables. **Then remove** One hold down screw in manual advance arm and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 on compression stroke reaches top dead center with the manual spark control lever in the fully retarded position. At this point the flywheel marking "EX.C.I.N.O." will be opposite the indicator on the flywheel case.

Valve Timing:—INLET VALVES:—Head diameter, 1 7/8 inches; stem diameter, .432 inch; stem length, 6 1/8 inch; tappet clearance, .0015 inch; spring pressure, 75 pounds; valve lift, 11/32 inch; intake opens at 5° past top dead center and closes 51° past lower dead center.

EXHAUST VALVES:—Head diameter, 1 7/8 inches; stem diameter, .432 inch; stem length, 6 1/8 inches; tappet clearance, .003 inch; spring pressure, 75 pounds; valve lift, 11/32 inch; exhaust opens at 41° before bottom dead center and closes 5° past top dead center. Stem guides are removable. No oversize valve stems are made.

Firing Order:—The firing order is 1R, 1L, 4R, 4L, 2L, 3R, 3L, 2R.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .031 inch.

STARTER:—Model 350. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is 2 1/4-2 1/2 pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	4	60
19 "	Lock	3	500

Mounting:—Starter is flange mounted at right of engine. To remove starter, disconnect starter cable and remove three flange mounting screws. Then slide starter from place.

Oiling:—Self-lubricating bearings are used. They require no attention.

Continued on reverse side.

CUNNINGHAM

SERIES V-7 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 285. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, loosen locknut in generator end plate and shift third brush. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the lock nut after making the adjustment. With maximum third brush setting the output is 18-20 amperes at 7.5 volts reached at 1600 R.P.M. or 25 M.P.H.

Generator Data

Amperes	Volts	R.P.M.
3.....		600
9.....		800
18-20.....	7.5	1600

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 3 amperes at 6 volts. Brush spring tension is 24-28 ounces.

Mounting:—Generator is cradle mounted on front end of motor and is accessible from the left side of engine. To remove generator, disconnect generator lead and remove lock nut and nut from hold down strap. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 5766. Relay is mounted on top of the generator. Relay contacts close when the voltage of the generator reaches 6.75-7.5 volts and open with a discharge current of 0-3 amperes. Relay contacts separate .015-.020 inch. Air gap between relay armature and coil core is .025-.035 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1281. Switch is mounted on the instrument board. Dimming is by resistance on switch. Head, stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Side, dome, corner, tonneau and step lights are each 6-8 volt, 6 cp. D.C. Mazda No. 82. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on back of the switch. A current of 25-30 amperes causes this device to operate. While vibrating the current is 10-15 amperes.

ACCESSORIES:—Waltham Clock.

DODGE

STANDARD SIX (1928) NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH EAST IGNITION

DODGE
Standard Six (1928)
North East System

Plate No. 1319

BATTERY:—Willard, Type SJWR-4. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is 6 volt, having 13 plates, each $5\frac{3}{4}$ inches wide, $5\frac{1}{4}$ inches high and $\frac{1}{8}$ inch thick. The negative (—) terminal is grounded. Battery is mounted under front seat on left side.

IGNITION:—Coil Type 19232. Ignition switch is located in coil. Coil is mounted on rear of instrument board. Ignition current is 1.0 amperes at 6 volts with engine running, and $5\frac{1}{2}$ amperes at 6 volts with engine stopped.

Distributor Type 10846. Breaker contacts separate .020 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Double contacts are used set to open at the same instant. This is important and contacts should be synchronized when ignition is checked. Distributor is semi-automatic. Maximum manual advance is 20° (flywheel). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20° (engine) reached at 2200 R.P.M. Breaker arm spring tension is 16 ounces.

Oiling:—Put a few drops of medium oil in the oiler on the side of the distributor housing. Remove rotor button and oil the felt wick in the center of the shaft. Put a small amount of vaseline on the face of the breaker cam under the fiber bumpers of the contact arms.

Mounting:—Distributor is mounted on cylinder head between cylinders 3 and 4. To remove distributor, disconnect manual advance rod and disconnect primary lead. Then remove head with high tension cables intact. Remove set screw in side of distributor mounting and lift distributor straight up.

Timing:—Breaker contacts begin to separate with Piston No. 1 before top dead center entering power stroke when flywheel mark 'IGN' is in center of the peephole in the left side of the flywheel housing under the starter. The manual spark lever must be fully advanced. The ignition mark on the flywheel is 4 degrees before top dead center. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark control lever and continue to crank engine until the flywheel mark is in the center of the peephole. Loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. With correct setting the backlash of the gears should be sufficient to open and close contacts. If ignition switch is turned on the ammeter will swing from '0' to 'Discharge' as the gears are rocked. Check the synchronization of the contacts to make certain that they open at the same instant.

VALVE TIMING:—INLET VALVES:—Head diameter, $1\frac{21}{32}$ inches; stem diameter, .371 inch; valve length, $5\frac{23}{32}$ inches (over all). Valve lift, $\frac{5}{16}$ inch. Tappet clearance, .004-.008 inch (hot). Spring pressure, 75 pounds (valve open). Inlet valves open at top dead center and close 48 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{17}{32}$ inches; stem diameter, .370 inch; valve length, $5\frac{23}{32}$ inches (over all). Valve lift, $\frac{5}{16}$ inch. Tappet clearance, .004-.008 inch (hot). Spring pressure, 75 pounds (valve open). Exhaust valves open 50 degrees before lower dead center and close 6 degrees after top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Gaps are .025 inch.

STARTER:—Model SB Type 6404. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 165-180 amperes at 5.5 volts. Brush spring tension is 3 pounds. Starter switch mounted on floorboard is Type 20238.

Continued on reverse side.

This is important and contacts should be synchronized when ignition is checked. Distributor is semi-automatic. Maximum manual advance is 20° (flywheel). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 20° (engine) reached at 2200 R.P.M. Breaker arm spring tension is 16 ounces.

Oiling:—Put a few drops of medium oil in the oiler on the side of the distributor housing. Remove rotor button and oil the felt wick in the center of the shaft. Put a small amount of vaseline on the face of the breaker cam under the fiber bumpers of the contact arms.

Mounting:—Distributor is mounted on cylinder head between cylinders 3 and 4. To remove distributor, disconnect manual advance rod and disconnect primary lead. Then remove head with high tension cables intact. Remove set screw in side of distributor mounting and lift distributor straight up.

Timing:—Breaker contacts begin to separate with Piston No. 1 before top dead center entering power stroke when flywheel mark 'IGN' is in center of the peephole in the left side of the flywheel housing under the starter. The manual spark lever must be fully advanced. The ignition mark on the flywheel is 4 degrees before top dead center. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark control lever and continue to crank engine until the flywheel mark is in the center of the peephole. Loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. With correct setting the backlash of the gears should be sufficient to open and close contacts. If ignition switch is turned on the ammeter will swing from '0' to 'Discharge' as the gears are rocked. Check the synchronization of the contacts to make certain that they open at the same instant.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches; stem diameter, .371 inch; valve length, 5 23/32 inches (over all). Valve lift, 5/16 inch. Tapet clearance, .004-.008 inch (hot). Spring pressure, 75 pounds (valve open). Inlet valves open at top dead center and close 48 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 17/32 inches; stem diameter, .370 inch; valve length, 5 23/32 inches (over all). Valve lift, 5/16 inch. Tappet clearance, .004-.008 inch (hot). Spring pressure, 75 pounds (valve open). Exhaust valves open 50 degrees before lower dead center and close 6 degrees after top dead center.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Model SB Type 6404. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 165-180 amperes at 5.5 volts. Brush spring tension is 3 pounds. Starter switch mounted on floorboard is Type 20238.

8.25 "	600	4.5	320
11.9 "	300	4.0	425
16 "	Lock	3.1	550

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing by standard S.A.E. No. 1 flange mounting. To remove starter, disconnect cable and remove three flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model LB Type 6390-A. The direction of rotation is counter-clockwise, looking at commutator end. Generator current regulation is by third brush shunt field. To adjust charging rate, turn the slotted adjusting pinion extending through the generator end plate. Turn the pinion in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush mounting plate is held in position by friction washers. The standard charging rate is 14 amperes (hot) reached at 1400 R.P.M. or 25-30 M.P.H.

Generator Data

Cold Test		Hot Test	
Amperes	R.P.M.	Amperes	R.P.M.

14.5	2000	12	2000
12	2400	10.5	2400

Brush spring tension is 12-16 ounces. Shunt field current is 8 amperes at 6 volts. Running as a motor, generator draws 12 amperes at 6 volts. A 6-ampere field fuse is mounted on the top of the generator.

Mounting:—Generator is flange mounted on the right of the engine at the rear of the timing chain case. To remove generator, disconnect lead and remove three flange mounting cap screws. Then pull generator straight to the rear.

Adjustment of Timing Chain Tension. Timing chain is adjusted by shifting generator around the lower flange mounting screw as a pivot. To adjust chain, loosen cap screws and shift generator away from the engine until the timing chain hums when engine is running. Then back up generator until chain operates noiselessly and tighten the screws. The chain should be loose enough to run without noise.

Oiling:—Put a few drops of medium oil in the oiler at each end of the generator every 2000 miles.

RELAY:—Type 20220. Relay is mounted on top of the generator. Contacts close at 600 R.P.M. when generator voltage reaches 6.75 volts, and open when generator voltage drops to 5.75-6.0 volts with a discharge current of 1-2 amperes. Relay contacts separate .020-.025 inch. Air gap is .015 inch with contacts closed.

LIGHTING:—Dodge Brothers Switch. Lighting switch mounted on side of steering column. Head lights are 6-8 volt, 21-21 cp. double filament, Mazda No. 1110. Auxiliary head lights are 6-8 volt, 3 cp. Mazda No. 63. Stop light is 6-8 volt, 15 cp. Mazda No. 87. Dome light is 6-8 volt, 3 cp. Mazda No. 63. Dash and tail lights are 6-8 volt, 3 cp. Mazda No. 63.

FUSES:—Generator field fuse is 6 amperes capacity.

DURANT

STAR FOUR MODEL M-2 (1928) SERIAL NUMBERS 1000 UP AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-CVX-5X7, 6 volt, 11 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 96 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16.8 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model IG-4066. Coil is mounted on the generator at the right of the engine. Ignition current is $1\frac{1}{2}$ -2 amperes at 6 volts with engine running and $4\frac{1}{2}$ -5 amperes at 6 volts with engine stopped.

Distributor Model IGB-4010-A. Breaker contacts separate .020-.025 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is full automatic. Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 11 degrees (engine) reached at 2400 R.P.M. Breaker arm spring tension is 16-20 ounces.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect primary lead and remove head with cables intact. Then loosen clamp screw on side of shaft housing and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 13 degrees or four teeth on the flywheel before top dead center with the breaker assembly in the fully retarded position. To set timing, crank engine over until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until a point on the flywheel 4 teeth before the top dead center mark is opposite the indicator line directly over the crankshaft in the center of the engine. The piston will then be 13 degrees before top dead center in firing position. Loosen the clamp screw under the distributor housing and rotate distributor until contacts begin to open. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plug diameters are $\frac{7}{8}$ -18 S.A.E. Gaps are .025 inch.

VALVE TIMING:—**Specifications:**—Head diameter, $1\frac{1}{2}$ inches; stem diameter, .371 inch; stem length, $5\frac{1}{4}$ inches. Valve lift, $\frac{5}{16}$ inch. Spring pressure, $78\frac{1}{2}$ pounds (valve open). Tappet clearance, .006 inch (hot). Valve stem guides are removable. Oversize valve stems are made.

Timing:—Inlet valves open 4 degrees after top dead center and close 46 degrees after lower dead center. Exhaust valves open 41 degrees before lower dead center and close 1 degree after top dead center.

STARTER:—Model MZ-4012. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is $2\frac{1}{2}$ -3 pounds each.

Brush spring tension is 24-32 ounces. Generator motoring draws 4.7-5.7 amperes at 6 volts. Shunt field current is 4.2 amperes at 6 volts. A five ampere field fuse is mounted on top of the generator.

Mounting:—Generator is flange mounted on right of engine on rear of timing chain case. To remove generator, disconnect all ignition wiring or remove coil and distributor. Then remove flange mounting cap screws and pull generator to rear. Lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every 250 miles. Every 5000 miles remove the oilwell and clean out all old oil and grease. Refill with light oil. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model CB-4007. Relay is mounted on the generator. Relay closes at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Lighting Switch. Switch is mounted on the steering column. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 2800 R.P.M. A Shaler ignition lock is used.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect manual advance rod and remove head with cables intact. Then remove Shaler lock. Loosen clamp nut on side of shaft mounting and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor every 500 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Continue to crank engine until piston reaches top dead center when the dead center mark on the flywheel will be opposite the indicator on the flywheel case. Then loosen clamp screw on timing arm under distributor and rotate distributor until contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. metric. Gaps are .025 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 1/8 inches; stem diameter, .371 inch; stem length, 5 45/64 inches; valve lift, 5/16 inch. Spring pressure, 103 pounds (valve open). Tappet clearance, .008 inch (hot). Valve stem guides are removable. Oversize valve stems are not made.

Timing:—Inlet valves open 5 degrees after top dead center and close 45 degrees after lower dead center. Exhaust valves open 40 degrees before lower dead center and close 5 degrees after top dead center.

STARTER:—Model MAD-4101. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 1 3/4-2 1/4 pounds.

DURANT

MODEL 75 (1928) SERIAL NUMBERS 1000 UP
CONTINENTAL 15U ENGINE
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted on right of engine on forward side of flywheel case. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAK-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction between the mounting stud and the end plate. Maximum charging rate is 16 amperes at 8 volts reached at 1550 R.P.M. or 23-30 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.6	560
6	6.9	675
10	7.3	875
14	7.65	1000
16.8	8.0	1525
14	6.65	2025

Brush spring tension is 24-32 ounces. Generator motoring draws 6 amperes at 6 volts. Shunt field current is 4.5 amperes at 6 volts. No field fuse is used.

Mounting:—Generator is flange mounted on right of engine on rear of timing chain case. To remove generator, disconnect all ignition wiring or remove coil and distributor. Then disconnect water pump drive coupling and take out flange mounting cap screws. Pull generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every 500 miles.

RELAY:—Model CB-4007. Relay is mounted on the generator. Contacts close at 11 M.P.H. or 550 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Lighting Switch. Lighting switch is mounted on the instrument board. A Delco-Remy dimmer switch mounted on the toeboard is used to control the head lights. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Auxiliary head lights (or side lights when used) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse on switch is 20 amperes capacity.

 American Model (1928)
 Delco-Remy System
 Plate No. 1325

ERSKINE

MODEL 51 (1928)
SERIAL NUMBERS 5,025,001 UP
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type WR-13, 6 volt, 13 plate. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Plates are 5 3/4 inches wide, 4 3/4 inches high, 3/32 inch thick. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 525-A. Coil is mounted on the generator. Ignition current is 1/2-2 amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped.

Distributor Model 639-R. Breaker contacts separate .020-.025 inch. Adjust contact opening by loosening locknut directly back of stationary contact and turning eccentric adjusting screw to secure proper setting. The stationary contact is mounted on a movable plate and moves so that contact surfaces are always parallel. Resurface contacts with a fine flat contact file or on a medium hard oil-stone. Breaker arm spring tension is 14-16 ounces. Distributor is semi-automatic. Maximum manual advance is 15° (engine). Automatic advance starts at 600 R.P.M. of engine. Maximum automatic advance is 24° reached at 3100 R.P.M.

Mounting:—Distributor is mounted on the rear of the generator at the right of the engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen the clamp screw in the distributor shaft housing and lift the distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium cup grease and turn down two turns every 1000 miles. At the same time remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the distributor shaft.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 7 1/2 degrees after top dead center measured on the flywheel with manual spark lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Continue to crank engine until piston reaches top dead center. This can be determined by removing plug in cylinder head directly over piston No. 6 and inserting rod or long wire to gauge piston travel. Piston No. 6 and No. 1 reach top dead center at the same instant. Then advance spark lever exactly one half. Breaker contacts should begin to separate at this point. If they do not, loosen clamp screw in advance arm and rotate distributor until contacts separate. Tighten the clamp screw. Connect the segment directly opposite rotor to spark plug in cylinder No. 1 and connect remaining plugs in order 5-3-6-2-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 3/8 inches; stem diameter, 5/16 inch; valve lift, 5/16 inch. Tappet clearance, .006 inch (hot). Inlet valves open 5° after top dead center and close 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 5/16 inch; valve lift, 5/16 inch. Tappet clearance, .006 inch (hot). Exhaust valves open 45° before lower dead center and close 12° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 712-H. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine drawing 305 amperes at 4.5 volts. Brush spring tension is 20-28 ounces.

 DELCO-REMY GENERATING, STARTING SYSTEM
 DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove one bolt and two flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 940-G. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen small round headed screw on generator end plate and remove commutator cover band. Then shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 16 amperes (cold) or 12 amperes (hot) reached at 1700 R.P.M. or 24 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
6	7.0	800	2.5	6.7	800
15.5	8.0	1700	12.0	7.7	1700
10	7.4	2800	9.4	7.4	2400

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 12-16 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect all ignition wiring or remove distributor and coil. Then back off chain adjustment screw and remove two flange mounting cap screws. Pull generator to rear, being careful not to disturb timing chain mesh on sprockets.

Adjustment of Timing Chain Tension:—Timing Chain tension is adjusted by shifting generator around lower flange mounting cap screw as a pivot. To adjust chain, loosen both flange mounting cap screws and turn up on adjusting screw until chain begins to hum with engine running. Then back off adjusting screw until chain runs noiselessly and tighten flange cap screws. Be careful not to get the chain too tight. With proper tension the chain will run without noise.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the commutator end of the generator every 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 12 M.P.H. or 800 R.P.M. when the generator voltage reaches 7-7.5 volts and opens at 9 M.P.H. or 600 R.P.M. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 484-E. Switch is mounted on lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament, double contact base using second filament instead of dimming) Mazda No. 1110. Parking lights (in head lamps) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and dome lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse on front of dash is 20 amperes capacity.

FALCON KNIGHT

MODEL 12 (1928) SERIAL NUMBERS 12000 UP AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

FALCON KNIGHT

Model 12 (1928)
Auto-Lite System

Plate No. 1326

BATTERY:—U.S.L., Type 3-HVX-7X, 6 volt, 15 plates. Starting capacity (20 minute rate) is 148.5 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 28.4 hours. The negative (—) terminal is grounded. Battery is mounted under the front floor board on the left side.

IGNITION:—Coil Model IG-4065. Coil is mounted on right side of engine at rear of distributor. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGA-4021. Breaker contacts separate .020-.024 inch. Re-surface contacts on a medium hard oilstone or with a fine flat contact file. Breaker arm spring tension is 20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 800 R.P.M. (engine). Maximum automatic advance is 20 degrees (engine) reached at 2400 R.P.M.

Mounting:—Ignition coil is grounded through case and all paint and grease must be kept from inside the strap mounting. Distributor is mounted on right side of engine block at forward end of engine. To remove distributor, disconnect manual advance rod and all distributor wires or remove distributor head. Then remove two mounting cap screws and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing with pure vaseline and turn down one turn each week or every 250 miles. Every 5000 miles remove the rotor button and saturate the wick oiler with light engine oil. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .023 inch before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke. This may be determined by removing all spark plugs except No. 1 and cranking engine until compression is felt. Continue to crank engine until piston is .023 inch before top dead center. This may be checked by removing clutch inspection plate. The flywheel mark 'IGN' should be opposite the pointer on the flywheel case. This mark is 8 degrees or 51/64 inch before top dead center. The allowable variation is 1 degree or 3/32 inch measured on the flywheel. Then loosen distributor clamp screw under distributor cup and rotate distributor cup until the contacts begin to separate. Tighten the clamp screw. Connect segment opposite rotor to spark plug in cylinder No. 1 and connect remaining plugs in order 5-3-6-2-4 counter-clockwise around head.

VALVE TIMING:—The Falcon Knight engine is of the sleeve valve type. Intake ports open 10 degrees or 1 inch on flywheel past top dead center with piston .035 inch down on intake stroke and close 35 degrees or 5 inches on flywheel past lower dead center with piston .277 inch up on compression stroke. Exhaust valves open 50 degrees or 5 inches on flywheel before lower dead center with piston on power stroke and close 5 degrees or 1/2 inch on flywheel after top dead center with piston .009 inch down on intake stroke.

Adjustment:—To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold opposite No. 6 cylinder and scrape carbon from edges of sleeve ports so that the closing of ports can be checked. Then remove clutch inspection plate and crank engine until mark 'EC' on the flywheel is opposite the pointer on the flywheel case. Place electric lamp over spark plug port in cylinder No. 6 and rotate eccentric shaft in a clockwise direction until the upper edge of the port in the outside sleeve passes the lower edge of the port in the cylinder block on the downward stroke. At this point the ray of light from the lamp will be cut off. Then assemble chain on crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in chain and change mesh of sprocket in chain until the five cap screws can be inserted without changing the positions of the eccentric shaft or crankshaft. Then tighten the five cap screws thus mounting the eccentric shaft sprocket on the eccentric shaft. To set tension of timing

Continued on reverse side.

Continued from preceding page.

chain, turn idler eccentric bushing spring until all slackness is removed from chain. Then give spring one complete turn and insert end in slot of idler stud.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MAB-4002. Starter is connected to the engine through a Bendix outboard drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 200 R.P.M. drawing 100 amperes at 5.5 volts. Starter switch is Model SW-4001. Starter brush tension is $1\frac{3}{4}$ -2 $\frac{1}{4}$ pounds each.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24.0 "	Lock	4	725

Mounting:—Starter is sleeve mounted at rear of flywheel case at right side of transmission case. To remove starter, remove front floor boards and disconnect starter cable. Then remove large pilot mounting screw and slide starter to rear. Lift from place.

Oiling:—Put 7 or 8 drops of light engine oil in each of the starter bearing oilers every two weeks or each 500 miles.

GENERATOR:—Model GYA-4202-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by tapping the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any desired position by friction between the third brush mounting bracket and the generator end plate. The maximum charging rate is 19 amperes (cold) at 8 volts.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2	6.6	620	2		700

Production Started October 2, 1927

OWEN-DYNETO GENERATING, STARTING SYSTEM NORTH EAST IGNITION

BATTERY:—Willard, Type CRR-19, 6 volts, 19 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 146 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 27 hours. Battery is mounted under the right front seat.

IGNITION:—Coil Type 18232. Coil is mounted on the right side of the engine on the crankcase. Ignition current is $1\frac{1}{2}$ amperes at 6 volts with engine running and $5\frac{1}{4}$ amperes at 6 volts with engine stopped.

Distributor Model TU Type 10770. Breaker contacts separate .020 inch with breaker arm on lobe of cam. Adjust contact gap by loosening lock screw on stationary contact stud and turning up stud until proper gap is secured. Breaker arm spring tension is 18 ounces. Condenser is mounted on breaker plate. Distributor is semi-automatic. Manual advance is 20 degrees (engine). Automatic advance begins at 250 R.P.M. of engine. Maximum automatic advance is 42 degrees reached at 2175 R.P.M.

Mounting:—Distributor is mounted at right of engine on crankcase. The lead from the ignition switch to the breaker is carried in a steel cable and this must be disconnected at the switch before the distributor can be taken off. Then disconnect manual advance rod and remove head with cables intact. Remove set screw from side of shaft housing and lift distributor housing from place. To remove breaker box, remove wax over two screws holding breaker box in housing, take out screws and lift breaker box out. This is necessary to remove either contacts or condenser as leads are fastened to binding post under the breaker box. The binding post nut cannot be reached until the breaker box has been removed.

Oiling:—Put 4 or 5 drops of light oil in oiler on side of distributor housing every 1000 miles. Every 2000 miles remove distributor head and rotor and put a few drops of oil in the wick-oiler in the center of the shaft.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one inch (on the flywheel) before top dead center with the spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Continue to crank engine until piston is one inch before top dead center when the mark '1-6' on the clutch ring will be one inch before the mark on the clutch housing. The triangular mark on the fan wheel at the front of the engine will be one inch before (or to the left, viewed from the front) the center line on the front of the fan wheel housing. Then loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. Connect the segment directly over the rotor with the spark plug in cylinder No. 1 and connect remaining spark plugs in order 4-2-6-3-5 clockwise around the distributor head. With correct setting the backlash of the gears should be sufficient to open and close contacts. Rock distributor shaft back and forth and watch dash ammeter. It should swing between '0' and 'Discharge'.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are special Champion 'Franklin'. Gaps are .031 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, $1\frac{9}{16}$ inches; stem diameter, .338 inch; stem length, $4\frac{13}{16}$ inches. Valve lift, $5\frac{1}{16}$ inch. Spring pressure, 32-34 pounds. Tappet clearance, .010 inch (cold). Inlet valves open at top dead center and close 57 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.5 inches; stem diameter, .338 inch; stem length, $4\frac{13}{16}$ inches. Valve lift, $5\frac{1}{16}$ inch. Spring pressure, 32-34 pounds. Tappet clearance, .010 inch (cold). Exhaust valves open $43\frac{1}{2}$ degrees before lower dead center and close 25 degrees after top dead center. Valve stems guides are removable. Oversize valve stems are not made.

STARTER:—Model DH-696. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125 R.P.M. drawing 155 amperes at 5.5 volts. Brush spring tension is $3\frac{1}{4}$ pounds each.

Continued on reverse side.

OWEN-DYNETO GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

Continued from preceding page.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	6	50
2.3 "	1000	5.4	170
5 "	690	5.1	225
11 "	400	4.3	390
25 "	Lock	3.5	620

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel case. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model CD-788. Generator is a four pole straight shunt field generator with third brush control. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, turn slotted screw on generator frame to shift third brush. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. It is not necessary to remove cover to change charging rate. With standard car setting, the maximum charging rate is 15 amperes at 8 volts reached at 1100 R.P.M. or 20 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
0	6.4	450
9	7.2	750
15	8.0	1000
7	7.0	3500

Motoring generator draws 7 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 3 pounds. A five ampere field fuse is located on the commutator end plate of the generator. The generator drive end bearing is located in the engine.

Mounting:—Generator is mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Pry generator to the rear being careful not to disturb plate between generator and chain case which carries generator bearing and drive sprocket. If this is removed the timing of the valves will be disturbed. The generator must not be run on the test stand without bolting a special bearing on the drive end. This can be secured from the Owen-Dyneto Corporation and is their Part No. 22375.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the generator every month or each 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Relay is mounted on the generator. Relay contacts close at 8-10 M.P.H. or 450 R.P.M. when the generator voltage reaches 6.4 volts and open at 7.5-8 M.P.H. or 435 R.P.M. with a discharge current of .5 ampere. Charging current at closing of contacts is approximately 1 ampere. Relay contacts separate .025-.040 inch. Air gap is .010 inch with contacts closed.

LIGHTING:—Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Auxiliary head lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dome light is 6-8 volt, 3 cp. S.C. Mazda No. 63. Tail light is in series with one dash light. They are each 3-4 volt, 2 cp. S.C. Mazda No. 61. The remaining dash lights are 6-8 volt, 3 cp. S.C. Mazda No. 63.

Switches:—Lighting switch is Soreng-Manigold. It is mounted on the instrument board. A dimmer switch is mounted on the steering column.

FUSES:—All lighting fuses are 20 amperes capacity.

DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 615-JFK, 6 volt, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on frame under right front floor boards.

IGNITION:—Coil Model 550-A. Ignition current is .6-2.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped. Coil is mounted on the back of the instrument board with the switch extending through to the driving compartment.

Distributor Model 658-B. Breaker contacts separate .022 inch with breaker arm on lobe of cam. Set contact gap by loosening lock screw on stationary contact plate and turning eccentric adjusting screw until proper setting is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Breaker uses two sets of contacts on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Gardner engine and breaker must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 500 R.P.M. and reaches a maximum of 17.5 degrees (engine) at 2000 R.P.M.

Mounting:—Distributor is mounted in well on top of cylinder head. To remove distributor, disconnect manual advance rod and breaker lead. Remove distributor head with cables in place. Remove manual advance stop screw and lift distributor out.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor and saturate the wick oiler in the center of the shaft with light engine oil. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 820738, and follow directions on Page S-2 of Reed Service Manual. Contacts can be synchronized without tool after distributor has been timed to engine by cranking engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach firing position. The second set of contacts should separate at this point. If they do not, loosen lock screws and turn eccentric adjusting screw on breaker plate until contacts begin to open. Tighten the lock screws and check the contact gap with the breaker arm on the lobe of the cam. If it is not within the limits of .018-.024 inch reset at .022 inch and repeat synchronization operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 6 degrees (on the flywheel) before top dead center with the spark lever fully advanced. To set timing, crank engine over until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark lever. Continue to crank engine until a point approximately 1.6 teeth on flywheel before top dead center mark is opposite the indicator on the flywheel case. Then loosen clamp screw on advance arm and rotate distributor until one set of contacts open. Tighten clamp screw and connect segment opposite rotor to spark plug in cylinder No. 1. Connect remaining plugs in order 6-2-5-8-3-7-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8 18 S.A.E. Standard. Gaps are .030 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 3/8 inches; stem diameter, 11/32 inch; stem length, 5 7/8 inches. Tappet clearance, .006 inch (hot). Spring pressure, 50 pounds closed. Valve lift, 11/32 inch. Intake opens at top dead center and closes 45 degrees past lower dead center.

Continued on reverse side.

GARDNER

MODEL 75 (1928) LYCOMING GT ENGINE

SERIAL NUMBERS 5AD62 UP

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

EXHAUST VALVES:—Head diameter, $1\frac{1}{4}$ inches; stem diameter, $11\frac{1}{32}$ inch; stem length, $5\frac{7}{8}$ inches. Tappet clearance, .008 inch (hot). Spring pressure, 50 pounds (closed). Valve lift, $11\frac{1}{32}$ inch. Exhaust opens at 50 degrees before lower dead center and closes at 10 degrees after top dead center. The stem guides are removable. Oversize valve stems are made.

STARTER:—Model 716-A. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension should be 24-28 ounces. Starter switch is Model 406-D.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3000	5	70
15 " "	Lock	3.7	450

Mounting:—Starter is flange mounted at left of engine on the forward side of the flywheel housing. To remove starter, disconnect cable and starting pedal rod. Then remove 3 cap screws on flange. Lift starter forward and out.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the starter every 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 949-C. The direction of rotation of the generator is counter-clockwise, looking at the commutator end. Current regulation is by the third brush system, combined with a thermostat. The thermostat contacts open at 150 degrees F. To adjust the generator output, loosen the screw on the generator end plate and shift the third brush mounting plate in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Generator motoring draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Generator brush spring tension is 24-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, loosen mounting bracket screws; push generator and water pump towards crank case, pry off belt. Remove water connections to pump, take out generator mounting screws, lift out generator and pump assembly. Radiator must be drained before the pump can be removed.

Oiling:—Put 4 or 5 drops of light engine oil in the generator oiler every 1000 miles.

RELAY:—Model No. 265-B. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. of the generator armature or 6-7 miles per hour with a generator voltage of 6.57 volts. Contacts open with a discharge current of 2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Lighting Switch Model 420-Q. Switch is mounted on the lower end of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using 21 cp. filament instead of dimming) Mazda No. 1110. Parking lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Side lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 3 cp. D.C. Mazda No. 64.

FUSES:—There are five 10 ampere fuses mounted on the lighting switch.

GARDNER

BATTERY:—Prest-O-Lite, Type 615-JFK, 6 volt, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted on frame under right front floor boards.

IGNITION:—Coil Model 550-A. Ignition current is .6-2.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped. Coil is mounted on the back of the instrument board with the switch extending through to the driving compartment.

Distributor Model 658-B. Breaker contacts separate .022 inch with breaker arm on lobe of cam. Set contact gap by loosening lock screw on stationary contact plate and turning eccentric adjusting screw until proper setting is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Breaker uses two sets of contacts on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Gardner engine and breaker must be accurately set. See Timing. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 500 R.P.M. and reaches a maximum of 17.5 degrees (engine) at 2000 R.P.M.

Mounting:—Distributor is mounted in well on top of cylinder head. To remove distributor, disconnect manual advance rod and breaker lead. Remove distributor head with cables in place. Remove manual advance stop screw and lift distributor out.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the rotor and saturate the wick oiler in the center of the shaft with light engine oil. Place a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

BATTERY:—Willard Type WR-13, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the front floor boards on the right frame member.

IGNITION:—Coil Type 20285. Coil is mounted on the dash integral with the ignition switch and lock which extends through to the driving compartment. Ignition current is 2 amperes at 7 volts with engine running and 5.5 amperes with engine stopped.

Distributor Type 10827. Breaker contacts separate .020 inch with breaker arm on lobe of cam. Set contact gap by loosening lock nut on stationary contact stud and turning stud until proper gap is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-18 ounces. Distributor is full automatic. Automatic advance begins at 750 R.P.M. of engine. Maximum automatic advance is 15 degrees reached at 2400 R.P.M. A spark control button is provided to secure additional retard.

Mounting:—Distributor is mounted on cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and remove head with cables intact. Then remove set screw in side of shaft mounting and lift distributor from place.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler on the side of the distributor every 1000 miles.

Timing:—Breaker contacts begin to separate when piston No. 1 entering power stroke reaches a position 7° or 47/64 inch on the flywheel before top dead center when the flywheel mark 'Spark Full Advance' is opposite the pointer on the flywheel case with the spark control button in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Then place spark button in advanced position. Continue to crank engine until flywheel mark 'Spark Full Advance' is visible through the peephole in the front of the flywheel housing on the right side directly opposite the indicator on the housing. Then loosen advance arm clamp screw and rotate distributor in a counter-clockwise direction until the contacts begin to separate. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

VALVE TIMING:—Inlet valves open at top dead center and close 40 degrees after lower dead center with piston 13/32 inch up on compression stroke or 4 15/64 inches on the flywheel past lower dead center. Exhaust valves open 40 degrees before lower dead center with piston 13/32 inch from bottom of power stroke or 4 15/64 inches on the flywheel before lower dead center and close 10 degrees after top dead center with the piston 3/64 inch down on intake stroke or 1 1/16 inches on the flywheel after top dead center. Tappet clearance should be .008 inch on inlet valves and .010 inch for exhaust valves. Flywheel distances are correct with 12 1/8-inch flywheel.

STARTER:—Type 6470. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Type 15380. Starter brush spring tension should be 37 ounces (2 pounds 5 ounces each).

Continued on reverse side.

Starter Data

Torque	R.P.M.	Volts	Amperes
4.3 lb. ft.	1000	4.6	280
6.5 "	600	4.1	370
8.5 "	300	3.75	445
10.5 "	Lock	3.2	545

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing by standard S.A.E. No. 1 flange. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Type 6472. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, shift third brush by turning knurled screw on generator end plate. Turn the screw in a clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With standard car setting the maximum charging rate is 13 amperes (hot) at 8 volts reached at 1300 R.P.M. or 25 miles per hour.

Generator Data (Cold)

Amperes	Volts	R.P.M.
3	8	700
13.5	8	1000
16	8	1200
17.25	8	1400
16.25	8	1800
15.5	8	2000

Motoring generator draws 4.5 amperes at 6.2 volts. Shunt field current is 4 amperes at 8 volts with generator running at 1300 R.P.M. (cold). Brush spring tension is 18 ounces. A 6 ampere field fuse is mounted in the commutator end plate.

Mounting:—Generator is cradle mounted at rear of engine on right side and is driven by extension of water pump shaft. To remove generator, disconnect lead and hose coupling. Then loosen clamp and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every 1000 miles.

RELAY:—Type 20220. Relay is mounted on the generator. Relay closes when the voltage of the generator reaches 7.25 volts and opens with a discharge current of 1-2 amperes. Charging current at closing of contacts is 2 amperes. Relay contacts separate .016 inch. Air gap is .028 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Auxiliary head lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 6 amperes capacity.

CIRCUIT BREAKER:—Delco-Remy Model 410-A. A vibrating circuit breaker is mounted on the dash. Circuit breaker begins to operate when the current reaches 25-30 amperes. While vibrating it limits the current to 15 amperes.

BATTERY:—Willard, Type CWR-17, 6 volt, 17 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 23 hours. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Type 20232. Coil is mounted on the toeboard. Ignition current is 2 amperes at 7 volts with engine running and 5.5 amperes with engine stopped.

Distributor Type 10833. Breaker contacts separate .020 inch. Set contact gap by loosening locknut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-18 ounces. Breaker has two sets of contacts opening at the same instant. They must be synchronized (see Timing). Distributor is full automatic with an auxiliary spark control button to provide retard. Automatic advance begins at 750 R.P.M. of engine. Maximum automatic advance is 15 degrees reached at 2400 R.P.M.

Mounting:—Distributor is mounted on cylinder head and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then remove set screw in side of distributor shaft housing and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor shaft every 1000 miles.

Timing:—Synchronization of Contacts:—Connect a six volt lamp across each of the breaker contacts. Watch lights as contacts open. Both lamps should light at the same instant.

Timing Distributor to Engine:—Breaker contacts separate when piston No. 1 entering power stroke reaches a position when the flywheel mark 'Spark Full Advance' is opposite the indicator on the flywheel housing. To set timing, crank engine until piston No. 1 enters compression stroke. Place spark control button in fully advanced position and see that distributor is turned counter-clockwise to the full limit of the advance arm slot. Then continue to crank engine until flywheel mark 'Spark Full Advance' is opposite the indicator in the peephole on the forward side of the flywheel housing on the right side of the engine. Loosen advance arm clamp bolt and rotate distributor until contacts begin to open. Tighten the clamp bolt and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect remaining plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .028-.030 inch.

VALVE TIMING:—Inlet valves open at top dead center and close 45 degrees after lower dead center with the piston 37/64 inch up on compression stroke or 6 15/64 inches on the flywheel past lower dead center. Exhaust valves open 50 degrees before lower dead center with the piston 23/32 inch from bottom of power stroke or 6 59/64 inches on the flywheel before lower dead center and close 10 degrees after top dead center with the piston 3/64 inch down on intake stroke or 1 25/64 inches on the flywheel past top dead center. Flywheel distances are correct with standard 15 7/8-inch flywheel. Valve lift is 11/32 inch. Tappet clearance is .010 inch.

STARTER:—Type 6462. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2 pounds 5 ounces (37 ounces). Starter switch is Type 15380.

Continued on reverse side.

MODELS 619 AND 629 (1928)
NORTH EAST GENERATING, STARTING SYSTEM
NORTH EAST IGNITION

Continued from preceding page.

Starter Data			
Torque	R.P.M.	Volts	Amperes
5 lb. ft.	1000	5.0	230
8.25 "	600	4.5	320
11.75 "	300	4.0	425
13 "	200	3.8	470
16 "	Lock	3.1	550

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing by standard S.A.E. No. 1 flange. To remove starter, disconnect cable and remove 3 flange mounting bolts. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Type 6447. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, shift third brush by turning knurled screw on commutator end plate. Turn screw in a counter-clockwise direction shifting third brush in a clockwise direction to increase charging rate and in the opposite direction to decrease charging rate. With standard car setting, maximum charging rate is 17.5 amperes (hot) reached at 1300 R.P.M. or 25 miles per hour.

Generator Data (Cold)

Amperes	Volts	R.P.M.
4	8	700
12	8	900
17.5	8	1200
17.5	8	1300
16.5	8	1600
14.25	8	2000

Motoring generator draws 5 amperes at 6.2 volts. Shunt field current is 6 amperes at 8 volts with generator running at 1300 R.P.M. Brush spring tension is 1 pound 2 ounces (18 ounces). A six ampere field fuse is mounted in the commutator end plate.

Mounting:—Generator is cradle mounted at left of engine and is driven by extension of water pump shaft. To remove generator, disconnect lead and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY:—Type 20220. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 7.25 volts and open with a discharge current of 1-2 amperes. Charging current at closing of contacts is 1.5-2 amperes. Relay contacts separate .016 inch. Air gap is .028 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Side lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dash, panel and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 6 amperes capacity.

CIRCUIT BREAKER:—Delco-Remy Model 410-A. A vibrating circuit breaker is mounted on the dash. Circuit breaker begins to operate with a current flow of 25-30 amperes and continues to vibrate limiting the current to 15 amperes until the short circuit is removed.

HUPMOBILE

MODEL A-6 'NEW CENTURY SIX' (1928) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Willard, Type CRR-15, 6 volt. Starting capacity (20 ampere rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery has 15 plates each 4 3/4 inches high, 5 3/4 inches wide and 3/32 inch thick. The positive (+) terminal is grounded. Battery is mounted under the front seat on the left side.

IGNITION:—Coil Model IG-4065. Ignition coil is mounted on the dash. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGC-4001. Breaker contacts separate .020-.024 inch. Resur-face contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension should be 16 ounces. Distributor is semi-automatic. Maximum manual advance is 15° (distributor). Automatic advance begins at 500 R.P.M. (distributor). Maximum automatic advance is 8° reached at 1800 R.P.M.

Mounting:—Distributor is mounted at left of engine by special flange. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with high tension cables intact. Then remove set screw on side of distributor mounting and lift distributor from place.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the side of the distributor ever 500 miles. Put a small amount of vaseline on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with manual spark lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully retard spark lever and continue to crank engine until piston reaches top dead center. Loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. Make certain that the rotor is opposite the segment connected to spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .022-.025 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 1/2 inches. Valve lift, 5/16 inch. Tappet clearance, .005 inch (inlet) and .006 inch (exhaust).

Timing:—Inlet valves open 4 degrees after top dead center and close 51 degrees after lower dead center. Exhaust valves open 47 degrees before lower dead center and close at top dead center.

STARTER:—Model MN-4109. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 1 1/4-1 1/2 pounds. Starter switch is Model SW-4002.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (No Bendix)

Continued from preceding page.

remove three flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every 1000 miles.

GENERATOR:—Model GAJ-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove cover band and shift third brush by pressure on mounting bracket. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in position by friction between the mounting bracket and the end plate. Maximum charging rate is 15 amperes (cold) reached at 1600 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	6.8	600			
12.8	7.6	1200			
15	8.0	1600	11.9	8.0	1900
13.4	7.8	2000			
11.7	7.5	2400			

Brush spring tension is $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds each. A five ampere field fuse is mounted on the generator.

Mounting:—Generator is mounted at right of engine on rear of timing chain case by standard S.A.E. flange mounting. To remove generator, disconnect generator wire and back off timing chain adjusting set screw. Then remove three flange mounting cap screws and pull generator to rear being careful not to disturb the timing chain.

Timing Chain Adjustment:—The tension of the timing chain is adjusted by shifting the generator around the lower flange mounting cap screw as a pivot. Loosen the flange cap screws and turn up the chain adjusting set screw until the chain begins to hum with the engine running. Then back off the set screw until the chain runs noiselessly. This will give the proper tension. Be careful not to get the chain too tight.

Oiling:—Put 4 or 5 drops of light oil in the generator oiler every 1000 miles.

RELAY:—Model CB-4012. Relay is mounted on the generator. Contacts close at 650 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Clum Switch Model 10612. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base) Mazda No. 1110. Stop and backing light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Parking lights (in head lamps) and side lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses on junction block are 15 amperes.

MODEL JE (1928) SERIAL NUMBERS 125001 UP AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Willard, Type CWR-15, 6 volt, 15 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 114 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the driver's seat.

IGNITION:—Coil Model IG-4078. Coil is mounted on the right frame member at the right of the engine. Ignition current is 1.2 amperes at 6.2 volts with engine running at 2200 R.P.M. and 4.8 amperes (cold) or 4.4 amperes (hot) at 6.2 volts with engine stopped.

Distributor Model IGD-4001:—Breaker contacts separate .018-.020 inch. To adjust contact gap, loosen lock screw and turn contact screw with a screwdriver. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-20 ounces at the contact points. Distributor is semi-automatic. Maximum manual advance is 25 degrees of distributor. Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 20 degrees (engine) reached at 3400 R.P.M.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables intact. Remove clamp screw from manual advance arm and lift distributor from place.

Oiling:—Put 8 or 10 drops of light oil in the oiler on the side of the distributor housing every 1000 miles. Put 5 drops of oil on the breaker arm pin every 500 miles. Every 3000 miles put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $1\frac{1}{2}$ inches (on the flywheel) before top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (this is the upstroke with both valves closed). Then fully advance spark lever and remove inspection hole cover on flywheel case. Continue to crank engine until flywheel mark 'IGN' is opposite indicator on flywheel case. This mark is $1\frac{1}{2}$ inches before the top dead center position. Then loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw. Connect the segment opposite the rotor to the spark plug in cylinder No. 1 and connect the remaining plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—Specifications:—Head diameter, $1\frac{1}{2}$ inches (inlet valves), $1\frac{3}{8}$ inches (exhaust valves); stem diameter, .3095-.3085 inch; length, $5\frac{61}{64}$ inches (from top of head to end). Valve lift, $\frac{5}{16}$ inch. Tappet clearance, .006-.004 inch (hot). Spring pressure, 61 pounds outer spring and 26 pounds inner spring or 87 pounds total. Valve stem guides are removable. Oversize valve stems are made.

Timing:—Inlet valves open 8 degrees past top dead center and close 40 degrees past lower dead center. Exhaust valves open 40 degrees before lower dead center and close 8 degrees past top dead center. Inlet opening and exhaust closing point is indicated by mark '#1-EX.CL'.

STARTER:—Model MUA-4003. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter switch is Model SW-3646. Brush spring tension is $1\frac{1}{2}$ pounds each.

MODEL JE (1928) SERIAL NUMBERS 125001 UP AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel case. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAG-4105. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by tapping on mounting stud with a screwdriver. Shift third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in any position by friction between the mounting stud and the end plate. The maximum charging rate is 18 amperes at 8 volts reached at 1400 R.P.M. or 23-24 miles per hour.

Generator Data		
Amperes	Volts	R.P.M.
0	6.4	475
4	6.75	575
8	7.1	700
12	7.45	850
16	7.8	1050
18	8.0	1300

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 4.5 amperes at 6 volts. Brush spring tension is 22-28 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect all ignition wiring or remove distributor. Then disconnect generator lead and remove three nuts from flange mounting bolts. Slide generator to rear and lift from place. Be careful not to disturb timing chain.

Oiling:—Put 4 or 5 drops of light oil in each of the generator oilers every 500 miles.

RELAY:—Model CB-4012. Relay is mounted on the generator. Relay closes at 7-8 M.P.H. at 550 R.P.M. of armature when generator voltage reaches 6.5-7 volts and opens with a discharge current of $1\frac{1}{2}$ -2 $\frac{1}{2}$ amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .030 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Kellogg Switch Model 418. Switch is mounted on the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Auxiliary head lights (in head lamps) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 7.5 amperes capacity.

Model JE (1928) .
Auto-Lite System

Plate No. 1334A

JORDAN

CROSS COUNTRY SIX MODEL RE (1928) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Willard, Type WR-13, 6 volt. Starting capacity is 98 amperes for 20 minutes. Lighting capacity is 5 amperes for 17 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model IG-4065. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGB-4011. Breaker contacts separate .020-.025 inch. Set contact opening by loosening lock nut on stationary contact stud and turning up stud until proper opening is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees. Automatic advance begins at 300 R.P.M. Maximum automatic advance is 15 degrees reached at 2800 R.P.M.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on top of the cylinder block and can be removed from the left side. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then remove screw from manual advance arm and lift distributor from place.

Oiling:—Put 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles. At the same time put 5 drops of oil in the oiler on the end of the breaker cam shaft in the distributor head. Every 3000 miles put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $1\frac{3}{8}$ inches before top dead center (on the flywheel) with the spark control lever in the fully advanced position. To set timing crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Make certain that the manual advance lever is in the fully advanced position. Then remove the clutch inspection plate and continue to crank engine until the mark 'IGN' on the flywheel is under the pointer stud in the flywheel case. This mark is $1\frac{3}{8}$ inches before the top dead center mark. The breaker contacts should begin to separate at this point. Loosen the manual advance arm clamp screw and rotate the distributor cup until the contacts begin to separate. Tighten the clamp screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, $1\frac{9}{16}$ inches; stem diameter, .34025-.33925 inch; valve length, $5\frac{11}{32}$ inches (from top of seat to end); valve lift, $\frac{5}{16}$ inch; spring pressure, 103 pounds; tappet clearance, .004-.006 inch (hot); inlet valves open 5° after top dead center and close 45° after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{7}{16}$ inches; stem diameter, .34025-.33925 inch; valve length, $5\frac{11}{32}$ inches (from top of seat to end); valve lift, $\frac{5}{16}$ inch; spring pressure, 103 pounds. Exhaust opens 40° before lower dead center and closes 5° after top dead center. This point is marked on the flywheel '1-EX-CL'. Valve stem guides are removable. Oversize valve stems are made on order.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are Champion No. 4. Gaps are .030 inch.

STARTER:—Model MN-4124. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush tension is $1\frac{1}{4}$ - $1\frac{1}{2}$ pounds each. Starter switch is Model SW-4002.

Continued on reverse side.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAG-4110. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any position by friction between the mounting stud and the end plate. The maximum charging rate is 16 amperes at 8 volts reached at 1350 R.P.M. or 23 miles per hour.

Amperes	Volts	R.P.M.
2	6.6	525
6	6.9	625
10	7.3	735
14	7.65	900
17	8.0	1350
12	7.45	2125

Brush spring tension is 24-32 ounces. Generator motoring draws 4.75-5.25 amperes at 6 volts. Shunt field current is 3.9-4.4 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and loosen chain adjustment jamb nut and adjusting screw on side of generator flange. Then remove two flange mounting cap screws and slide generator to the rear.

Oiling:—Put 5 or 6 drops of light engine oil in the oiler at each of the generator every 1000 miles.

RELAY:—Model CB-4011. Relay is mounted on top of the generator. Relay closes at 620-690 R.P.M. when the generator voltage reaches 7-7.5 volts, and open with a discharge current of $1\frac{1}{2}$ -2 $\frac{1}{2}$ amperes each. Charging current is 2 amperes at closing of contacts. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Kellogg Switch Model 409. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Auxiliary head lights (or side lights used as optional equipment) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the dash. It protects the lighting circuits.

DELCO-REMY IGNITION

KLEIBER

Model 80 (1924-28)
Delco-Remy System

Plate No. 1336

BATTERY:—Prest-O-Lite, Type 613-SHK, 6 volt. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. The positive (+) terminal is grounded. Battery is mounted under the driver's seat on left side.

IGNITION:—Coil Model 2178. Distributor Model 5256 (1924) 5257 (1925-26-27-28). Breaker contacts separate .020-.025 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 30°. Automatic advance begins at 600 R.P.M. Maximum automatic advance is 17-21° at 2000 R.P.M. Breaker arm spring tension is 13-16 ounces.

Mounting:—Ignition coil is mounted on the engine side of the dash. Distributor is mounted at front of engine between timing gear case and pump. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables attached. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every two weeks or each 500 miles. Every month put a small bit of heavy grease on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 5° (on the flywheel) past top dead center with the manual advance lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. Then loosen advance lever clamp screw and rotate distributor cup until contacts begin to separate. Tighten the clamp screw and make certain that rotor is under segment connected to spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .022 inch.

STARTER:—Model 181 (1924) 339 (1925-26-27-28). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125 R.P.M. drawing 80 amperes at 4.5 volts. Starter switch is Model 1953. Brush spring tension is 2 1/4-2 1/2 pounds each.

Starter Data (Model 181)

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	36
27 "	Lock	2.75	500

Starter Data (Model 339)

Torque	R.P.M.	Volts	Amperes
4.5 lb. ft.	700	5	200
19 "	Lock	3	500

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel case. To remove starter, disconnect cable and remove large pilot set screw from flywheel case directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in starter oilers every month or each 1000 miles. Every six months remove grease plug in reduction gear case and repack gears with medium heavy cup grease. Once each year withdraw starter from mounting and saturate wick oiler in end of Bendix gear case.

Continued on reverse side.

KLEIBER**TOURING MODEL 80 (1924-1928)****SERIAL NUMBERS 1001 UP****DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM****DELCO-REMY IGNITION**

Continued from preceding page.

GENERATOR:—Model 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen commutator cover band and shift third brush mounting bracket by means of the handle on the mounting plate. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any position by friction clamp washers. Maximum charging rate is 15-17 amperes at 8 volts reached at 1600 R.P.M.

Generator Data	
Amperes	R.P.M.
0	300
4	800
15-17	1600

Running as a motor, generator draws 5 amperes at 6 volts. Shunt field current is 3 amperes at 6 volts. Brush spring tension is $1\frac{1}{4}$ - $1\frac{3}{4}$ pounds each.

Mounting:—Generator is mounted at left of engine and is driven by extension of water pump shaft. To remove generator, disconnect lead and flexible hose coupling. Then remove four base mounting bolts and lift generator from place.

Oiling:—Put 8 to 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay is mounted on the generator. Relay closes at 300 R.P.M. when the generator voltage reaches 6.75-7.5 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 1244. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dome, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dimming is through resistance on switch.

CIRCUIT BREAKER:—A vibrating circuit breaker on the back of the switch protects the lighting circuits. Circuit breaker begins to vibrate with a current of 25-30 amperes and limits the current to 10-15 amperes.

NEW SEDAN MODEL (1928)

CONTINENTAL 15-S ENGINE

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

KLEIBER

New Model (1928)
Delco-Remy System

Plate No. 1337

BATTERY:—Prest-O-Lite 613-SHK, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 130 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22.5 hours. Battery is mounted on the left side under the driver's seat.

IGNITION:—Coil Model 525-C. Ignition coil is mounted on the generator at right of engine. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-H. Breaker contacts separate .022 inch. Set contact gap by loosening the lock nut on stationary contact plate and turning eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. There are two sets of breaker contacts on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Kleiber engine and contacts must be synchronized to secure correct ignition performance. See Timing. Distributor is semi-automatic. Maximum manual advance is 22 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees at 3200 R.P.M.

Mounting:—Distributor is mounted at right of engine on rear of generator. To remove distributor, disconnect manual advance rod and primary lead. Remove head with cables intact. Then loosen mounting clamp directly under advance arm clamp screw and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head and turn down two turns every 1000 miles. Every 5000 miles remove the head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Put a small amount of heavy grease on the face of the breaker cam.

Timing:—Synchronization of Contacts. To synchronize contacts, use Delco-Remy Tool, Part No. 820738, and follow directions given on Page S-2 of Reed Service Manual. Contacts can be synchronized without tool after distributor has been timed to engine by turning over engine 90 degrees from firing position of piston No. 1 when piston No. 6 will read top dead center entering firing stroke. Make certain that manual spark control is fully retarded. If one set of breaker contacts are not separating, loosen lock screws on breaker plate and turn eccentric adjusting screw until contacts begin to separate. Tighten the lock screw and check contact gap. If it is outside limits of .018-.024 inch, reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Continue to crank engine until piston reaches top dead center. If one set of contacts is not opening, loosen advance arm clamp screw and rotate distributor until contacts open. Tighten the clamp screw. Connect the segment opposite the rotor to the spark plug in cylinder No. 1 and connect remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, $1\frac{3}{8}$ inches; stem diameter, $\frac{5}{16}$ inch; valve lift, $\frac{5}{16}$ inch. Tappet clearance, .004 inch (hot). Inlet valves open 8 degrees after top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1¼ inches; stem diameter, 5/16 inch; valve lift, 5/16 inch. Tappet clearance, .006 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 8 degrees after top dead center.

Continued on reverse side.

KLEIBER

NEW SEDAN MODEL (1928)
CONTINENTAL 15-S ENGINE
DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

STARTER:—Model 724-J. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces. Starter switch is Model 406-A.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter oiler every 1000 miles.

GENERATOR:—Model 940-K. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 20 amperes reached at 1450 R.P.M.

Generator Data					
Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
20	8.5	1450	9-12	7.5	2000

Generator motoring draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on the rear of timing chain case. To remove generator, take off ignition coil and distributor. Then loosen timing chain adjustment screw and take out 2 flange mounting cap screws. Pull generator to rear and lift from place, taking care not to disturb mesh of timing chain on generator sprocket.

Timing Chain Adjustment:—Timing chain tension is adjusted by shifting generator. To adjust chain, loosen the 2 flange mounting cap screws and turn up chain adjusting set screw on side of generator flange until chain begins to hum with engine running. Then back off adjusting set screw until noise stops and tighten flange mounting cap screws. With proper adjustment chain will run without noise.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 1244. Lighting switch is mounted on instrument board. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dome, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dimming is through resistance on switch.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the switch. It begins to vibrate when the current reaches 25-30 amperes and continues to operate limiting the current to 10-15 amperes until the cause of the excessive current flow is removed.

**KLEIBER**

New Model (1928)
 Delco-Remy System

Plate No. 1337A

LA SALLE

SERIES 303 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-XC-15-I-G, 6 volt. Starting capacity is 114 amperes for 20 minutes. Lighting capacity is 5 amperes for 20 hours. The positive (+) terminal is grounded. Battery is mounted under the front seat on the right side.

IGNITION:—Coil Model 2195. Distributor Model 4032. Breaker contacts separate .022-.027 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Manual advance is 38° (engine). Automatic advance begins at 600 R.P.M. (engine). Maximum automatic advance is 20° at 2800 R.P.M. Breaker arm spring tension is 16-20 ounces. There are two breakers on a four sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft rotation which is the correct firing interval for the La Salle engine. The firing interval must be accurately set (see Timing).

Mounting:—The ignition system is equipped with an Electrolock switch. This must be removed from the car with the distributor when the distributor is to be taken from its mounting. To remove distributor, disconnect manual advance rod and remove head with high tension cables attached. Then remove hold-down screw and lift unit from place. The distributor is mounted at the front of the engine between the cylinder banks. The coil is mounted on the side of the distributor support.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 822572, and follow directions on Page S-1. Synchronizing of contacts is important and synchronization must be checked whenever distributor timing is checked.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches a position $\frac{7}{8}$ inch on the flywheel before top dead center with the spark lever fully advanced. With piston No. 1R in firing position the flywheel mark 'IG/A-1-5' will be opposite the indicator on the flywheel case. This mark is $\frac{7}{8}$ inch before the top dead center mark. To set timing, crank engine over until piston No. 1 enters compression stroke (the up stroke with both valves closed). Fully advance spark lever. Continue to crank engine until the flywheel mark 'IG/A-1-5' is opposite the indicator on the case. If contacts do not separate at this point, loosen taper screw in center of breaker cam and rotate cam until contacts open. Tighten the screw. The second set of contacts will be open but just closing. They will break 45 degrees (distributor) after this point with the flywheel mark 'IG/A-2-6' opposite the indicator. These directions apply only to standard compression engines. For special direction on high compression engines see following paragraph.

Special Directions for Timing High Compression Engines:—On La Salle engines with high compression heads (with letters 'H.C.' cast in head) contacts separate with the piston entering power stroke $\frac{1}{2}$ inch on the flywheel before top dead center with the spark lever fully advanced. Crank engine over until a point on the flywheel approximately half way between the ignition mark 'IG/A-1-5' and the top dead center mark is opposite the indicator. Set distributor so one set of contacts is beginning to separate. With engines using high compression heads it is important that the spark plug gaps be set at .026 inch.

Valve Timing:—**INLET VALVES:**—Head diameter, $1\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, $6\frac{17}{64}$ inches; valve lift, $\frac{25}{64}$ inch; tappet clearance, .004 inch (cold); spring pressure, 133 pounds compressed to $2\frac{9}{64}$ inches. Inlet valves open $11^{\circ}2'$ before upper dead center and close $58^{\circ}38'$ after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{1}{2}$ inches; stem diameter, $\frac{3}{8}$ inch; stem

Continued on reverse side.

LA SALLE

SERIES 303 (1928)

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

length, $6\frac{1}{4}$ inches (over all); valve lift, $25/64$ inch; tappet clearance, .006 inch (cold); spring pressure, 133 pounds compressed to $2\frac{9}{64}$ inches. Exhaust valves open $38^{\circ}12'$ before lower dead center and close $7^{\circ}38'$ after upper dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is IL-4R-4L-2L-3R-2R-1R. No. 1 cylinder is nearest the radiator. Right hand block is right viewed from driver's seat.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Spark plug gaps on standard compression engines are .032 inch. On engines with high compression heads gaps must be set at .026 inch.

STARTER:—Model 725-C. Starter is connected to the engine through a mechanical gear shift connected to the starting pedal. The direction of rotation is clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	60
16 "	Lock	3	600

Mounting:—Starter is mounted on rear of flywheel housing on right side. To remove starter, disconnect cable and starter pedal linkage and remove three flange mounting capscrews. Then slide starter to rear and lift from place.

Oiling:—Starter is equipped with oilless bearings. They require no attention.

GENERATOR:—Model 384. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F . cutting a resistance in the field circuit and reducing the output approximately 40%. Generator output is adjusted by shifting the third brush. To make this adjustment, loosen the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by springs. The maximum charging rate is 18-20 amperes reached at 1600 R.P.M. or 22-25 M.P.H.

Generator Data

Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
18-20	8.6	1400	10-12	7.3-7.7	1600

Third brush shunt field draws 1.8-2.3 amperes at 6 volts. Brush spring tension is 16-20 ounces.

Mounting:—Generator is mounted at right of engine and is driven in tandem with water pump. To remove generator, disconnect battery wire and remove three mounting nuts. Then pull generator to rear.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 266-N. Relay is mounted on the generator. Relay closes at approximately 8 M.P.H. when the generator voltage reaches 7.75 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Lighting Switch Model 1313 is mounted at the foot of the steering column. Head lamps are 6-8 volt, 21 cp. double filament using lower 21 cp. filament instead of dimmers. Stop lamp is 6-8 volt, 21 cp. S.C. Side, dash, tail and dome lamps are each 6-8 volt, 3 cp S.C.

CIRCUIT BREAKER:—Model 5759. A combined vibrating and lockout circuit breaker is mounted on the dash. The vibrating circuit breaker protects the lighting circuits. It begins to operate with a current of 25-30 amperes and limits the current to 10-15 amperes. The lockout circuit breaker protects the horn, cigar lighter, and stop lamp circuits. It begins to operate at 25-30 amperes. Current while operating is less than 1 ampere.

LINCOLN

1928

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Exide, Type 3-LXRV-15-2, 6 volt, 135 ampere hour. The starting capacity (20 minute rate) is 137 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 2192. Distributor Model 5226. Breaker contacts separate .015-.020 inch. They are made of tungsten. When the condition of the contacts affects the ignition, remove and resurface on a medium hard oilstone. Two sets of contacts are used with a four sided cam. Contacts open alternately at intervals of 30 degrees and 60 degrees corresponding to 60 degrees and 120 degrees of crankshaft rotation. This is the correct firing interval for the Lincoln engine. Contacts must be synchronized (see Timing). Distributor is semi-automatic. Maximum manual advance is 18-23 degrees. Automatic advance begins at 900 R.P.M. and reaches a maximum of 24-28 degrees at 3000 R.P.M. Breaker arm spring tension is 16-20 ounces.

Oiling:—Put 3 or 4 drops of light engine oil in the oiler on the side of the distributor housing every 250 miles. Remove the grease plug and pack the gear case with light cup grease to a level just below the cover plate (located on the front of the unit near the spark control lever) every 5000 miles. Place a small amount of vaseline or heavy grease on the face of the breaker cam and in the distributor head every 1000 miles. Remove all excess and polish the rotor track with a soft clean cloth.

Mounting:—Distributor is mounted at the forward end of the engine. To remove, remove 4 hold-down screws and lift distributor upward and out from position.

Timing:—**Synchronization of Contacts:**—Use Delco-Remy Tool, Part No. 822570, and follow directions on Page S-2 to synchronize contacts. Connect a test lamp in each primary circuit to determine accurately when contacts open.

Timing Distributor:—Right hand breaker contacts begin to separate when piston No. 1R on compression stroke reaches a position at which the vertical mark preceding the marking 'RI' on the clutch ring is opposite the indicator with the spark control lever in the fully retarded position. This mark is $\frac{3}{8}$ inch past the 'T.D.C.' mark on the flywheel. This breaker controls the right hand coil and fires the four cylinders of the right hand block. To set timing, loosen lock screws in center of cam and rotate cam until right hand contacts separate. Use a test lamp connected in series with each primary circuit to determine this point. Then tighten lock screw. Connect spark plugs in order around distributor head as shown on diagram.

Firing Order:—The firing order is 1R-4L-2R-3L-4R-1L-3R-2L. Cylinder banks are right and left as viewed from driver's seat. No. 1 cylinder is nearest the radiator.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ inch. Gaps are .020-.025 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, $1\frac{7}{8}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, $6\frac{3}{4}$ inches. Tappet clearance, .003-.004 inch (cold). Spring pressure, 85 pounds. Valve lift, $\frac{5}{16}$ inch. Intake opens $2\frac{1}{2}$ degrees before top dead center and closes 46 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, $1\frac{3}{4}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, $6\frac{3}{4}$ inches. Tappet clearance, .003-.004 inch (cold). Spring pressure, 85 pounds. Valve lift, $\frac{5}{16}$ inch. Intake opens 48 degrees before lower dead center, and closes at top dead center. Valve stem guides are removable. Oversize valves are not made.

STARTER-GENERATOR:—Model 193. Starter and generator are combined into one unit. Starter is connected to the engine through a set of reduction gears meshed by the operator. Depressing the starter pedal meshes the gears, opens the generator circuit and brings the starter brushes in contact with the commutator, al-

LINCOLN
1928
Delco-Remy System

LINCOLN

1928

DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

lowing it to crank the engine. When the pedal is released, a spring reverses these operations. Two over-running clutches permit the high speed necessary in cranking the engine and prevent the engine driving the starter. The direction of rotation is counter-clockwise, looking at the starter commutator end. Starter brush tension should be $2\frac{1}{4}$ - $2\frac{3}{4}$ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	4000	6	60
10 "	Lock	3	60

GENERATOR:—Generator current regulation is by the third brush system. To adjust charging rate, loosen cover band on the generator end (front) of unit, exposing the brush regulating lever. Raising the lever increases the charging rate; lowering it decreases the charging rate. Replace the cover band after adjusting. A thermostat mounted with third brush opens at 195-200 degrees F. cutting down the output 30%. The brush tension should be $1\frac{1}{2}$ - $1\frac{3}{4}$ pounds each.

Generator Data

Amperes	R.P.M.
3	600
16-18	1400

Mounting:—Starter-generator is mounted at right of engine. To remove, drain radiator, disconnect pump shaft, and remove drip pan under starter-generator. Then remove all pump bolts and drop pump down past engine. Remove two cap screws extending through to back of crank case arm holding stater,generator to engine and remove unit by slipping it down past the engine.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter-generator oilers every 500 miles. Once each year, remove, disassemble and clean motor and generator clutches. Repack with vaseline.

RELAY:—No relay is used. Generator is connected to the battery through the ignition switch.

LIGHTING:—**Lincoln Make.** Lighting switch is mounted on steering wheel. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using 21 cp. filament instead of dimming) Mazda No. 1110. Auxiliary head lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and backing lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129.

CIRCUIT BREAKER:—**Model 5770.** Two circuit breakers are mounted on the rear of the dash. A vibrating circuit breaker opens when the current flow reaches 25-30 amperes and continues with a flow of 10-15 amperes. A lock-out circuit breaker operates when the current flow reaches 25-30 amperes and continues with less than 1 ampere.

MARMON
Model 68 (1928)
Delco-Remy System

Plate No. 1340

MARMON

MODEL 68 (1928)

DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 615JFK, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the driver's seat on the left side.

IGNITION:—Coil Model 525-C. Coil is mounted on the left side of the engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-C. Breaker contacts separate .022 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw until gap is .022 inch with breaker arm on lobe of cam. Breaker arm spring tension is 17-21 ounces. Breaker has two sets of contacts on a single four-sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Marmon engine and it must be accurately set. (See Timing.) Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 25 degrees reached at 2600 R.P.M. Total advance 45 degrees (engine).

Mounting:—Distributor is mounted on the top of the engine block. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with cables intact. Then remove manual advance stop screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head with medium cup grease and turn down one turn every 750 miles. Once each month remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light oil.

Timing:—**Synchronization of Contacts.** To synchronize contacts to secure correct firing interval use Delco-Remy tool, Part No. 820738, and follow directions on Page S-2. Contacts can be synchronized without use of the tool after distributor is timed to engine by cranking engine over 90 degrees from firing position of piston No. 1 when piston No. 6 will reach firing position. The second set of contacts should separate at this point. If they do not, loosen lock screws and turn eccentric adjusting screw until contacts begin to separate. Check contact gap with breaker arm on lobe of cam. If it is not within limits of .018-.024 inch, reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 2 teeth on the flywheel before top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever. Continue to crank engine until flywheel mark 'IGN' is opposite the pointer on the flywheel case. This mark is two teeth before the top dead center mark on the flywheel. Loosen the advance arm clamp screw and turn the distributor until the contacts begin to separate. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 15/32 inches; stem diameter, 5/16 inch; stem length, 4 61/64 inches. Tappet clearance, .006-.008 inch. Spring pressure, 70 pounds. Valve lift, 21/64 inch. Inlet valves open 6 degrees before top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 11/32 inches; stem diameter, 5/16 inch; stem length, 4 61/64 inches. Tappet clearance, .006-.008 inch. Spring pressure, 70 pounds. Valve lift, 21/64 inch. Exhaust valves open 40 degrees before lower dead center and close 6 degrees after top dead center. Valve stem guides are not removable. Oversize valve stems are not made.

Continued on reverse side.

MARMON

MODEL 68 (1928)

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

STARTER:—Model 714-C. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the commutator end oiler every month or each 750 miles. The drive end bearing is oilless.

GENERATOR:—Model 949-X. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 162°F. cutting the resistance across the thermostat contacts in series with the shunt winding and reducing the output approximately 40%. To adjust generator output, loosen the small round-headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the charging rate is 9-12 amperes (hot) reached at 2000 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21	8.5	1450	12	7.5	2000

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Generator brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left of engine by special swinging bracket and is driven by the fan belt. To remove generator, disconnect lead and remove clamp nut on top front of generator. Swing generator toward engine and slip off fan belt. Remove two bolts from special bracket under generator and lift generator from place.

To Adjust Fan Belt. Loosen clamp bolt at top of generator. Swing generator out from engine until proper belt tension is secured. Tighten clamp bolt. Be careful not to make belt too tight. This will cause generator bearing trouble.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every month or each 750 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay contacts close at 575 R.P.M. or 10 M.P.H. when the generator voltage reaches 6.75-7.5 volts and open at 8 M.P.H. with a discharge current of 0-2.5 amperes. Charging current is approximately 2 amperes at closing of contacts. Contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Model Special. Switch is located on lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dash and tonneau lights are each 6-8 volt, 3 cp. D.C. Mazda No. 64. Side, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is located on the back of the ignition switch. It begins to vibrate when the current reaches 25-30 amperes, limiting the current to 10-15 amperes until the short circuit is removed.

Model 78 (1928)
Delco-Remy System
Plate No. 1341

MARMON

MODEL 78 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 615JFK, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under the driver's seat on the left side.

IGNITION:—Coil Model 525-C. Coil is mounted on the left side of the engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-M. Breaker contacts separate .022 inch. Set contact gap with breaker arm on lobe of cam by loosening lock screw on stationary contact plate and turning eccentric adjusting screw until proper gap is obtained. Resurfacing contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Breaker has two sets of contacts on a single four-sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Marmon engine and it must be accurately set. (See Timing.) Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 40 degrees reached at 3000 R.P.M. Total advance 60 degrees (engine).

Mounting:—Distributor is mounted on special flange at left side of engine block. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then remove manual advance stop screw in advance arm and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every month or each 750 miles. Once each month remove the distributor head and rotor and saturate the wick oiler in the center of the shaft with light oil.

Timing:—**Synchronization of Contacts.** To synchronize contacts to secure correct firing interval use Delco-Remy tool, Part No. 820738, and follow directions on Page S-2. Contacts can be synchronized without use of the tool after distributor has been timed to the engine by cranking engine over 90 degrees from firing position of No. 1 piston when piston No. 6 will reach firing position. The second set of contacts should separate at this point. Loosen lock screws and turn eccentric adjusting screw until contacts begin to separate. Tighten the lock screws and check the contact gap. If it is outside limits of .018-.024 inch with breaker arm on lobe of cam, reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine. Breaker contacts begin to separate when the piston entering power stroke reaches a position 5 teeth on the flywheel before top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever. Continue to crank engine until the fifth tooth on the flywheel before the top dead center mark 'DC1-8' is opposite the indicator on the flywheel housing. Loosen the advance arm clamp screw and rotate the distributor until one set of contacts begin to open. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 29/64 inches; stem diameter, 5/16 inch; stem length, 5 23/32 inches. Valve lift, 21/64 inch. Spring pressure, 130 pounds. Tappet clearance, .008 inch. Inlet valves open 6 degrees before top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 17/64 inches; stem diameter, 5/16 inch; stem length, 5 23/32 inches. Valve lift, 21/64 inch. Spring pressure, 130 pounds. Tappet clearance, .008 inch. Exhaust valves open 40 degrees before lower dead center and close 6 degrees after top dead center. Valve stem guides are not removable. Oversize valve stems are not made.

Continued on reverse side.

MARMON

MODEL 78 (1928)

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

STARTER:—Model 726-A. Starter is connected to the engine through a disc clutch and a manually operated pinion shift connected to the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal rod and remove nuts from 3 flange mounting bolts. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the starter every month or each 750 miles. The drive end bearing is oilless.

GENERATOR:—Model 949-F. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 162°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round-headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the charging rate is 12 amperes (hot) reached at 2000 R.P.M. or approximately 25 miles per hour.

Generator Data

Cold Test		R.P.M.	Hot Test		R.P.M.
Amperes	Volts		Amperes	Volts	
21	8.5	1450	9-12	7.5	2000

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Generator brush spring tension is 14-18 ounces.

Mounting:—Generator is cradle mounted at left of engine and is driven by the fan belt. To remove generator, disconnect water pump drive coupling and remove nut from stud on generator strap. Then slip off fan belt and lift generator from place.

Fan Belt Adjustment. The tension of the fan belt must be sufficient to drive both the fan and generator without slipping. To tighten fan belt, loosen three cap screws in fan lock ring and rotate eccentric fan adjuster by means of a punch or pin inserted in the fan ring holes until the proper belt tension is obtained. Then tighten the 3 cap screws.

Oiling:—Put 4 or 5 drops of light oil in each of the generator bearing oilers every 750 miles or each month.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes at 575 R.P.M. or 10 M.P.H. when the generator voltage reaches 6.75-7.5 volts and opens at 8 M.P.H. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch, Special Model. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Side, dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dome and tonneau lights are each 6-8 volt, 3 cp. D.C. Mazda No. 64.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the ignition switch. It begins to vibrate at 25-30 amperes and continues limiting the current to 10-15 amperes until the short circuit is removed.

MODEL 6-72 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—U.S.L., Type XY-15X6, 6 volt, 15 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted under the left front seat.

IGNITION:—Coil Model 525-C. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped. Ignition coil is mounted on the engine side of the dash.

Distributor Model 640F. Breaker contacts separate .018-.024 inch. Adjust contact by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw directly behind breaker arm until proper gap is secured. Tighten the lock screw. Resurface contacts with a fine contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 500 R.P.M. of engine. Maximum automatic advance is 30 degrees reached at 3200 R.P.M. Ignition switch is Model 1302 or 1325.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then loosen clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium heavy grease and turn down one turn every 500 miles. Every month put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual advance lever fully retarded. To set timing, crank engine until piston No. 6 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Then continue to crank engine until piston No. 6 reaches top dead center when the flywheel mark 'IGN' will be opposite the indicator on the flywheel housing. Loosen clamp screw and rotate distributor until contacts begin to separate. Connect the segment opposite the rotor button with the spark plug in cylinder No. 6 and connect the remaining plugs in order 2-4-1-5-3 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 5/16 inches; stem diameter, 11/32 inch; stem length, 5 11/32 inches. Tappet clearance, .004 inch (hot). Valve lift, 5/16 inch. Intake valves open 5 degrees after top dead center and close 45 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 3/16 inches; stem diameter, 11/32 inch; stem length, 5 11/32 inches. Tappet clearance, .006 inch (hot). Valve lift, 5/16 inch. Exhaust valves open 40 degrees before lower dead center and close 5 degrees after top dead center.

STARTER:—Model 714-G. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Model 406-A. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting bolts. Then pull starter forward and lift from place.

Oiling:—Put 5 or 6 drops of light oil in the oiler on the commutator end of the starter every 1000 miles. The drive end bearing is oilless.

 DELCO-REMY GENERATING, STARTING SYSTEM
 DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 949-V. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate. Remove the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 20 amperes (cold) reached at 1450 R.P.M. or 25 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.5	1450	9-12	7.5	2000

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, take off sprocket cover in front of timing chain case directly over generator sprocket and remove nut on end of generator shaft. Then remove flange mounting bolts and pull generator to rear. Be careful not to disturb chain on generator sprocket and do not attempt to crank engine with generator out.

Timing Chain Adjustment:—Timing chain is adjusted by shifting generator. To adjust chain, loosen two generator flange mounting cap screws and turn up adjusting set screw with engine running until chain begins to hum. Then back off adjustment screw until chain runs noiselessly and tighten cap screws.

Oiling:—Put 8 to 10 drops of light oil in the oiler on the commutator end of the generator every 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the voltage of the generator reaches 6.75-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 1309. Switch is mounted on the lower end of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 6 cp. D.C. Mazda No. 82. Side (cowl) lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the ignition switch. Circuit breaker begins to vibrate at 25-30 amperes and continues with a current of 10-15 amperes.

Plate No. 1343

BATTERY:—U.S.L., Type 3-HVX-7X, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 148.5 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 28.4 hours.

IGNITION:—Coil Model 525-C. Ignition coil is mounted on the dash. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-F or 658-H. Breaker contacts separate .022 inch. Set contact gap by loosening lock nut on stationary contact plate and turning eccentric adjusting screw until contact gap is .022 inch with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oil-stone. Breaker arm spring tension is 17-21 ounces. There are two sets of breaker contacts on a single four sided cam. Contacts open alternately at intervals of 45 degrees corresponding to 90 degrees of crankshaft rotation. This is the correct firing interval for the Moon engine and contacts must be synchronized to secure proper firing interval. See Timing. Distributor is semi-automatic. Maximum manual advance is 33 degrees (engine) on the 658-F and 22 degrees (engine) on the 658-H. Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 18 degrees reached at 3200 R.P.M.

Mounting:—Distributor is mounted at right of engine directly in front of the generator. To remove distributor, disconnect manual advance rod and primary lead and remove head with cables intact. Then remove manual advance stop screw and lift distributor from place.

Oiling:—Fill the grease cup under the distributor head and turn down two turns every 1000 miles. Every 5000 miles remove the head and rotor and saturate the wick oiler in the center of the shaft with light engine oil. Put a small amount of heavy grease on the face of the breaker cam.

Timing:—**Synchronization of Contacts:**—To synchronize contacts, use Delco-Remy Tool, Part No. 820738, and follow directions given on Page S-2 of Reed Service Manual. Contacts can be synchronized without tool after distributor has been timed to engine by turning over engine 90 degrees from firing position of piston No. 1 when piston No. 6 will reach top dead center entering firing stroke. Make certain that manual spark control is fully retarded. If one set of breaker contacts are not separating, loosen lock screws on breaker plate and turn eccentric adjusting screw until contacts begin to separate. Tighten the lock screws and check contact gap. If it is outside limits of .018-.024 inch, reset at .022 inch and repeat synchronizing operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Continue to crank engine until piston reaches top dead center. If one set of contacts is not opening, loosen advance arm clamp screw and rotate distributor until contacts open. Tighten the clamp screw. Connect the segment opposite the rotor to the spark plug in cylinder No. 1 and connect the remaining spark plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 3/8 inches; stem diameter, 5/16 inch. Valve lift, 5/16 inch. Tappet clearance, .004 inch (hot). Inlet valves open 8 degrees after top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/4 inches; stem diameter, 5/16 inch. Valve lift, 5/16 inch. Tappet clearance, .006 inch (hot). Exhaust valves open 40 degrees before lower dead center and close 8 degrees after top dead center.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter oiler every 1000 miles.

GENERATOR:—Model 940-K or 940-H. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 20 amperes reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20	8.5	1450	9-12	7.5	2000

Generator motoring draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove the flange mounting cap screws. Remove carburetor. Then slide generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at base of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81. Side (cowl) lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

Switches:—Lighting switch is Delco-Remy Model 1309. Ignition switch is Delco-Remy Model 1302 or 1325.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the ignition switch. It begins to vibrate when the current reaches 25-30 amperes and limits the current to 10-15 amperes while operating.

STANDARD SIX (1927-28) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-HVX-5X6, 6 volt. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18.4 hours. The negative (—) terminal is grounded. Battery is mounted under front floor board on left frame member.

IGNITION:—Coil Model IG-4065. Coil is mounted on the front of the dash. Ignition current is 1.2 amperes at 6.2 volts with engine running and 4.8 amperes (cold) or 4.4 amperes (hot) at 6.2 volts with engine stopped.

Distributor Model IGA-4016. Breaker contacts separate .020-.024 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is of full automatic type. Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 30° (engine) reached at 3380 R.P.M. Breaker arm spring tension is 18-20 ounces.

Mounting:—Distributor is mounted on top of the cylinder block. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then remove set screw and lock nut on side of distributor shaft housing and lift distributor from place.

Oiling:—Fill the oiler on the side of the distributor housing with light engine oil every 500 miles. Put one drop of oil on the breaker arm pivot pin and put a small amount of vaseline on the face of the breaker cam every 1000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center. To set timing, crank engine until piston No. 1 reaches top dead center of compression stroke. This is the upstroke with both valves closed. At this point the notch in the front face of the flywheel will be in line with the point on the rear motor support. If breaker contacts are not separating, loosen clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 13/32 inches; stem diameter, 5/16 inch; stem length, 4 23/32 inches. Valve lift, 1/4 inch. Spring pressure, 45 pounds. Tappet clearance, .005 inch (hot). Inlet valves open 5° after top dead center and close 45° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, 5/16 inch; stem length, 4 23/32 inches. Valve lift, 1/4 inch. Spring pressure, 45 pounds. Tappet clearance, .005 inch (hot). Exhaust valves open 45° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025-.030 inch.

STARTER:—Model MN-4108. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 184 R.P.M. drawing 160 amperes at 4.7 volts. Starter brush spring tension is 1 1/4-1 1/2 pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	5.5	45 (No Bendix)
0 "	Free	5.5	50 (With Bendix)
.6 "	2700	5.5	100
2.5 "	1500	5.0	200
5 "	850	4.5	300
7.5 "	650	4.0	400
11.5 "	Lock	3.0	540

Mounting:—Starter is flange mounted on left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 2 flange mounting bolts. Then pull starter forward and lift from place.

Continued on reverse side.

NASH

STANDARD SIX (1927-28) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the drive end of the starter every 1000 miles. The commutator end bearing is oilless.

GENERATOR:—Model GYA-4205. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove cover band and shift third brush by applying pressure to third brush mounting bracket. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. With maximum setting the charging rate is 19 amperes at 8 volts. The third brush is held in position by friction between the mounting bracket and the end plate. With standard setting, charging rate is 16 amperes at 7.9 volts reached at 1200 R.P.M. or 30-35 M.P.H.

Generator Data

5	7.0	700	5	7.3	840
10	7.3	860	10	7.7	1100
14	7.7	1050	14	7.9	1600
16	7.9	1200			

Running as a motor, generator draws 5 amperes at 6 volts. Shunt field current is 3.8 amperes at 6.2 volts. Brush spring tension is 1¼-1½ pounds each.

Mounting:—Generator is flange mounted at left of engine on rear of front engine cross member. Generator is belt driven from crankshaft and fan is driven from generator pulley. To remove generator, remove 2 flange mounting bolts and slide generator toward engine block. Slip off belts and pull generator toward rear. Lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY:—Model CB-4007. Relay is mounted on top of the generator. Contacts close at 620 R.P.M. when the voltage of the generator reaches 7-7.5 volts and open with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng Manigold Switch, Model 17289A. Switch is mounted on steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse on switch is 20 amperes.

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type CWR-15, 6 volt, 15 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 115 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Plates are 5 $\frac{3}{4}$ inches wide, 4 $\frac{3}{4}$ inches high, 3/32 inch thick. Battery is mounted under front floor boards on left frame member.

IGNITION:Coil Model 284-A. Coil is mounted on the engine block. Ignition current is 2 amperes at 6 volts with engine running and 4 amperes at 6 volts with engine stopped.

Distributor Model 640-B. Breaker contacts separate .018-.024 inch. Adjust contact opening by loosening lock screw on end of stationary contact mounting plate and turning eccentric adjusting screw to secure proper adjustment. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Maximum automatic advance is 21° (engine).

Mounting:—Distributor is mounted at left of engine block. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen clamp screw and lift distributor from place.

Oiling:—Fill the grease cup with medium cup grease and turn down one turn every 800 miles. Every 1000 miles remove the distributor head and rotor and put 4 or 5 drops of oil in the wick oiler in the center of the shaft.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly fully retarded. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Loosen clamp screw on side of mounting and turn distributor until contacts begin to separate. Tighten the clamp screw. Connect the segment opposite the rotor to the spark plug in cylinder No. 1 and connect the remaining plugs in order 5-3-6-2-4 around the distributor in a counter-clockwise direction.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8 inch pipe threaded. Gaps are .022 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 $\frac{5}{8}$ inches; stem diameter, .31 inch; stem length, 5 1/16 inches. Valve lift, 9/32 inch. Spring pressure, 40-50 pounds. Tappet clearance, .007-.009 inch. Inlet valves open 5° after top dead center and close 40° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 $\frac{1}{2}$ inches; stem diameter, .31 inch; stem length, 5 1/16 inches. Valve lift, 9/32 inch. Spring pressure, 40-50 pounds. Tappet clearance, .007-.009 inch. Exhaust valves open 45° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 714-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-175 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the commutator end oiler every 1000 miles. The drive end bearing is oilless.

Continued on reverse side.

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 949-N. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. and the resistance across the thermostat contacts is inserted in the shunt field circuit cutting the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, charging rate is 14 amperes (hot) or 17 amperes (cold) reached at 1400 R.P.M. or approximately 20 miles per hour.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
17-21	8.5	1450	12	7.5	2000

Motoring generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is mounted at left front of engine by special swinging bracket and is driven by fan belt. To remove generator, disconnect lead and loosen nut on special adjustment bracket and swing generator toward engine block. Slip off belt. Then remove two bolts in bracket under generator and lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the generator every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 7-10 M.P.H. or 575 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch is mounted on the instrument board. Dimming is by double filament head light bulbs controlled by Dimmer Switch Model 465-B mounted on the toeboard. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base) Mazda No. 1110. Parking lights (in head lamps) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash, tail, side, stop, backing, dome and tonneau lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

Switches:—Lighting switch is Clum Model 10708 or 10712. Stop light and back light switch is Model 8665. Choke and throttle control (to match switch) is Model 8593, 8716 or 8736.

FUSES:—Lighting fuse on back of switch is 20 amperes. A spare fuse is also mounted on the switch.

Model F-28 (1928)
Delco-Remy System
Plate No. 1346

BATTERY:—Willard, Type XWR-13, 6 volt, 13 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 98 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 16 hours. Plates are 5 $\frac{3}{4}$ inches wide, 4 $\frac{3}{4}$ inches high, 3/32 inch thick. Battery is mounted under the front floor boards.

IGNITION:—Coil Model 550-F. Coil is mounted on the dash with ignition switch in base extending through the instrument board. Ignition current is .5-2.5 amperes at 6 volts with engine running and 4.5 amperes at 6 volts with engine stopped.

Distributor Model 639-B. Breaker contacts separate .020-.025 inch. Adjust contact opening by loosening lock screw on plate directly back of contacts and turn eccentric adjusting screw to secure proper adjustment. Tighten the lock screw. Resurface contacts with a fine flat contact file or on a medium hard oil-stone. Distributor is full automatic. Automatic advance begins at 500 R.P.M. Maximum automatic advance is 18° reached at 2500 R.P.M. Breaker arm spring tension is 17-21 ounces.

Mounting:—Distributor is mounted on cylinder head. To remove distributor, disconnect primary lead and remove distributor head with high tension cables intact. Then remove clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down one turn every 1000 miles. At the same time, remove the distributor head and rotor and saturate the wick in the oiler in the center of the shaft.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .020 inch before top dead center with the breaker assembly in the fully retarded position. To set timing, crank engine until piston No. 1 reaches firing position. Then loosen clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and connect the segment opposite the rotor to spark plug in cylinder No. 1. Connect remaining plugs in order 5-3-6-2-4 around distributor head in a clockwise direction.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 18 MM. metric. Gaps are .027 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 15/32 inches; stem diameter, 11/32 inch; stem length, 4 $\frac{3}{4}$ inches. Valve lift, 5/16 inch. Spring pressure, 48 pounds closed, 68 pounds open. Tappet clearance, .008 inch (hot). Inlet valves open at top dead center and close 50° after lower dead center. Inlet opening point is marked on flywheel by mark 'TDC-1-6'.

EXHAUST VALVES:—Head diameter, 1 13/32 inches; stem diameter, 11/32 inch; stem length, 4 $\frac{3}{4}$ inches. Valve lift, 5/16 inch. Spring pressure, 48 pounds closed, 68 pounds open. Tappet clearance, .008 inch (hot). Exhaust valves open 40° before lower dead center and close 10° after top dead center. Valve stem guides are removable.

STARTER:—Model 714-H. The direction of rotation is counter-clockwise, looking at the commutator end. Starter is connected to the engine through an over-running clutch and pinion. Starter cranks the engine at 125 R.P.M. drawing 130 amperes at 5.5 volts. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes

MODEL F-28 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the commutator end of the starter every 1000 miles.

GENERATOR:—Model 949-W. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F, putting the resistance across the contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, the maximum charging rate is 19 amperes (cold) reached at 1700 R.P.M. or 25 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
20	8.5	1600	11	6.75	1800

Motoring generator draws 7 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted on right side of engine on rear of timing chain case. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then pull generator to the rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the commutator end oiler every 1000 miles. The drive end bearing is oiled by splash from the chain case.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 12 M.P.H. or 650 R.P.M. when the generator voltage reaches 7-7.5 volts and opens at 10 M.P.H. or 600 R.P.M. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 486-B. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base, using second filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail, side and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the dash to protect lighting circuits. Circuit breaker begins to operate when the current reaches 25-30 amperes and continues to vibrate limiting the current to 15 amperes until the short circuit is removed.

MODEL 6-80 (1928) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type XY-15X-6, 6 volt. Starting capacity is 119 amperes for 20 minutes. Lighting capacity is 5 amperes for 20.8 hours. The positive (+) terminal is grounded. Battery is mounted on the frame at right of the car.

IGNITION:—Coil Model IG-4065. Distributor Model IFA-4003 A. Breaker contacts separate .020-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1.5 amperes with engine running and 4.5 amperes with engine stopped. Distributor is semi-automatic. Manual advance is 20 degrees. Automatic advance begins at 1500 R.P.M. Maximum automatic advance is 20 degrees at 3600 R.P.M.

Mounting:—Distributor is mounted on the right side of the engine forward of the generator. To remove distributor, loosen lock nut and remove set screw on side of distributor mounting bracket. Then lift distributor from place.

Oiling:—Refill the grease cup on the side of the distributor housing with medium cup grease and turn down two turns every two weeks or each 500 miles. Every 1000 miles put one drop of light engine oil on the breaker arm pivot pin. Every 5000 miles put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position two teeth on the flywheel before top dead center with the manual spark control lever in the fully advanced position. To set timing, crank engine until piston No. 1 enters compression stroke (this is the upstroke with both valves closed). Remove the clutch inspection plate and continue to crank engine until the second tooth on the flywheel before the top dead center mark is opposite the indicator on the flywheel case. Make certain the manual spark control lever is in the fully advanced position. Then loosen the clamp screw on the advance arm and rotate the distributor cup until the contacts begin to separate. Tighten the clamp screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Valve Timing:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, .370-.371 inch; valve length, 5 45/64 inches; valve lift, 5/16 inch; spring pressure, 75-80 pounds; tappet clearance, .006 inch. Inlet valves open 4° after top dead center and close 46° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 5/8 inches; stem diameter, .370-.371 inch; valve length, 5 45/64 inches; valve lift, 5/16 inch; spring pressure, 75-80 pounds; tappet clearance, .006 inch. Exhaust opens 41° before lower dead center and closes 1° after top dead center. Valve stem guides are removable.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model MN-4114. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 120 R.P.M. drawing 130 amperes at 5.2 volts. Starter switch is Model SW-4001. Brush spring tension is 1 1/4-1 1/2 pounds each.

Starter Data

PEERLESS

MODEL 6-80 (1928) AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward from place.

Oiling:—Put 5 to 10 drops of light engine oil in the oiler on the drive end of the starter every month or each 1000 miles. The commutator end bearing is oilless and requires no attention.

GENERATOR:—Model GAG-4101. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by the third brush system. To adjust generator output, remove the commutator cover band and shift the third brush mounting bracket by prying on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush mounting bracket is held in any desired position by friction between the mounting stud and the generator end plate. Maximum charging rate is 18 amperes (cold) with standard car setting. This is reached at 1400 R.P.M. or 23-24 miles per hour.

Generator Data (Cold)

Amperes	Volts	R.P.M.
0	6.40	475
4	6.75	575
8	7.10	700
12	7.45	850
16	7.80	1050
18	8.00	1300

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 4.5 amperes at 6 volts. Generator brush spring tension is 22-28 ounces.

Mounting:—Generator is mounted on rear of timing chain case at right of engine. To remove generator, disconnect lead and remove two mounting studs extending through flange of timing chain case. Pull generator to rear and lift from place.

Adjustment of Timing Chain:—The timing chain is adjusted by loosening the top generator mounting stud and taking up on the adjustment nut. The chain must be loose enough to run quietly. If the chain hums the adjustment nut must be backed off until the noise stops.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model CB-4007. Relay is mounted on top of the generator. Relay closes at 8 M.P.H. or 550 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens at 7 M.P.H. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is .5-3 amperes. Contacts separate .030 inch. Air gap between relay armature and coil core is .010-.030 inch, contacts closed.

LIGHTING:—Soreng Manegold Lighting Switch. Clum Switch Model No. 10687—Auto-Lite No. XA-322. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using 21 cp filament instead of dimming) Mazda No. 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes.

PEERLESS

MODEL 6-91 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

PEERLESS
Model 6-91 (1928)
Delco-Remy System
Plate No. 1348

BATTERY:—U.S.L., Type XY-15X. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 119 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20.8 hours. Battery is mounted on the right frame member.

IGNITION:—Coil Model 525-C. Coil is mounted on the dash. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 641-B. Breaker contacts separate .018-.024 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 30 degrees (engine). Automatic advance begins at 800 R.P.M. Maximum automatic advance is 10 degrees reached at 4000 R.P.M.

Mounting:—Distributor is mounted on the cylinder head. To remove distributor, disconnect manual advance rod and remove head with cables intact. Then remove stop screw in manual advance arm and lift distributor from place. An Electrolock, Type 5-B, is used. This must be taken off the dash and removed with the distributor whenever the distributor is taken off the car.

Oiling:—Fill the grease cup on the side of the shaft housing with medium cup grease and turn down one half turn every 1000 miles. Put one drop of oil on the breaker arm pivot pin and a small bit of vaseline on the face of the breaker cam every 5000 miles.

Timing:—Breaker contacts begin to separate when the flywheel mark 'IGN' is under the pointer in the flywheel housing hand hole with piston No. 1 entering power stroke and the spark control lever fully advanced. To set timing, fully advance spark control lever. Then crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Continue to crank engine until the flywheel mark is under the pointer. If the breaker contacts are not separating, loosen the advance arm clamp screw and rotate the distributor housing until contacts begin to separate. Tighten the clamp screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 13/16 inches; stem diameter, .370-.372 inch; stem length, 6 1/4 inches. Tappet clearance (hot), inlet valve, .004 inch; exhaust valve, .006 inch. Spring pressure, 110-120 pounds. Valve lift, 1 1/32 inch.

Timing:—Inlet valves open at top dead center and close 50 degrees after lower dead center. Exhaust valves open 50 degrees before lower dead center and close at top dead center. Valve stem guides are removable. Oversize valve stems are not made. In setting camshaft, first set tappet clearance at .008 inch.

STARTER:—Model 720-Z. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. The brush spring tension is 24 to 28 ounces each. Starter switch is Model 406-G.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.1	570

Mounting:—Starter is barrel mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove large pilot mounting screw from housing directly above starter sleeve. Then pull starter forward and lift from place.

Continued on reverse side.

MODEL 6-91 (1928) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

Oiling:—Put 8 to 10 drops of good grade medium oil in the hinged cap oiler on the commutator end every 1000 miles. The drive end bearing is oilless. It requires no attention.

GENERATOR:—Model 945-Q. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165 degrees F. cutting the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, remove the commutator cover band and loosen the small round headed screw on the commutator end plate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 18-20 amperes at 1300 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
18-20	8.3-8.5	1300	9-12	7.35-7.65	1300-1500

Generator motoring draws 5.5 amperes at 6 volts. Brush spring tension is 14-18 ounces. Shunt field current is 5 amperes at 6 volts.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove the flange mounting cap screws. Then slide generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Lighting switch is mounted at base of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Stop light is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Side lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dome light is 6-8 volt, 6 cp. S.C. Mazda No. 81.

FUSES:—Lighting fuses on fuse block are 20 amperes.

Production Started November 3, 1927

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

PIERCE ARROW

Model 81 (1928)
Delco-Remy System

Plate No. 1349

BATTERY:—Willard, Type SJRR-4, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Battery is mounted under front floor boards on the right frame member.

IGNITION:—Coil Model 552-B. Ignition current is 2 amperes at 6 volts with engine running and 3.5 amperes at 6 volts with engine stopped. Ignition coil is mounted on the dash with the ignition switch in the base of the coil.

Distributor:—Number 17042 (integral with generator). Breaker contacts separate .020-.025 inch with breaker arm on lobe of cam. Adjust contact opening by loosening lock screw on stationary contact stud and turning up stud until proper gap is secured. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 40 degrees (engine). Automatic advance begins at 600 R.P.M. of engine. Maximum automatic advance is 16 degrees reached at 2000 R.P.M.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with cables intact. Then remove manual advance stop screw in advance arm and lift distributor from place.

Oiling:—Put 8 or 10 drops of light oil in each of the two oilers on the side of the distributor housing every two weeks or each 500 miles. Twice each year remove the plug in the gear compartment and repack gears with medium soft cup grease. Once a month put a small bit of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $2\frac{1}{4}$ inches (on the flywheel) past top dead center with the spark control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Continue to crank engine until 'ignition' mark on flywheel is in line with mark on flywheel housing. This mark is $2\frac{1}{4}$ inches past the top dead center mark. Loosen screw in center of breaker cam and turn cam with rotor in place until contacts begin to separate with rotor in position opposite No. 1 terminal in head. Opening of contacts can be checked with ignition turned on by watching dash ammeter. Ammeter pointer will move from 'Discharge' to '0' as contacts open. Tighten the screw in the cam and connect No. 1 terminal in head opposite rotor to spark plug in cylinder No. 1. Connect remaining plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are $\frac{1}{32}$ inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1.75 inches; stem diameter, .3715 inch; stem length, $6\frac{1}{16}$ inches. Valve lift, $11\frac{1}{32}$ inch. Spring pressure, 71 pounds. Tappet clearance, .003 inch. Inlet valves open 17 degrees before top dead center and close 67 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1.50 inches; stem diameter, .3715 inch; stem length, 6 inches. Valve lift, $11\frac{1}{32}$ inch. Spring pressure, 71 pounds. Tappet clearance, .003 inch. Exhaust valves open 62 degrees before top dead center and close 22 degrees after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 336. Starter is connected to the engine through a manually operated gear shift and an overrunning clutch. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is $2\frac{1}{4}$ - $2\frac{1}{2}$ pounds each. Starter cranks the engine at 110-120 R.P.M. drawing 280-450 amperes at 4.5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	40
4.5 "	700	5	200
19 "	Lock	3	500

Mounting:—Starter is flange mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and pedal rod and remove 3 flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 300. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush by means of the handle on the brush mounting plate. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush is held in any desired position by friction washers. Maximum charging rate is 24 amperes (cold) reached at 1600 R.P.M. or approximately 20-25 M.P.H. Average output required is 15 amperes.

Generator Data

Amperes	Volts	R.P.M.
5		800
11		1000
15	7.5-8	1600

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 2.5 amperes at 6 volts. Brush spring tension is 20-28 ounces.

Mounting:—Generator is base mounted at right of engine. To remove generator, disconnect lead and remove distributor cap with cables intact. Then disconnect coupling at each end of generator and remove 2 hold-down screws in base. Lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close when the generator voltage reaches 6.75 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contact gap is .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Head, stop and backing lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Auxiliary head lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash, tail, tonneau lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81. Dome light is 6-8 volt, 15 cp. S.C. Mazda No. 87.

Switches:—Lighting switch is Delco-Remy Model 1320. It is mounted on the dash panel. Dimmer switch is Delco-Remy Model 465-B. It is mounted on the toeboard.

FUSES:—Main circuit fuse is 30 amperes capacity. All other fuses are 10 amperes.

BATTERY:—U.S.L., Type XY-13X-6, 6 volt, 13 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 102 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the front floor boards on the left frame member.

IGNITION:—Coil Model 525-C. Ignition coil is mounted on the engine block. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 639-A. Breaker contacts separate .020-.025 inch. Adjust contact opening by loosening lock screw on stationary contact plate and turning eccentric adjusting screw to secure correct contact opening. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is full automatic. Maximum automatic advance is 18 degrees (engine).

Mounting:—Distributor is mounted on the top of the engine block. To remove distributor, disconnect primary lead and remove distributor head with cables intact. Then loosen clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft and turn down one turn every 500 miles. Every 1000 miles remove the head and rotor and put 4 or 5 drops of light oil in the wick oiler in the center of the shaft.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the breaker assembly in the fully retarded position. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). At this point the flywheel mark '1-6 UDC' will be opposite the indicator. Loosen clamp screw and turn distributor until contacts begin to separate. Tighten the clamp screw and connect segment opposite rotor to spark plug in cylinder No. 1. Connect remaining plugs in order 5-3-6-2-4 around distributor head in a counter-clockwise direction.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .022 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 11/32 inches; stem diameter, .310 inch; stem length, 3 3/8 inches. Valve lift, 6/32 inch. Spring pressure, 32-37 pounds. Tappet clearance, .007-.009 inch. Valve stem guides are removable. Oversize valve stems are not made.

Valve Timing:—Inlet valves open 7° after top dead center and close 39° after lower dead center. Exhaust valves open 42° before lower dead center and close 7° after top dead center.

STARTER:—Model 714-F. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100-175 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	5000	5	65
12 "	Lock	3.63	475

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the commutator end oiler every 1000 miles. The drive end bearing is oilless.

GENERATOR:—Model 943-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 17 amperes (cold) reached at 1600 R.P.M. or 20 miles per hour.

Generator Data					
Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
7	7.3	850			
17	8.0	1700	11.3	7.7	1800
11		2500			

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 16-18 ounces.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect lead and remove flange mounting cap screws. Pull generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light oil in each of the generator oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 7-10 M.P.H. or 575 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current is approximately 2 amperes at closing of contacts. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch is mounted on the instrument board. Dimming is by double filament bulbs controlled by switch on toeboard. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base) Mazda No. 1110. Side, dash, stop and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

Switches:—Lighting switch is Clum Model 10707. Stop light and back light switch is Clum Model 8665. Choke and throttle control (to match switch) is Clum Model 8730.

FUSES:—Lighting fuse on switch is 20 amperes capacity. A spare fuse is also mounted on the switch.

FLYING CLOUD MODEL (1928) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

REO
 Flying Cloud (1928)
 Delco-Remy System
 Plate No. 1351

BATTERY:—Willard, Type SJRR-4, 6 volt. Starting capacity is 125 amperes for 20 minutes. Lighting capacity is 5 amperes for 22 hours. The negative (—) terminal is grounded.

IGNITION:—Coil Model 525-E. Distributor Model 636-K. Breaker contacts separate .018-.024 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Manual advance is 25° (engine). Automatic advance begins at 1000 R.P.M. and reaches a maximum of 21° at 2800 R.P.M. of the engine. The ignition switch is Model 440-B.

Mounting:—Ignition coil is mounted on the dash. Distributor is mounted on cylinder head and is driven by spiral gears from the camshaft. To remove distributor, disconnect primary lead and manual advance rod and remove distributor head with high tension cables intact. Then loosen distributor clamp screw and lift distributor from place.

Oiling:—Refill the grease cup under the distributor head with medium cup grease and turn down two turns every month or each 1000 miles. Put a small amount of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position one inch after top dead center (on the flywheel) with the spark lever and breaker assembly fully retarded. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke (the upstroke with both valves closed). Then remove inspection hole cover in top of flywheel case. The flywheel marking 'UDC' will be opposite the indicator line in the edge of the opening. Fully retard spark lever and crank engine over one inch when flywheel mark will be one inch past the indicator. Breaker contacts should separate at this point. If they do not, loosen advance clamp screw and rotate until contacts begin to separate. Tighten the clamp screw.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .030 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 13/16 inches; stem diameter, .3437 inch. Spring pressure, 52 1/2 pounds. Tappet clearance, .004 inch (inlet) and .006 (exhaust).

Timing:—Inlet valves open at top dead center and close 40 degrees after lower dead center. Exhaust valves open 48 degrees before lower dead center and close 2 degrees after top dead center. Flywheel is marked 'UDC No. 1 Int. Open' for intake opening of cylinder No. 1.

STARTER:—Model 724-E. Starter is connected to the engine through a mechanical pinion shift and an overrunning clutch. The direction of rotation of the armature shaft is clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces each.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	3500	5	70
22 "	Lock	3	600

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles. Every six months or each 5000 miles, remove the grease plug in the gear case and repack the reduction gears with medium cup grease.

Continued on reverse side.

REO

FLYING CLOUD MODEL (1928) DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM DELCO-REMY IGNITION

Continued from preceding page.

GENERATOR:—Model 949-B. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field combined with a thermostat. Thermostat contacts open at 160°F. cutting a resistance in the field circuit and reducing the output approximately 40%. To adjust the generator output, remove the commutator cover band and loosen the small round headed screw on the generator endplate. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 18-19 amperes (cold) reached at 1450 R.P.M. or 25-26 M.P.H.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
21	8.5	1450	9-12	7.5	2000

Motoring freely, generator draws 5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts, directly across field terminals. Brush spring tension is 24-28 ounces each.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove flange mounting cap screws. Then slide generator to the rear. Generator drive is by slotted tongue from chain sprocket. Adjustment of timing chain is provided by loosening the generator mounting screws and moving the generator sideways. The chain should be loose enough to run noiselessly.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Model 265-B. Relay is mounted on top of the generator. Relay closes when the voltage of the generator reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is 3 amperes. Relay contacts separate .015-.025 inch. Air gap between relay armature and coil core is .014-.021 inch, contacts closed.

LIGHTING:—Delco-Remy Switch Model 482-F. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuse on block mounted on the dash is 20 amperes.

REO

Flying Cloud (1928)

REO

WOLVERINE MODEL (1928) NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM NORTH EAST IGNITION

BATTERY:—Willard, Type RR-13, 6 volt, 90 ampere hour. Battery has 13 plates. The negative (—) terminal is grounded.

IGNITION:—Coil Type 17232. Ignition coil is mounted on the dash. Current is 1 ampere at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Type 10820-A. Breaker contacts separate .020 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 20 degrees. Automatic advance begins at 400 R.P.M. Maximum automatic advance is 22½ degrees at 2000 R.P.M. of the engine. An electrolock is used. It must be removed from the dash with the distributor whenever the distributor is taken off the car for servicing. amperes reached at 1500 R.P.M. or 21 M.P.H.

Mounting:—Distributor is mounted on top of the engine block and is driven by spiral gears and extension shaft from the camshaft. To remove distributor, remove manual advance rod and disconnect primary lead and distributor head with high tension cables intact. Then remove set screw in side of distributor mounting bracket and lift distributor from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler on the side of the distributor housing every month or each 1000 miles. At the same time remove the distributor rotor and saturate the felt oiler in the oil cup in the distributor shaft. Put a small amount of grease on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual control lever in the fully retarded position. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Then fully retard manual spark advance lever and remove cover from timing inspection hole on the top of the flywheel housing. Continue to crank engine until piston No. 1 reaches top dead center. At this point the flywheel mark 'UDC' will be opposite the mark on the flywheel housing. Breaker contacts should begin to separate. If they do not, loosen clamp screw in manual advance arm and rotate distributor in a clockwise direction until contacts begin to separate. Tighten the clamp screw. Check timing by rocking the distributor back and forth. The backlash of the gears should be sufficient to open and close contacts.

Valve Timing:—To check valve timing, set tappet clearance of inlet valve in cylinder No. 6 at .008 inch with pushrod on heel of cam. Then crank engine until piston in cylinder No. 6 is .0125 inch past upper dead center. The intake valve in cylinder No. 6 should open at this point. There is a plug in the cylinder head directly over No. 6 piston to aid in setting this position. After checking valve timing set all tappet clearances at .005 inch.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .025 inch.

STARTER:—Type 6304. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter switch is Type 15380. Brush spring tension is 3 pounds.

NORTH EAST GENERATING, STARTING AND LIGHTING SYSTEM
NORTH EAST IGNITION

Continued from preceding page.

Mounting:—Starter is mounted at left of engine on forward side of flywheel housing by No. 1 S.A.E. flange. To remove starter, disconnect starter cable and remove three flange mounting cap screws. Then slide starter forward and lift from place.

Oiling:—Starter bearings are of the oilless type. They require no attention.

GENERATOR:—Type 5394. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, turn the stud extending through to the outside of the generator endplate. First loosen locknut and then turn stud shifting third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the locknut after making the adjustment. Maximum charging rate with standard car setting is 14-15 amperes reached at 1500 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
0	6.75	600	5	8	800
8.5	8.0	800	11.5	8	1000
15	8.0	1000	14.8	8	1200

16	8.0	1600	13.5	8	1800
13.3	8.0	2000	12.5	8	2000
11	8.0	2400	10.5	8	2400

Generator motoring draws 4 amperes at 6 volts. Shunt field current is 3.2 amperes at 6 volts. Brush spring tension is 12-16 ounces.

Mounting:—Generator is flange mounted at right of engine at rear of timing chain case. To remove generator, disconnect generator lead and remove two flange mounting cap screws. Then slide generator to the rear. Generator drive is by slotted tongue from chain sprocket. Adjustment of timing chain tension is made by loosening generator mounting screws and rotating generator outward around lower stud. The chain should be loose enough to insure quiet running.

Oiling:—Put 2 or 3 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Type 15850. Relay is mounted on top of the generator. Relay closes at 600 R.P.M. when the voltage of the generator reaches 6.75 volts and opens with a discharge current of 0.2 amperes. Charging current at closing of contacts is 1-2 amperes. Relay contacts separate .020-.025 inch. Air gap between relay armature and coil core is .030 inch, contacts closed.

LIGHTING:—Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Parking lights (in head lights) are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 6 amperes. Lighting fuse on block is 20 amperes.

ROLLS ROYCE

PHANTOM MODEL (1927-28)

ROLLS ROYCE GENERATING, STARTING AND LIGHTING SYSTEM DE JON IGNITION

BATTERY:—Exide, Type 3-XC-21-1, 6 volts. Starting capacity (20 minute rate) is 164 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours. The positive (+) terminal is grounded at the starting motor.

IGNITION:—Breaker contacts separate .018-.020 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. A double ignition unit with two heads and two coils is used. Both breakers must operate at the same instant for correct ignition. Distributor is semi-automatic. Manual advance is 15° (distributor). Automatic advance begins at 400 R.P.M. (distributor) and reaches a maximum of 11½° at 2000 R.P.M. Ignition current is 2.5 amperes at 6 volts with engine running and 7.5 amperes at 6 volts with engine stopped. On bench test, coil draws 2.5 amperes at 6 volts with distributor R.P.M. of 221. Spark between needle points at atmospheric pressure will be .800 inch.

Mounting:—Ignition coils and distributor units are mounted on the left of the engine. To remove, disconnect manual advance rod and primary leads and remove distributor caps with cables attached. Then remove four hold-down nuts and lift unit from place.

Oiling:—Put 8 or 10 drops of light engine oil in the oiler on the side of each distributor head every 2000 miles. Put one drop of oil on the breaker arm pivot pin after removing the rotor button every six months. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm every six months.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark lever in the fully retarded position. To set timing, crank engine until piston No. 1 reaches this position. The flywheel mark 'LI' will be opposite the line on the crankcase directly above the flywheel. Make certain that spark lever is fully retarded. If breaker contacts are not separating loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. The contacts in each distributor head should open at the same instant.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are metric longbody. Gaps should be .030 inch.

STARTER:—Part No. A-9860. Starter is connected to the engine through a chain and drives through transmission. Starter is engaged through an electromagnetic clutch. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 86 R.P.M. Brush spring tension is 12-14 ounces. Main starter switch is Model A-2644. Push button switch is Model G-5560.

Starter Data

Torque	R.P.M.	Volts	Amperes
24 lb. ft.	Lock	3.8	750

Mounting:—Starter is mounted at right of transmission case under the floor boards of the front compartment. To remove starter, remove floor boards and disconnect battery cable and drive chain. Then remove caps from two mounting brackets and lift starter from place.

Oiling:—Starter front bearing is oiled from the chassis lubricating system. Put 4 or 5 drops of light oil in rear bearing oiler every six months.

ROLLS ROYCE GENERATING, STARTING AND LIGHTING SYSTEM DE JON IGNITION

Continued from preceding page.

GENERATOR:—Part No. A-9547. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, rotate generator end plate in a clockwise direction increasing charging rate and in a counter-clockwise direction decreasing charging rate. With maximum third brush setting generator output is 26 amperes at 9 volts reached at 1450 R.P.M.

Generator Data

Amperes	Cold Test		R.P.M.	Amperes	Hot Test		R.P.M.
	Volts				Volts		
20	8.25		1350	17	8.75		1460

Main brush tension is 8-10 ounces. Third brush spring tension is 6-8 ounces. Shunt field current is 2.5 amperes at 4 volts.

Mounting:—Generator is mounted at left of engine. To remove generator, disconnect leads and drive coupling and loosen mounting strap. Then lift generator from place.

Oiling:—Generator bearings are oiled from central chassis lubricating system.

CUTOUT:—Part No. A-10194. Cutout is mounted on the generator. Contacts close at 450-475 R.P.M. with a generator voltage of 6.75 volts and open at 400 R.P.M. with a discharge current of 3 amperes. Cutout contacts separate .030 inch. Air gap is .025 inch with contacts open and .012 inch with contacts closed. Cutout is adjusted by turning nut on armature spring.

LIGHTING:—Rolls Royce Part No. A-10257. Switch is mounted on the instrument board. Head lamps are 6-8 volt, 21 cp. double filament Mazda No. 1110. Side lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Instrument board lamps are 6-8 volt, 2 cp. D.C. Mazda No. 62. Tail lamps are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop and backing lamps are 6-8 volt, 21 cp. S.C. Mazda No. 1129.

FUSES:—Generator field fuse is 10 amperes. Lighting fuses are 10 amperes.

Delco-Remy System

Plate No. 1354

BATTERY:—(Series KL and LHI) Willard, Type SJRR-5, 6 volt. Starting capacity (20 minute rate) is 145 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 26 hours.

(Series AA) Willard, Type SJRR-6, 6 volt. Starting capacity (20 minute rate) is 160 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 30 hours. The negative (—) terminal is grounded. Battery is mounted under the driver's seat.

IGNITION:—Coil Model 2178. Distributor Model 4009 (5208 on KL Series). Breaker contacts separate .020-.0275 inch. They are made of tungsten. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Distributor is semi-automatic. Maximum manual advance is 40° (crankshaft). Automatic advance begins at 700 R.P.M. and reaches a maximum of 20° (crankshaft) at 1600 R.P.M. Breaker arm spring tension is 16-20 ounces.

Mounting:—Ignition coil is mounted on the engine side of the dash. Distributor is mounted at right of engine. To remove distributor, disconnect primary lead and manual advance rod. Then remove distributor head with high tension cables intact. Remove manual advance stop screw and lift distributor from place.

Oiling:—Put 8 or 10 drops of light engine oil into each distributor oiler every two weeks. If the car is driven more than 500 miles in two weeks, this care must be given every 500 miles. Repack the distributor housing with medium soft cup grease up to the advance ring and yoke once a season. Apply a little vaseline to the rotor track occasionally during the first 2000 miles, after this, the track will be glazed, and it will be necessary to keep the track wiped clean with a clean cloth. Apply a very small amount of vaseline about the size of a match head to the surface of the breaker cam every 2000 miles.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark control lever in the fully retarded position. To check timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully retard spark control lever and continue to crank engine until piston No. 1 reaches top dead center when the flywheel mark 'UD' will be opposite the indicator on the flywheel case. If breaker contacts do not separate at this point, loosen lock screw in center of breaker cam and rotate cam until contacts begin to separate. Tighten the screw and make certain that the rotor is under the segment connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Gaps are .030 inch.

STARTER:—Model 339 (Series LHI), Model 355 (Series AA and KL). Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2 1/4-2 1/2 pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	60
19 "	Lock	4	500

Mounting:—Starter is mounted at right of engine on rear side of flywheel housing. To remove starter, disconnect starter cable and remove large pilot mounting screw. Then slide starter to rear and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the starter bearing oilers every month or each 1000 miles.

Continued on reverse side.

GENERATOR:—Model 258. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush by means of the handle on the third brush mounting plate. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Maximum charging rate is 16-18 amperes reached at 1600 R.P.M.

Generator Data	
Amperes	R.P.M.
5.....	700
11.....	1000
16-18.....	1600
15.....	2000

Generator motoring draws 5 amperes at 6 volts. Shunt field current is 2 amperes at 6 volts. Brush spring tension is 1¼-1¾ pounds each.

Mounting:—Generator is base mounted at left of engine. To remove generator, disconnect generator lead and remove hold-down screws in base. Then lift generator from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every month or each 1000 miles.

RELAY:—Relay is mounted on the generator. Relay closes at 8-9 M.P.H. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-3 amperes. Relay contacts separate .025-.035 inch. Air gap between relay armature and coil core is .015-.020 inch, contacts closed.

LIGHTING:—Switch Model 1246 and 1257. Head lamps are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Auxiliary head lamps and side lamps are each 6-8 volt, 4 cp. S.C. Mazda No. 81. Stop lamp is 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dome, dash and tail lamps are each 6-8 volt, 2 cp. S.C. Mazda No. 61.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on back of the switch. It begins to operate with 25-30 amperes limiting the current flow to 10-15 amperes until the short circuit is removed.

AMERICAN BOSCH GENERATING AND LIGHTING SYSTEM

BATTERY:—Exide, Type 3-XC-13-1, 6 volt. The negative (—) terminal is grounded. Battery is mounted under the rear seat.

GENERATOR:—Model 1272. The direction of rotation is clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, on early generators loosen the nut on generator end plate holding third brush mounting plate and shift third brush. Shifting the third brush in a clockwise direction increases the charging rate and in the opposite direction decreases the charging rate. Tighten the nut after making the adjustment. On later model generators, shift the third brush by inserting a special Bosch key in the hole provided on the end plate and turning the key. The third brush may be shifted by hand if the key is not available by first removing the commutator cover band. The third brush mounting plate is held in any desired position by friction clamp washers. The maximum charging rate is 17-19 amperes reached at 1100-1300 R.P.M. or 30 M.P.H.

Generator Data

Running as a motor, generator draws 6.6 amperes at 6 volts. Shunt field current is 6 amperes at 6 volts. Generator brush spring tension is 1½-1¾ pounds each.

Mounting:—Generator is mounted in pump pit. To remove generator, disconnect lead and loosen mounting strap. Then lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Relay closes at 480 R.P.M. or 15 M.P.H. when the voltage of the generator reaches 6.5-7.5 volts and opens at 350 R.P.M. or 10 M.P.H. with a discharge current of 1-3 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.030 inch. Air gap between relay armature and coil core is .010 inch, contacts closed.

LIGHTING:—Clum Switch Model 10073. Mounted on the instrument board. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Auxiliary lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Side, dash and dome lights are 6-8 volt, 6 cp. S.C. Mazda No. 81. Stop and tail lights are 6-8 volt, 6 cp. S.C. Mazda No. 81.

FUSES:—Generator field fuse is 7.5 amperes. Lighting fuse on switch is 10 amperes.

BATTERY:—Willard, Type SJWR-3, 6 volt. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 105 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 18 hours. Battery has 11 plates, each 5 3/4 inches wide, 5 1/4 inches high and 1/8 inch thick. Battery is mounted under the floor boards on the right frame member.

IGNITION:—Coil Model 525E. Ignition coil is mounted on the dash. Ignition current is 1/2-2 amperes at 6 volts with engine running, and 4-5 amperes at 6 volts with engine stopped.

Distributor Model 636Y. Breaker contacts separate .020-.025 inch with contact arm on lobe of cam. Adjust contact opening by loosening lock nut on stationary contact stud and turning stud. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension should be 14-16 ounces. Distributor is semi-automatic. Maximum manual advance is 15° (engine). Automatic advance begins at 450 R.P.M. of the engine. Maximum automatic advance is 32° reached at 3000 R.P.M.

Mounting:—Distributor is mounted on accessory bracket at right of engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor housing and turn down one turn every 1000 miles. Every six weeks remove distributor head and rotor and put 3 or 4 drops of light oil in the wick oiler.

Timing:—Breaker contacts separate when the piston entering power stroke reaches a position 7 1/2 degrees after top dead center with the manual spark advance fully retarded. To set timing, crank engine until piston No. 1 reaches top dead center on compression stroke. At this point the flywheel mark 'UP-DC-1-6' will be opposite the indicator. Then advance spark lever exactly one half. Breaker contacts should begin to separate. If they do not, loosen advance arm clamp screw and rotate distributor housing until contacts begin to separate. Tighten the clamp screw. Make certain that segment directly opposite rotor is connected to spark plug in cylinder No. 1 and connect remaining plugs in order 4-2-6-3-5 counter-clockwise around the distributor.

Firing Order:—The firing order is 1-4-2-6-3-5.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 5/8 inches; stem diameter, 5/16 inch; stem length, 4 7/8 inches. Valve lift, 5/16 inch. Spring pressure, 50 pounds. Tappet clearance, .006 inch hot. Inlet valves open 5° after top dead center and close 53° after lower dead center. Flywheel is marked 'IN-OP-1-6' at point of inlet opening.

EXHAUST VALVES:—Head diameter, 1 1/2 inches; stem diameter, 5/16 inch; stem length, 4 7/8 inches. Tappet clearance, .006 inch hot. Valve lift, 5/16 inch. Spring pressure, 50 pounds. Exhaust valves open 58° before lower dead center and close 10° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 720-N. Starter is connected to the engine through an outboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 100 R.P.M. drawing 275 amperes at 4.65 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 406-J.

BATTERY:—Willard, Type SJWR-4, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Plates are $5\frac{3}{4}$ inches wide, $5\frac{1}{4}$ inches high and $\frac{1}{8}$ inch thick. Battery is mounted under the front floor boards on the right frame member.

IGNITION:—Coil Model 525-E. Coil is mounted on the dash. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 636-X. Breaker contacts separate .020-.025 inch. Adjust contact opening by loosening lock nut on stationary contact stud and turning contact stud. Resurface contacts with a fine flat contact file or on a medium hard oil-stone. Breaker arm spring tension is 14-16 ounces. Distributor is semi-automatic. Maximum manual advance is 15° (engine). Automatic advance begins at 550 R.P.M. of engine. Maximum automatic advance is 25½° reached at 2400 R.P.M.

Mounting:—Distributor is mounted on special bracket at front of engine. To remove distributor, disconnect manual advance rod and primary lead and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor with medium cup grease and turn down one turn every 1000 miles. Every six weeks remove the distributor head and rotor and put 4 or 5 drops of light oil in the wick oiler.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position $7\frac{1}{2}$ degrees after top dead center on the flywheel with the manual spark fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Continue to crank engine until piston reaches top dead center when the mark 'UP-DC-1-6' on the flywheel will be directly under the pointer in the flywheel case. Advance spark lever exactly one half. If breaker contacts do not separate at this point, loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and make certain that the segment opposite the rotor button is connected to the spark plug in cylinder No. 1. Connect the remaining plugs in the order 5-3-6-2-4 counter-clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 723-B. Starter is connected to the engine through a special chain and sprocket drive and overrunning clutch. The direction of rotation is clockwise (armature), looking at the commutator end. Starter cranks the engine at 95 R.P.M. drawing 250 amperes at 4.75 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 406-B.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	1000	5	70
70 "	Lock	3.25	600

Torque and R.P.M. measured at sprocket shaft. Direction of rotation of sprocket shaft is clockwise at drive end.

Mounting:—Starter is mounted by special bracket at forward end of engine on right side and drives through chain to forward end of crankshaft. To remove starter, drain and remove radiator. Then remove starter clutch and drive chain. Remove bracket bolt and withdraw pin in hinge. Lift starter from place.

Oiling:—Put 4 or 5 drops of light oil in each of the starter oilers every 1000 miles. Every 3 months oil starter clutch through hole in case. Once each year remove plug in reduction gear case and repack gears with graphite grease.

GENERATOR:—Model 941-L. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. putting the resistance across the contacts in series with the field and cutting down the output approximately 40%. To adjust generator output, loosen the small round headed screw on the end plate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 18 amperes (cold) and 11 amperes (hot) reached at 2096 R.P.M. or approximately 30 miles per hour.

Generator Data

Amperes	Cold Test Volts	R.P.M.	Amperes	Hot Test Volts	R.P.M.
7	7.1	750			
21	8.5	1450	12	7.6	2000
10-12		2500			

Motoring, generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted in a vertical position at the front of the engine and can be removed from the right side. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then lift generator straight up to disengage coupling.

Oiling:—Put 4 or 5 drops of light oil in each of the generator oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the side of the generator. Relay closes at 550 R.P.M. or 7-9 M.P.H. when the generator voltage reaches 7-7.5 volts and opens at 540 R.P.M. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch, Model 484-D. Switch is mounted at lower end of steering column. Head lights are each 6-8 volt, 21-21 cp. (double filament, double contact base) Mazda No. 1110. Side, stop and dome lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—Model 410-C. A vibrating circuit breaker protects the lighting circuits. Circuit breaker begins to operate when current reaches 25-30 amperes and limits the current to 15 amperes while vibrating.

VALVE TIMING:—Specifications:—Head diameter, 1 7/8 inches; stem diameter, 3/8 inch; stem length, 5 3/4 inches. Tappet clearance is .006 inch (hot). Spring pressure, 55-60 pounds. Valve lift, 5/16 inch. Valve stem guides are removable. Oversize valve stems are not made.

Timing:—Inlet valves open at top dead center and close 48° after lower dead center. Exhaust valves open 38° before lower dead center and close 10° after top dead center. Inlet opening of cylinder No. 1 is marked on flywheel by mark 'IN-OP-1-6'.

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Willard, Type SJWR-4, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 125 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 22 hours. Plates are 5 $\frac{3}{4}$ inches wide, 4 $\frac{3}{4}$ inches high, $\frac{1}{8}$ inch thick. Battery is mounted under front floor boards on right frame member.

IGNITION:—Coil Model 525E. Coil is mounted on the dash. Ignition current is $\frac{1}{2}$ -2 amperes at 6 volts with engine running and 4-5 amperes at 6 volts with engine stopped.

Distributor:—Model 658-J. Breaker contacts separate .022 inch. Adjust contacts by loosening lock screw and turning eccentric adjusting screw on stationary contact mounting plate. Resurface contacts with a fine flat file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 25° (engine). Automatic advance begins at 600 R.P.M. Maximum automatic advance is 24° reached at 2900 R.P.M. of the engine. Breaker has two sets of contacts on a single four-sided cam opening alternately at intervals of 45° corresponding to 90° of crankshaft speed. This firing interval is important and must be correctly set. See Timing.

Mounting:—Distributor is mounted on cylinder head. To remove distributor, disconnect primary lead and manual advance rod and remove head with high tension cables intact. Then loosen advance arm clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down two turns every 1000 miles. Remove the distributor head oil and put a small amount of vaseline on the face of the breaker cam every 1000 miles.

Timing:—Synchronization of Contacts:—Use Delco-Remy Part No. 820738 and follow directions on page S-2 to synchronize contacts. This can be checked also if distributor is timed to engine by cranking engine over 90° from point of firing of cylinder No. 1 until piston No. 6 is on top dead center entering power stroke. If second set of contacts do not separate at this point with manual advance lever fully advanced loosen lock screw on breaker plate and turn eccentric adjusting screw until contacts begin to separate. Check contact opening after synchronization. If outside limits of .018-.024 inch, reset at .022 inch and repeat synchronization operation.

Timing Distributor to Engine:—Breaker contacts begin to separate when piston entering power stroke reaches top dead center with the manual spark lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke. This is the upstroke with both valves closed. Fully advance spark lever and continue to crank engine until piston No. 1 reaches top dead center. At this point the flywheel mark 'U-P-D-C-No. 1' will be opposite the timing pointer on the right side of the flywheel housing. If one set of breaker contacts are not separating at this point, loosen advance arm clamp screw and turn distributor until contacts separate. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1. Connect the remaining plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

STARTER:—Model 724-H. Starter is connected to the engine through a manual pinion shift. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine drawing 300 amperes at 4.5 volts. Brush spring tension is 20-28 ounces.

Continued on reverse side.

"PRESIDENT" MODEL FA (1928)

DELCO-REMY GENERATING, STARTING SYSTEM

DELCO-REMY IGNITION

Continued from preceding page.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	2850	5.65	70
22 "	Lock	3.1	590

Mounting:—Starter is flange mounted at left of engine. To remove starter, disconnect cable and pedal rod and remove 3 flange mounting capscrews. Then pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in starter bearing oilers every 1000 miles. Once each year remove grease plug in gear compartment and repack gears with medium grease.

GENERATOR:—Model 949-U. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. inserting the resistance across the contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round screw on the generator endplate and remove the commutator cover band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting the maximum charging rate is 10 amperes (hot) or 20 amperes (cold) reached at 1650 R.P.M. or 23 miles per hour.

Cold Test		Generator Data		Hot Test	
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
4	6.8	700	6	7.0	1050
19.5	8.3	1650	11.5	7.5	2150
12.25	7.75	2800			

Motoring generator draws 5.5 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Generator brush spring tension is 12-16 ounces.

Mounting:—Generator is mounted on left of engine at forward end by special hinge bracket and is driven by the fan belt. To remove generator, disconnect lead and remove adjustment locknut in engine forward mounting flange and swing generator toward engine. Slip off fan belt. Then remove cotter and withdraw mounting bracket hinge pin. Lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in each of the generator bearing oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes at 12½ M.P.H. or 900 R.P.M. when the generator voltage reaches 7-7.5 volts and opens at 10 M.P.H. or 720 R.P.M. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 484-D. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact using second filament instead of dimming) Mazda No. 1110. Side, stop, dome and corner lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81. Dash and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—Model 410-C. A vibrating circuit breaker is mounted on the dash to protect the lighting lines. The circuit breaker begins to operate with a current flow of 25-30 amperes. While vibrating it limits the current to 15 amperes.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 21/32 inches; stem diameter, 3/8 inch; stem length, 4 3/4 inches. Valve lift, 11/32 inch. Spring pressure, 45-50 pounds. Tappet clearance, .004 inch (hot). Inlet valves open 5° after top dead center and close 45° after lower dead center. The point of inlet opening is marked on the flywheel by 'IN-OP-1-8'.

EXHAUST VALVES:—Head diameter, 1 9/16 inches; stem diameter, 3/8 inch; stem length, 4 3/4 inches. Valve lift, 11/32 inch. Spring pressure, 45-50 pounds. Tappet clearance, .006 inch (hot). Exhaust valves open 40° before lower dead center and close 12° after top dead center. Valve stem guides are removable. Oversize valve stems are not made.

SERIAL NOS. 87226 UP (131" WB) 70926 UP (145" WB)
DELCO-REMY GENERATING, STARTING AND LIGHTING SYSTEM
DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type A-617-SH, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 170 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 32 hours. Battery has 17 plates per cell each 5 1/4 inches high, 5 5/8 inches wide and 1/8 inch thick. Battery is mounted under the left front seat.

IGNITION:—Coil Model 527-A (2 used). Coils are mounted on hood at right of engine. Each coil fires one set of spark plugs and ignition circuit of each coil is entirely independent except that only one distributor is used. Ignition current is 2 amperes at 6 volts with engine running and 6 amperes at 6 volts with engine stopped per coil.

Distributor Model 4028. Breaker contact gap is .015-.020 inch with contacts fully open. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 40° (engine). Automatic advance begins at 400 R.P.M. (engine). Maximum automatic advance is 20° at 2600 R.P.M. There are two sets of breaker contacts operating on a single cam each controlling one coil and firing one set of plugs. The contacts must be synchronized for correct ignition. (See Timing.)

Mounting:—Distributor is mounted on special accessory bracket at right front of engine. To remove distributor, disconnect manual advance rod and primary leads. Remove head with high tension cables intact. Then remove manual advance stop screw and lift distributor straight up.

Oiling:—Put 8 or 10 drops of light oil in the oiler every 750 miles. Put a small amount of vaseline on the face of the breaker cam every 1000 miles.

Timing:—**Synchronization of Contacts.** Synchronize contacts before setting timing. Two sets of contacts are used on a single cam. They must open at the same instant to fire both spark plugs in each cylinder simultaneously. Connect a six volt lamp in each primary circuit. Crank engine slowly. Both lamps should go out at the same instant. If they do not contacts must be synchronized. Loosen 4 lock screws on breaker plate and shift plate until correct adjustment is obtained. Tighten the lock screws and check contact gap. It must be within limits of .015-.020 inch. This is important to secure correct high speed performance of car.

Timing of Distributor:—Breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the spark advance lever advanced approximately 7/10. To check timing, crank engine until piston No. 1 reaches top dead center on compression stroke with flywheel mark 'Top C 1&8' in center of inspection hole in upper flywheel housing. Then advance spark lever approximately 7/10 of range to a position similar to "8:30" on a clock dial. Breaker contacts should separate at this point with dash ammeter indicating 12 amperes discharge. If ammeter indicates 6 amperes discharge the contacts are not synchronized. To set timing, remove rotor and loosen screw in center of breaker cam. Rotate cam until contacts begin to separate and tighten lock screw. Make certain that segment over rotor brush is connected to spark plug in cylinder No. 1 and connect spark plugs in following order clockwise around distributor head: 1R-8L-6R-3L-2R-7L-5R-4L-8R-1L-3R-6L-7R-2L-4R-5L.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 18 MM. metric. Gaps are .022 inch.

VALVE TIMING:—**Specifications:**—Head diameter, 1 19/32 inches; stem diameter, 3/8 inch; valve length, 6 11/32 inches (over all). Valve stems threaded with 3/8-24 S.A.E. thread. Valve lift is 1 1/32 inch. Spring pressure, 56 pounds with valve closed (spring length, 2 27/64 inches) and 102 pounds with valve open (spring length 2 5/64 inches). Tappet clearance or lash between valve cap and cam is .028 inch.

Valve Timing:—Inlet valves open 10° past top dead center and close 50° past lower dead center. Exhaust valves open 46° before lower dead center and close 10° past top dead center. The 10° point is 1 7/64 inches past top dead center.

To Set Valve Timing:—Cam shaft sprocket should be removed from camshaft

Continued on reverse side.

STUTZ
MODEL BB (1928)

Continued from preceding page.

and automatic adjusting sprocket in upper chain must be off the engine. Crank engine until flywheel mark 'EX CL 1 & 8 IN OP 1 & 8' is in exact center of inspection hole in upper flywheel housing. This mark is $1\frac{7}{64}$ inches on flywheel after top dead center mark and engine can be timed from piston position. Then turn camshaft until heel of cam is directly over No. 1 valve (exhaust valve in No. 1 cylinder) and set clearance between cam and valve cap at exactly .028 inch. This is very important. Then turn camshaft in direction of rotation (clockwise from front) until exhaust valve has just closed. This can be determined by oscillating valve back and forth by means of an adjusting rod inserted in the valve cap hole. The additional force required to oscillate the valve after it is seated is perceptible. Then mesh camshaft sprocket in chain and rotate sprocket counter-clockwise to take up all slack in driving side of chain. Line up holes in camshaft sprocket and camshaft flange by slipping the upper chain one tooth at a time on the transfer sprocket. Then install the four cap screws mounting sprocket on camshaft flange. Mesh automatic adjusting sprocket and insert eccentric adjusting hub. Wind up spiral spring $1\frac{1}{2}$ turns to take up slack and insert spring tongue in nearest slot in stud. Assemble plain washer and insert cotter.

STARTER:—Model 726-C. Starter is connected to the engine through a clutch and manually operated pinion shift connected with the starting switch. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 200 R.P.M. Brush spring tension is 24-28 ounces.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000.....	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at left of engine on forward side of flywheel housing. To remove starter, disconnect cable and starting switch rod. Remove 3 flange mounting cap screws and pull starter forward from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model 391. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush system combined with a thermostat. Thermostat contacts open at 165 degrees F. inserting a resistance in the field circuit and reducing the output approximately 50%. To adjust generator output, remove commutator cover band and shift the third brush mounting plate. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in position by friction washers. The maximum charging rate is 18 amperes reached at 1600 R.P.M. or 30 miles per hour.

Generator Data					
Cold Test			Hot Test		
Ampers	Volts	R.P.M.	Ampers	Volts	R.P.M.
22-24	8.4	1400	10-12	7.5	1600

Shunt field current is 1.8-2.3 amperes at 6 volts. Brush spring tension is 16-20 ounces.

Mounting:—Generator is mounted by special flange at rear of accessory bracket on right of engine. The water pump is driven by an extension of the generator shaft. To remove generator, disconnect water pump drive coupling and generator lead. Remove three flange mounting cap screws and pull generator to rear.

Oiling:—Put 4 or 5 drops of light oil in the oiler on the commutator end of the generator every 750 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay closes when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.020 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Switch Model 1315. Switch is mounted on lower end of steering column head. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base) Mazda No. 1110. Auxiliary head and side lights are each 6-8 volt, 6 cp. S.C. Mazda No. 81. Stop, backing and corner lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Dash, tail and tonneau lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

CIRCUIT BREAKER:—A vibrating circuit breaker is mounted on the back of the ignition switch. It begins to vibrate with a current flow of 25-30 amperes and continues with 10-15 amperes.

MODEL 66, STANDARD SIX (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

BATTERY:—Prest-O-Lite, Type 613-JFK, 6 volt, 13 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 102 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 17 hours. Battery is mounted under the driver's seat.

IGNITION:—Coil Model IG-4064. Coil is mounted at left of engine near front. Ignition current is 4 amperes at 6 volts with engine stopped and 2 amperes at 6 volts with engine running.

Distributor Model IG-4146. Breaker contacts separate .020-.024 inch new and .018-.020 inch in service with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 18-20 ounces. Distributor is semi-automatic. Manual advance is 10 degrees (engine). Maximum automatic advance is 15 degrees (engine).

Mounting:—Distributor is mounted on left of engine. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then loosen lock screw on side of bracket and lift distributor from place.

Oiling:—Fill grease cup on side of distributor shaft with medium cup grease and turn down one half turn every week or each 250 miles. Every 500 miles remove distributor head and rotor and put 3 or 4 drops of oil in the wick oiler in the center of the shaft and put one drop of oil on the breaker arm pivot pin. Every 5000 miles put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 5 degrees after top dead center (on the flywheel) with the manual advance lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever. Continue to crank engine until exhaust valve in cylinder No. 6 closes. This point is 5 degrees after top dead center and is the firing position for cylinder No. 1. Loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and connect the segment opposite the rotor with the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—Specifications:—Head diameter, 1 7/16 inches; stem diameter, 5/16 inch; stem length, 5 9/32 inches. Spring pressure, 42 pounds. Valve lift, 5/16 inch. Tappet clearance, .008 inch (hot). Valve stem guides are removable. Oversize valve stems are not made.

Timing:—Inlet valves open 7 degrees after top dead center and close 47 degrees after lower dead center. Exhaust valves open 45 degrees before lower dead center and close 5 degrees after top dead center.

STARTER:—Model MN-4119. Starter is connected to the engine through an out-board Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 1 1/4-1 1/2 pounds each. Starter switch is Model SW-4001. Starter cranks the engine at 150 R.P.M. drawing 175 amperes at 5.2 volts.

Starter Data

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel housing. To remove starter, disconnect cable and remove large mounting screw from housing directly above starter sleeve. Then slide starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GTB-4201. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by prying on the mounting bracket stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The brush and mounting bracket are held in any position by friction between the stud and the end plate. With maximum car setting the charging rate is 18 amperes at 8 volts. With standard car setting, the maximum charging rate is 15 amperes (cold) reached at 1800 R.P.M. or 21 miles per hour.

Generator Data

Generator motors at 525 R.P.M. drawing 3.9 amperes at 6.3 volts. Shunt field current is 3.2 amperes at 6 volts. Brush spring tension is 1¼-1½ pounds each. A five ampere field fuse is mounted on the generator end plate.

Mounting:—Generator is base mounted at left of engine. To remove generator, disconnect lead and drive coupling. Then remove three base mounting screws and lift generator from place.

Oiling:—Put 5 or 6 drops of light oil in each of the generator bearing oilers every two weeks or each 500 miles.

RELAY:—Model CB-4007. Relay is mounted on the generator. Relay contacts close at approximately 8 M.P.H. or 650 R.P.M. of the armature when the generator voltage reaches 6.5-7 volts and open at 570 R.P.M. or 7 M.P.H. with a discharge current of 0-1.5 amperes. Maximum charging current at closing of contacts is 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Soreng-Manigold Lighting Switch. Switch is mounted on lower end of steering column. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 10 amperes capacity.

BATTERY:—Prest-O-Lite, Type 615-JFK, 6 volt, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours. Battery is mounted under the driver's seat.

IGNITION:—Coil Model 525-C. Coil is mounted at front of engine on right side. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 637-H-P. Breaker contacts separate .020-.028 inch. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Set contact gap by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw. Breaker arm spring tension is 15-20 ounces. Distributor is semi-automatic. Maximum manual advance is 15 degrees (engine). Automatic advance begins at 400 R.P.M. of engine. Maximum automatic advance is 28 degrees at 1800 R.P.M.

Mounting:—Distributor is mounted at left of engine. To remove distributor, disconnect primary lead and advance rod and remove distributor head with cables intact. Then loosen clamp screw and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with medium cup grease and turn down one turn every two weeks or each 500 miles. Every 5000 miles remove the distributor head and rotor and put light oil in the wick oiler on the shaft. Put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8 degrees (on the flywheel) before top dead center with the manual advance lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark control lever. Continue to crank engine until the dead center mark on the flywheel is $\frac{7}{8}$ inch (8 degrees) before the indicator on the flywheel case. Then loosen advance arm clamp screw and rotate distributor until contacts begin to separate. Tighten the clamp screw and connect the segment opposite the rotor to the spark plug in cylinder No. 1. Connect the remaining spark plugs in order 5-3-6-2-4 clockwise around the distributor head.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are $\frac{7}{8}$ -18 S.A.E. Standard. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, $1\frac{11}{16}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, 5.5 inches. Valve lift, .4 inch. Spring pressure, 55 pounds. Tappet clearance, .008 inch (hot). Inlet valves open 7 degrees after top dead center and close 47 degrees past lower dead center. The inlet opening point is marked on the flywheel by mark 'IO'.

EXHAUST VALVES:—Head diameter, $1\frac{9}{16}$ inches; stem diameter, $\frac{3}{8}$ inch; stem length, 5.5 inches. Valve lift, .4 inch. Spring pressure, 55 pounds. Tappet clearance, .008 inch (hot). Exhaust valves open 45 degrees before lower dead center and close 5 degrees after top dead center. Closing point is marked by flywheel mark 'EC'. Valve stem guides are removable. Oversize valve stems are not made.

STARTER:—Model 720-P. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Starter cranks the engine at 125-145 R.P.M. drawing 150-175 amperes at 4.9 volts. Brush spring tension is 24-28 ounces. Starter switch is Model 405-D.

Motoring generator draws 6 amperes at 6 volts. Shunt field current is 5 amperes at 6 volts. Brush spring tension is 24-28 ounces.

RELAY:—Model 265-B. Relay is mounted on the generator. Relay contacts close at 9 M.P.H. or approximately 675 R.P.M. of the armature when the generator voltage reaches 7.25 volts and open at 8 M.P.H. with a discharge current of 0-2.5 amperes. Charging current at closing of contacts must not exceed 3 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed.

LIGHTING:—Delco-Remy Switch Model 420-G. Switch is mounted at lower end of steering column. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, dome and tail lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuses mounted on switch and fuse block are 10 amperes.

VELIE
Special Six (1928)
Delco-Remy System

Plate No. 1361A

VELIE

MODEL 88 (1927-28) DELCO-REMY GENERATING, STARTING SYSTEM DELCO-REMY IGNITION

BATTERY:—Prest-O-Lite, Type 615-JFK, 6 volts, 15 plates. The positive (+) terminal is grounded. Starting capacity (20 minute rate) is 120 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 20 hours.

IGNITION:—Coil Model 525-A. Ignition current is 2 amperes at 6 volts with engine running and 5 amperes at 6 volts with engine stopped.

Distributor Model 658-A. Breaker contacts separate .022 inch. Adjust contact opening by loosening lock screw on stationary contact mounting plate and turning eccentric adjusting screw to secure proper contact gap. Resurface contacts with a fine/ flat contact file or on a medium hard oilstone. Breaker arm spring tension is 17-21 ounces. Distributor is semi-automatic. Maximum manual advance is 15°. Automatic advance begins at 300 R.P.M. Maximum automatic advance is 17° reached at 1800 R.P.M. Breaker uses two sets of contacts on a single cam. Contacts open alternately at intervals of 45° corresponding to 90° of crankshaft rotation. This firing interval is very important and must be correctly set. See Timing.

Mounting:—Distributor is mounted on cylinder head in center of block. To remove distributor, disconnect manual advance rod and primary lead and remove distributor head with high tension cables intact. Then loosen clamp screw under distributor and lift distributor from place.

Oiling:—Fill the grease cup on the side of the shaft with medium grease and turn down one turn every 500 miles. Every 1000 miles saturate the wick in the oiler in the center of the shaft with light oil and put a small amount of vaseline on the face of the breaker cam.

Timing:—**Synchronization of Contacts:**—Contacts must be synchronized to secure proper firing interval of 45° between opening of each set of contacts. Use Delco-Remy Tool, Part No. 820738, and follow directions on Page S-2 on synchronizing these breakers. Contacts can be synchronized without tool after distributor is timed to engine. With one set of contacts adjusted to open with piston No. 1 on top dead center, crank engine over 90° until piston No. 6 reaches top dead center. The second set of contacts should begin to open at this point. Adjust by loosening two lock screws on breaker plate and turning eccentric adjusting screw until contacts begin to separate. Tighten the lock screws and check contact opening. If it is outside limits of .018-.024 inch reset contact opening and repeat synchronizing operation.

Timing Distributor to Engine:—One set of breaker contacts begin to separate when the piston entering power stroke reaches top dead center with the manual spark lever fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully retard spark lever and continue to crank engine until piston reaches top dead center. Contacts mounted on stationary breaker plate should begin to separate at this point. If they do not, loosen advance arm clamp screw and rotate distributor until the contacts open. Tighten the clamp screw. Connect the segment opposite the rotor to the spark plug in cylinder No. 1 and connect the remaining plugs in order 6-2-5-8-3-7-4 clockwise around the distributor head. The second set of breaker contacts open 90° after this point when piston No. 6 reaches top dead center.

Firing Order:—The firing order is 1-6-2-5-8-3-7-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E Standard. Gaps are .025 inch.

VALVE TIMING:—**INLET VALVES:**—Head diameter, 1 5/8 inches; stem diameter, .3425-.341 inch; stem length, 5 19/32 inches (over all). Valve lift, 5/16 inch. Spring pressure, 34-38 pounds (closed). Tappet clearance, .006 inch (hot). Inlet valves open at top dead center and close 35° after lower dead center.

EXHAUST VALVES:—Head diameter, 1 19/32 inches; stem diameter, .342-.341 inch; stem length, 5 9/16 inches (over all). Valve lift, 5/16 inch. Spring

DELCO-REMY GENERATING, STARTING SYSTEM
DELCO-REMY IGNITION

Continued from preceding page.

pressure, 34-38 pounds (closed). Tappet clearance, .008 inch (hot). Exhaust valves open 42° before lower dead center and close 5° after top dead center. Valve stem guides are removable. Oversize valve stems are made.

STARTER:—Model 720-Q. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 24-28 ounces. Starter switch is Model 406-A.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	6000	5	65
15 "	Lock	3.15	570

Mounting:—Starter is flange mounted at right of engine on forward side of fly-wheel housing. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Pull starter forward and lift from place.

Oiling:—Put 4 or 5 drops of light engine oil in the starter oilers every 1000 miles.

GENERATOR:—Model 949-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field and thermostat. Thermostat contacts open at 165°F. placing the resistance across the thermostat contacts in series with the shunt field and reducing the output approximately 40%. To adjust generator output, loosen the small round headed screw on the generator end plate and remove the commutator band. Then shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. Tighten the screw after making the adjustment. With standard car setting, maximum charging rate is 19 amperes (cold) reached at 1450 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
19-21	8.5	1450	9-12	7.5	2000

Motoring generator draws 5 amperes at 6 volts. Shunt field current is 4 amperes at 6 volts. Brush spring tension is 14-18 ounces.

Mounting:—Generator is flange mounted at right of engine on rear of timing chain case. To remove generator, disconnect lead and remove 3 flange mounting cap screws. Then pull generator to rear and lift from place.

Oiling:—Put 4 or 5 drops of light oil in the generator bearing oilers every 1000 miles.

RELAY:—Model 265-B. Relay is mounted on the generator. Contacts close at 675 R.P.M. of the generator when the voltage reaches 6.75-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .015-.025 inch. Air gap is .014-.021 inch with contacts closed. Set contact opening by bending brass stop over relay armature. Set air gap after loosening two screws in base of relay armature and inserting feeler between armature and coil core by closing relay contacts by hand and tightening screws.

LIGHTING:—Delco-Remy Switch Model 420-G. Switch is mounted at base of steering column. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Lighting fuses are 10 amperes capacity.

WILLYS KNIGHT

MODEL 56 (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

WILLYS KNIGHT
Model 56 (1928)
Auto-Lite System

Plate No. 1363

BATTERY:—U.S.L., Type 3-HVX-7X4, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 148.5 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 28.4 hours. Battery is mounted on left frame member.

IGNITION:—Coil Model IG-4065. Coil is mounted on right side of engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGA-4042. Breaker contacts separate .020-.025 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until breaker gap is correct with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2400 R.P.M.

Mounting:—Distributor is mounted at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then remove two mounting cap screws and lift distributor from place.

Oiling:—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn every 250 miles. Every 5000 miles remove the rotor and saturate the wick oiler in the center of the shaft with light engine oil and put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 8 degrees before top dead center with the manual spark lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke. This may be determined by removing all spark plugs except No. 1 and cranking engine until compression is felt. Then advance spark control lever. Continue to crank engine until piston reaches firing position when the ignition mark on the flywheel will be opposite the indicator on the flywheel case. Loosen the clamp screw on the advance arm and rotate the distributor until the contacts begin to open. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Champion No. 1. Gaps are .025 inch.

STARTER:—Model MAB-4002. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Brush spring tension is 1 3/4-2 1/4 pounds. Starter switch is Model SW-4001. Starter cranks the engine at 140 R.P.M. drawing 250 amperes at 5 volts.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24 "	Lock	4	725

Mounting:—Starter is sleeve mounted at right of transmission case on rear of flywheel housing. To remove starter, take up front floor boards, disconnect cable and take out large pilot mounting screw in housing directly above starter sleeve. Then pull starter to rear and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side.

WILLYS KNIGHT

MODEL 56 (1928)
AUTO-LITE GENERATING, STARTING SYSTEM
AUTO-LITE IGNITION

Continued from preceding page.

GENERATOR:—Model GAL-4103. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, loosen the commutator cover band and shift the third brush and mounting plate by tapping on the mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction between the mounting stud and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M. or 23 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 24-32 ounces. Generator motoring draws 4.7-5.7 amperes at 6 volts. Shunt field current is 4.2 amperes at 6 volts. A five ampere field fuse is mounted on the top of the generator.

Mounting:—Generator is cradle mounted on the right of the engine. To remove generator, disconnect lead and remove clamp band. Then pull generator to rear to disengage coupling and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator bearing oilers every 500 miles.

RELAY:—Model CB-4104. Relay is mounted on the generator. Relay closes at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch. Switch is mounted on the instrument board. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses on switch are 20 amperes capacity.

WILLYS KNIGHT

MODEL 66-A (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

WILLYS KNIGHT
Model 66-A (1928)
Auto-Lite System

Plate No. 1364

BATTERY:—U.S.L., Type 3-HVX-8X4, 6 volt. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 170 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 33.2 hours. Battery is mounted on right frame member.

IGNITION:—Coil Model IG-4065. Coil is mounted on right of engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGA-4035. Breaker contacts separate .018-.020 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Manual advance is 10 degrees (engine). Maximum automatic advance is 10 degrees (engine).

Mounting:—Distributor is mounted at right of engine on top of oil pump housing. To remove distributor, disconnect manual advance rod and remove head with cables intact. Remove Electrolock switch on dash. Then take out 2 mounting cap screws and lift distributor from place. Electrolock Type 5-A is used. This must be removed with the distributor when the distributor is taken off the car. For full directions on Electrolock see Page S-13.

Oiling:—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn every 500 miles. Every 5000 miles put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 12 degrees before top-dead center with the manual spark lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke. This may be checked by removing all spark plugs except No. 1 and cranking engine until compression is felt. Then fully advance spark lever. Continue to crank engine until ignition mark on flywheel is opposite the indicator when the piston will be 12 degrees before top dead center. Loosen clamp screw and rotate distributor until contacts begin to open. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Champion No. 2. Gaps are .025 inch.

STARTER:—Model MAB-4001. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 1 3/4-2 1/4 pounds each. Starter cranks the engine at 1400 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900		100
3.5 "	1100		200
6.6 "	700		300
10.2 "	410		400
24 "	Lock	4	725

Mounting:—Starter is sleeve mounted at right of engine on forward side of flywheel case. To remove starter, disconnect cable and remove large pilot screw from housing directly above starter sleeve. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued on reverse side.

MODEL 66-A (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

GENERATOR:—Model GRE-4207-A. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush and mounting bracket by tapping third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any position by friction between the mounting stud and the end plate. Maximum charging rate is 18.5 amperes at 8 volts reached at 1200 R.P.M.

Generator Data

Cold Test			Hot Test		
Amperes	Volts	R.P.M.	Amperes	Volts	R.P.M.
2.....	6.75.....	440	2.....	6.9.....	530
5.....	7.0.....	500	5.....	7.1.....	620
10.....	7.2.....	620	10.....	7.5.....	820
13.....	7.5.....	710	13.....	7.8.....	1045
18.....	7.85.....	1240	14.....	8.0.....	1360

Brush spring tension is 20-24 ounces. Generator motoring draws 5.5 amperes at 6 volts. Shunt field current is 4-4.5 amperes at 6 volts. A five ampere field fuse is mounted on top of the generator.

Mounting:—Generator is cradle mounted at right of engine. To remove generator, disconnect lead and remove clamp band. Then pull generator to rear to disengage coupling and lift from place.

Oiling:—Put 8 or 10 drops of light engine oil in each of the generator oilers every 1000 miles.

RELAY:—Model CB-4007. Relay is mounted on the generator. Relay closes at 450-500 R.P.M. of the generator when the voltage reaches 7-7.5 volts and opens at 400 R.P.M. with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 3 amperes. Relay contacts separate .025-.035 inch. Air gap is .015 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch. Switch is mounted on the instrument board. An auxiliary switch on the side of the steering column controls the head light dimming resistance on the lighting switch and the auxiliary head light at the front of the car. Head lights are 6-8 volt, 21 cp. S.C. Mazda No. 1129. Auxiliary head light is 6-8 volt, 32 cp. S.C. Mazda No. 1133. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Side, dash, tail, dome, corner and step lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses on switch are 20 amperes capacity.

WILLYS KNIGHT
Model 66-A (1928)
Auto-Lite System

Plate No. 1364A

WILLYS KNIGHT

MODEL 70-A (1928)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L. Type 3-HVX-7X, 6 volt. Starting capacity is 148.5 amperes for 20 minutes. Lighting capacity is 5 amperes for 28.4 hours. The negative (—) terminal is grounded. Battery is mounted on frame under front floor board on left hand side.

IGNITION:—Coil Model IG-4065. Coil is mounted on right side of engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGA-4042. Breaker contacts separate .020-.025 inch. Set contact gap by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 20 degrees reached at 2400 R.P.M.

Mounting:—Distributor is mounted on the right of the engine. To remove distributor, disconnect manual advance rod and remove Electrolock from instrument board. Then remove distributor head with cables intact and remove two mounting cap screws in distributor base. Lift distributor from place and remove Electrolock and distributor as a unit. For full directions on the Type 5-A Electrolock see Page S-13.

Oiling:—Fill the grease cup on the side of the distributor shaft with pure vaseline and turn down one turn each week or each 250 miles. Every 5000 miles remove the rotor button and saturate the wick oiler in the center of the shaft with light engine oil. Put a small bit of vaseline on the face of the breaker cam under the fiber bumper of the contact arm.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position .026 inch before top dead center with the manual advance lever in the fully advanced position. To check timing, crank engine until piston No. 1 enters compression stroke. This may be checked by removing spark plugs in the other cylinders and cranking engine until compression is felt. Then fully advance manual spark lever and continue to crank engine until ignition mark on the flywheel is opposite the indicator in the clutch inspection hole. This mark is 8° or 51/64 inch before top dead center. At this point the piston will be .026 inch before top dead center and the contacts should separate. To set timing, loosen the clamp screw under the distributor cup and rotate the distributor until contacts begin to separate. Tighten the clamp screw. A variation of 1° or 1/8 inch is allowable in setting the ignition.

Valve Timing:—The Willys Knight engine is of the sleeve valve type. To time sleeve valves with eccentric shaft sprocket removed, remove pipe plug in exhaust manifold opposite No. 6 cylinder and scrape carbon from edges of sleeve ports so that closing of ports can be checked. Then remove clutch inspection plate and crank engine until flywheel mark 'EC' is opposite the pointer on the flywheel case. Place electric lamp over spark plug port in cylinder No. 6 and rotate eccentric shaft in a clockwise direction until the upper edge of the port in the outside port passes the lower edge of the port in the cylinder block on the downward stroke. At this point the ray of lamp from the lamp will be cut off. Then assemble chain on crankshaft, idler and generator sprockets. Insert the eccentric shaft sprocket in chain and change mesh of sprocket in chain one tooth at a time until the five cap screws can be inserted without changing the position of the eccentric shaft or crankshaft. Then tighten the five cap screws holding the sprocket rigidly on the shaft. To set tension of timing chain, turn idler eccentric bushing spring until all slackness is removed from chain. Then give spring one complete turn and insert end in slot of idler stud.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plug diameters are 7/8 inch. Gaps are .025 inch.

Continued on reverse side.

MODEL 70-A (1928)

AUTO-LITE GENERATING, STARTING AND LIGHTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

STARTER:—Model MAB-4002. Starter is connected to the engine through a Bendix drive. The direction of rotation is clockwise, looking at the commutator end. Starter cranks the engine at 140 R.P.M. drawing 250 amperes at 5 volts. Starter switch is Model SW-4001. Brush spring tension is $1\frac{3}{4}$ -2 $\frac{1}{4}$ pounds.

Starter Data

Torque	R.P.M.	Volts	Amperes
.6 lb. ft.	1900	---	100
3.5 "	1100	---	200
6.6 "	700	---	300
10.2 "	410	---	400
24 "	Lock	4	725

Mounting:—Starter is barrel mounted at the right of the transmission case on the rear of the flywheel housing. To remove, disconnect cable and remove pilot mounting screw directly above starter sleeve. Then slide starter to rear and lift from place.

Oiling:—Put 7 or 8 drops of light engine oil in the oiler on the drive end of the starter every two weeks or each 500 miles.

GENERATOR:—Model GAL-4103. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove the commutator cover band and shift the third brush and mounting plate by tapping on the third brush mounting stud with a screwdriver. Shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The mounting plate is held in any position by friction between the mounting stud and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M. or 23 miles per hour.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Brush spring tension is 24-32 ounces. Generator motoring draws 4.7-5.7 amperes at 6 volts. Shunt field current is 4.2 amperes at 6 volts. A five ampere field fuse is mounted on the top of the generator.

Mounting:—Generator is cradle mounted on the right side of the engine. To remove generator, disconnect lead and loosen two nuts on mounting strap. Then disengage coupling and lift generator from place.

Oiling:—Put 7 or 8 drops of light engine oil in each of the generator oilers every week or each 250 miles.

RELAY:—Model CB-4104. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and opens with a discharge current of .5-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch. Lighting switch is mounted on the instrument board. An auxiliary switch to control head lights is mounted on the side of the steering column. Head lights are 6-8 volt, 21-21 cp. (double filament-double contact base using second 21 cp. filament instead of dimming) Mazda No. 1110. Side lights are 6-8 volt, 3 cp. S.C. Mazda No. 63. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63.

FUSES:—Generator field fuse is 5 amperes. Lighting fuses are 20 amperes.

IGNITION:—Coil Model IG-4065. Coil is mounted on engine block on right side. Ignition current is 1-3 amperes with engine running and 3.4-5 amperes with engine stopped.

Distributor Model IGB-4001-A. Breaker contacts separate .020-.025 inch. Set contact opening by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is full automatic. Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 24 degrees (engine) reached at 3400 R.P.M.

Mounting:—Distributor is mounted at rear of generator on right of engine. To remove distributor, disconnect primary lead and remove head with cables intact. Then loosen clamp on shaft housing and lift distributor from place.

Oiling:—Put 5 to 8 drops of light engine oil in the spring oiler on the side of the distributor every 500 miles. Every 5000 miles put one drop of oil on the breaker arm pivot pin and put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 6 degrees before top dead center with the breaker assembly fully retarded. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Then continue to crank engine until the ignition mark on the flywheel (which is 6 degrees before top dead center) is opposite the indicator mark on the flywheel case. Loosen clamp screw on timing arm and rotate distributor until contacts begin to separate. Tighten the clamp screw and make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-3-4-2.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Champion No. 2. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Head diameter, 1 15/32 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch. Spring pressure, 48 pounds. Tappet clearance, .004 inch. Inlet valves open at top dead center and close 40 degrees after lower dead center.

EXHAUST VALVES:—Head diameter, 1 1/16 inches; stem diameter, 11/32 inch; stem length, 5 1/2 inches; valve lift, 5/16 inch. Spring pressure, 48 pounds. Tappet clearance, .006 inch. Exhaust valves open 46 degrees before lower dead center and close at top dead center. Oversize valves are made.

STARTER:—Model MZ-4001. Starter is connected to the engine through a Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2 1/2-3 pounds. Starter cranks the engine at 130 R.P.M.

Starter Data			
Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	
1.5 "	1800	5.2	150
2.5 "	1325	5.0	200
5.0 "	740	4.5	300
7.6 "	220	4.0	400
12.2 "	Lock	4.0	550

MODEL 96 FOUR (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

Continued from preceding page.

Mounting:—Starter is flange mounted on right of engine on forward side of rear motor support. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

GENERATOR:—Model GAL-4102. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush system. To adjust generator output, remove the commutator cover band and shift the third brush in a counter-clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush and mounting bracket are held in position by friction between the stud and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 2075 R.P.M.

Generator Data		
Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
17.2	8.0	2075
14	7.65	2925

Generator brush spring tension is 24-32 ounces. Generator motoring draws 4.7-5.7 amperes at 6 volts. Shunt field current is 4.2 amperes at 6 volts. A five ampere field fuse is mounted on top of the generator.

Mounting:—Generator is mounted at right of engine. To remove generator, disconnect all ignition connections or remove distributor. Then remove generator drive gear with puller and remove clamp band. Lift generator from place.

Oiling:—Put 4 or 5 drops of light engine oil in the oiler at each end of the generator every 500 miles.

RELAY:—Model CB-4104. Relay is mounted on the generator. Relay contacts close at 675 R.P.M. when the generator voltage reaches 7-7.5 volts and open with a discharge current of 0-2.5 amperes. Charging current at closing of contacts is approximately 2 amperes. Relay contacts separate .025-.035 inch. Air-gap is .010-.030 inch with contacts closed.

LIGHTING:—Briggs and Stratton Switch. Lighting switch is mounted on the instrument board. Head lights are each 6-8 volt, 21 cp. S.C. Mazda No. 1129. Stop light is 6-8 volt, 15 cp. S.C. Mazda No. 87. Dash, tail and dome lights are each 6-8 volt, 3 cp. S.C. Mazda No. 63. Dimming is by resistance on switch. An additional resistance is used with head lights for parking.

FUSES:—Generator field fuse is 5 amperes. Lighting fuse on switch is 20 amperes capacity.

MODEL 98 SIX (1928) AUTO-LITE GENERATING, STARTING SYSTEM AUTO-LITE IGNITION

BATTERY:—U.S.L., Type 3-CVX-6X6, 6 volt, 13 plates. The negative (—) terminal is grounded. Starting capacity (20 minute rate) is 115 amperes for 20 minutes. Lighting capacity (5 ampere rate) is 5 amperes for 21 hours. Battery is mounted on left frame member.

IGNITION:—Coil Model IG-4065. Coil is mounted on right side of engine block. Ignition current is 1-3 amperes at 6 volts with engine running and 3.4-5 amperes at 6 volts with engine stopped.

Distributor Model IGB-4009. Breaker contacts separate .020-.025 inch. Set contact opening by loosening lock nut on stationary contact stud and turning up stud until proper gap is secured with breaker arm on lobe of cam. Resurface contacts with a fine flat contact file or on a medium hard oilstone. Breaker arm spring tension is 16-20 ounces. Distributor is semi-automatic. Maximum manual advance is 20 degrees (engine). Automatic advance begins at 800 R.P.M. of engine. Maximum automatic advance is 24 degrees reached at 3200 R.P.M.

Mounting:—Distributor is mounted on rear of generator at right of engine. To remove distributor, disconnect primary lead and manual advance rod and remove head with cables intact. Then loosen clamp screw on side of shaft and lift distributor from place.

Oiling:—Put 5 to 8 drops of light engine oil in the spring oiler on the side of distributor every 500 miles. Every 5000 miles put one drop of oil on the breaker arm pivot pin and put a small amount of vaseline on the face of the breaker cam.

Timing:—Breaker contacts begin to separate when the piston entering power stroke reaches a position 10 degrees before top dead center with the manual spark lever fully advanced. To set timing, crank engine until piston No. 1 enters compression stroke (the upstroke with both valves closed). Fully advance spark lever and continue to crank engine until the piston reaches a position 10 degrees before top dead center when the flywheel mark will be opposite indicator or retard spark lever half way and continue to crank engine until the piston reaches top dead center. Then loosen clamp screw on advance arm and rotate distributor until the contacts begin to separate. Tighten the clamp screw. Make certain that the segment opposite the rotor is connected to the spark plug in cylinder No. 1.

Firing Order:—The firing order is 1-5-3-6-2-4.

Spark Plugs:—Spark plugs are 7/8-18 S.A.E. Champion No. 2. Gaps are .025 inch.

VALVE TIMING:—INLET VALVES:—Inlet valves open 7 degrees after top dead center and close 39 degrees after lower dead center. Tappet clearance is .004 inch.

EXHAUST VALVES:—Exhaust valves open 38 degrees before lower dead center and close 2 degrees after top dead center. Tappet clearance is .006 inch.

STARTER:—Model MZ-4011. Starter is connected to the engine through an inboard Bendix drive. The direction of rotation is counter-clockwise, looking at the commutator end. Brush spring tension is 2 1/2-3 pounds. Starter cranks the engine at 140 R.P.M.

Starter Data

Torque	R.P.M.	Volts	Amperes
0 lb. ft.	Free	6	
1.5 "	1800	5.2	150
2.5 "	1325	5.0	200
5.0 "	740	4.5	300
7.6 "	220	4.0	400
12.2 "	Lock	4.0	550

Mounting:—Starter is flange mounted on rear engine support at right of engine. To remove starter, disconnect cable and remove 3 flange mounting cap screws. Then pull starter forward and lift from place.

Oiling:—Starter bearings are oilless. They require no attention.

Continued from preceding page.

GENERATOR:—Model GAL-4106. The direction of rotation is counter-clockwise, looking at the commutator end. Generator current regulation is by third brush shunt field. To adjust generator output, remove commutator cover band and shift third brush by tapping on third brush mounting bracket. Shift the third brush in a counter clockwise direction to increase the charging rate and in the opposite direction to decrease the charging rate. The third brush is held in any position by friction between the mounting bracket and the end plate. The maximum charging rate is 17 amperes at 8 volts reached at 2025 R.P.M.

Generator Data

Amperes	Volts	R.P.M.
2	6.4	675
6	6.9	835
10	7.3	1025
14	7.65	1275
